1. Partial retention of base profit and partial retention of profit increment. There are two specific systems here. The first is the method established by the State Council in Document No 23 (1980). If the enterprise's profits for a given year are higher than those for the previous year, a predetermined proportion of the amount equal to last year's profit goes to the enterprise as the retained percentage of base profit, while a different proportion, also set by the state, of the increase in profit over the preceding year is assigned to the enterprise as the retained proportion of profit increment. If the enterprise's profit in a given year is lower than that for the previous year, the enterprise retains a percentage of the base profit, calculated in terms of the profit for the year and the established retention percentage. The proportion of base profit to be retained is set by considering the proportion of last year's profits accounted for by that year's expenditures on trial production of new products, scientific research expenditures and employee training expenditures, and the size of the employee benefits fund, the employee bonus fund and the enterprise fund. The percentage of incremental profit which is retained is set at 10, 20 or 30 percent, depending on the difficulty of making profits in different industries. The funds which the enterprise retains from profits are used for the production development fund, the employee benefits fund and the employee bonus fund. No expenditures required to be paid out of funds retained from profits may be covered through further allocations by the state, nor may the enterprise write them off as costs.

This method is a rather good embodiment of the state's, enterprise's and employees' interests. It encourages the enterprise to increase its output, improve quality and increase the amount of money paid to the higher levels. Its shortcomings are: first, that well-managed enterprises which earn high profits but have difficulty increasing them, i.e. primarily enterprises which have high technical and economic indicators, do not benefit much, so that we are "whipping the fastest ox"; second, because of such factors as pricing policy, there is an unequal distribution of benefits and disadvantages among industries and among enterprises.

The other form of this system is the method specified by the province's Document No 128 (1979). After the state plan is completed, the former payment of 5 percent of total wages into the enterprise fund is replaced by a payment of 3 to 5 percent of plan profits to the enterprise as its retained proportion of profit, in addition to which, as a rule 20 percent of the profit increment is earmarked for the enterprise; employee benefits expenditures and employee bonuses are handled by the enterprise as described above.

The advantages of this approach are that it is rather simple and clear and is easy for the enterprise to calculate and implement. In particular, for a 2-year period enterprises need not pay to the higher levels any profit increases generated from their own assets, but instead may add them to their assets, an arrangement which the enterprises especially welcome. Some shortcomings are that the problem of "whipping the fastest ox" and unequal distribution of benefits and disadvantages still remain, and that the employee benefits fund and bonus fund are still tied to total wages.

Enterprises which are using the system of partial retention of base profit and partial retention of incremental profit must take care to act on the basis of the overall situation and must concentrate primarily on improving their management and achieving better economic results. According to relevant provisions of the State Council and the province, a small number of enterprises which, as a result of changes in objective conditions, are experiencing genuine difficulty in implementing the existing system of partial retention of profits, may make certain alterations in accordance with specific conditions. For example, a small number of enterprises which have inadequate production assignments and are experiencing sizeable decreases in profits must first reorganize and consolidate, revise their product structure and increase their output, and if these efforts are still insufficient to guarantee normal employee benefits fund levels and minimum bonus levels, the financial departments must make special allowances for them or carry out an audit in terms of the plan assignments that were handed down and implement the method of partial retention of above-plan profits. In the case of enterprises whose profits are especially affected by increases in state prices for raw and other materials or by decreased sale prices for their products, a suitable adjustment in the proportion of base profit retained may be made. In the case of some enterprises whose retained proportion of base profit established in accordance with State Council Document No 23 (1980) is too high, this proportion should be adjusted downward following suitable work on the case, and held within 40 percent.

Since these methods were implemented, they have acted as a positive factor in bringing enterprise enthusiasm into play, mobilizing employee enthusiasm, and stimulating enterprise and employee concern for output and a striving to increase profits, and have produced rather good economic effects. According to statistics for last year on 211 enterprises experimenting with expanded autonomy which have been circulated by the province, the total industrial output achieved in 1980 was 19.58 percent above that for the previous year and profits realized were up by 29.95 percent from the previous year, exceeding the increase in profits by the state-run enterprises throughout the province by 27.5 percent.

2. Implementation of the profit contract system and partial retention of excess profits in the case of small-profit enterprises. The profit indicators are generally based on the actual amount of profit paid to the higher levels in the previous year, with allowance for the actual circumstances in the present year. When the change in profit is rather large, these indicators are determined yearly, but when profits are rather stable, the percentage is fixed every 3 years. In some cases all above-plan profits go to the plant, while in other cases only a certain percentage is retained; in addition, some localities specify that if prescribed indicator values are not attained, the enterprise must pay a 5 percent penalty. For example, the Sheng County Zisha [4793 4263] Plant paid 60,000 yuan of profits to the higher levels in 1980, while this year its profits contract figure is 80,000 yuan; 10 percent of the profit in excess of the contract figure is paid to the cognizant department, and 90 percent is retained by the plant. As a result, the profit realized in the first half of this year has been 54,200 yuan, an increase of 126.8 percent over the same period last year.

3. A system in which enterprises operating at a loss receive fixed supplemental allocations, excess losses are not made up, and the amount by which losses are decreased is retained, either wholly or in part. In implementing this type of economic responsibility system, the various localities use the following method, depending on the size of enterprise losses, the difficulty of decreasing them or turning a profit, and the plant's specific situation: 1. "Bear half, receive half" of losses. In this case, the enterprise itself bears 50 percent of excessive losses and retains 50 percent of the amount by which losses are decreased. 2. "Bear all, receive all." In this case, excess losses are not made up by the state, and the amount by which losses are decreased is fully retained. 3. Determination of the percentage of losses to be subsidized in terms of product sales volume. This is a very effective method. Enterprises whose loss figure is contracted for show a profit rather quickly and shed their "money-losing" label. For example, the Lizhu Iron Mine in Shaoxing had shown a loss in every one of the 10-odd years since it was constructed. When this method was implemented, the situation showed a rapid change for the better. In the past, losses amounted to 10,000 yuan per day, while now the profit is over 50,000 yuan per day's production, and in the period from last April to this April alone, overall profits for the mine amounted to more than 2 million yuan. The province's 37 enterprises which operate at planned losses or whose losses are based on policy considerations showed a total loss figure of 2.268 million yuan in 1979; in 1980, after implementation of the contract system, they showed a profit of 2.117 million yuan. In the past these money-losing enterprises had no production expansion fund, and the plant was considerably behind as regards employee welfare benefits. Now that the enterprise is showing a profit, not only is it able to exploit unused potential, modernize and renovate with its own resources, but it also has been able to provide some collective welfare and deliver some real benefits to the employees.

4. Linking of bonuses to profits and calculation of bonuses in terms of profits. In this method, bonuses are decoupled from wages and linked to profits instead. Employee benefits in the previous year are compared with profits to determine the bonus ratio, which is approved by the relevant department and is in effect for 3 years. The larger the amount paid to the higher levels, the greater the bonuses obtained, and conversely. The advantage of this method is that the employees' economic interests are closely linked to enterprise management results; "when the water rises the boats float higher," and bonuses go up as profits go up, which

assures large revenues for the state. The disadvantage is that setting the bonus-to-profit ratio in terms of last year's actual figures is a somewhat random method; some enterprises' bonus figures may exceed the prescribed amounts.

5. Partial profit retention by entire industries. In this method the bureau or company is taken as the unit and a base figure contracted for; part of any surplus is retained, with the proportion remaining constant for several years. In addition, the bureau or company and its subordinate enterprises each have a base contract figure and a surplus profit retention percentage set for them. The main feature of this method is that the department (or company) can make suitable adjustments in terms of the quality of individual enterprises' management within the industry as a whole, in terms of such factors as the favorable or unfavorable character of objective circumstances, the difficulty of increasing output and profits, and the size of the contribution made to the state. Ningbo City implemented industrywide partial retention of profit increases for all industry and communications bureaus (or companies), while Jinhua City, Sheng County, Jiangshan County and others are also testing the method. Its advantages are: first, it helps solve the problem of "uneven distribution of benefits and disadvantages" among enterprises; second, it helps in the planning and disposition of the various funds and allows rational organization of production; third, it helps promote readjustment, reorganization and integration of industries. Its weak points are that enterprises with high profits complain that their profits are being skimmed off by low-profit enterprises, and that some enterprises think that some of their powers have been taken away by their cognizant departments. As a result, special attention must be paid to correct handling of relations between the cognizant department and the enterprises and to effective political and ideological work.

6. Replacement of payment of profits by payment of taxes, and responsibility for profit and loss. Under this method, when small enterprises change over from payment of profits to payment of taxes, the interests of state, enterprise and employees are more closely linked together, which helps thoroughly mobilize enterprise and employee enthusiasm, promote the expansion of production and increase earnings, which assures the state financial offices of steadily increasing revenues. The principle of basing the types of taxation and the tax rates on the interests of the state, the enterprise and the employees alike, which helps to mobilize the enthusiasm of all concerned, can be applied with due reference to local conditions. For example, some localities now use the "four taxes" (income tax, profit shortfall adjustment tax, vehicle and boat license tax, land use tax), and the "two fees" (fee for use of fixed assets, fee for use of circulating funds), while some localities make reference to the collective-ownership enterprise method and collect an eight-level graduated income tax. Once payment of profits is replaced by payment of taxes, all after-tax profits go to the enterprise, and the enterprise itself determines their use.

In addition, industrial enterprises under collective ownership which are experimenting with expanded autonomy have implemented the partial retention of profit method in accordance with province specifications, with 4 percent of the specified base profit level being retained the enterprise, while 20, 30 or 40 percent of the profit increment is also retained, depending on the size of the profits and the difficulty of realizing them. Starting this year, collectively-owned enterprises throughout the area will institute the system of "double reduction" for profit increments (collection of half of the income tax that would normally be due, and payment of half of the cooperative fund to the higher levels).

[Question] What forms of economic responsibility system govern the relationship between the enterprise and the employees?

[Answer] Currently, six types of economic responsibility system applying to the relationship between the enterprise and the employees are in existence on a provincewide scale.

1. Computation of wages by piece rate. This is a wage form in which compensation is based on the number of pieces or the quantity of work of a specified quality completed by the worker. Its distinguishing feature is that it links worker compensation directly to worker accomplishment: the more he works the more he earns, and conversely. Compared with a time rate, it more correctly reflects the quantity of work performed by the worker, better embodies the principle of distribution according to work, and mobilizes employee enthusiasm.

After they have set up a job responsibility system and a checking system and have seen to it that quota management is operating properly, enterprises which are fulfilling their production tasks and which are suited to the piece rate system may secure higher-level approval to implement it; either the collective or the individual may be taken as the piece-rate unit. Workers coming onto the piece-rate system will not be awarded the regular production bonuses.

Implementation of the piece rate system must be linked to the enterprise's economic results and must be arranged so that it guarantees quality, decreases labor costs and results in bigger increases in output and profit. Given these preconditions, enterprises retaining a portion of profits may pay piece rate wages out of costs; a suitably decreased profit retention percentage will be computed for them. Wages paid on the piece rate system may not be calculated as part of the bonus fund money accruing to the enterprise under the partial retention of profits system; this prevents double payment and waste.

This form is already being spread in some branches, enterprises and trades in the construction, transport, cigarette and textile sectors. As to specific measures, some organizations are using the direct unlimited piece rate system, in which wages are calculated according to a single piece rate with no limitations, a method which is suited to work in which individual output from manual or machine operations can be calculated. Some organizations are using a progressive piece rate system, in which wages are calculated using a graduated piece rate based on the size of the quota achieved by the worker; this is suited to enterprises and types of work in which above-quota production is rather difficult. Other organizations are using the limited piece rate system, in which the increase in wages calculated by the piece rate system is limited to 30 percent of the standard wage. After the Ningbo Cigarette Factory instituted the limited piece rate system in July, cigarette output increased from 890 cartons a day to 1,030 cartons a day with the same equipment and personnel.

2. The above-quota piece rate system. This is a piece rate system in which the individual or a small group such as a shop, shift or section is taken as the unit, and the base wage is paid for fulfilling the quota and a piece rate is paid for above-quota production, so that the more the output exceeds the quota the higher the wage; those who do not meet the quota are penalized 5 to 10 percent. Within the group, distribution is carried out in accordance with the technical difficulty, labor strength, conditions and responsibility for the various types of work. Enterprises which implement this system stop paying regular production bonuses and overtime. This method not only protects the interests of older workers, but also mobilizes new workers' enthusiasm, so that all enterprises with effective leadership groups and a good basis for management work which have full production assignments can implement it on a trial basis. At present, some enterprises in Hangzhou, Ningbo and Shaoxing cities and Yuhang, Sheng and Lishui counties are testing this method.

3. The floating wage system. This system involves making a large proportion of the original wage (generally between 70 and 80 percent) a fixed wage and designating a small part of the original wage plus the bonus (including bonuses obtained from partial retention of profits) or an allowance as the floating wage. For example, after the Ningbo Municipal Moving Company adopted this wage method last December, handling efficiency was increased by 43 percent, and the amount of profits remitted to the higher levels was doubled, while the workers' income was increased by 59.2 percent compared with the fixed wage system.

4. Computation of bonuses according to bonus points. This replaces the evaluation bonus with a points bonus. Various technical and economic indicators such as output, quality, variety, consumption and expenditure are broken down into a number of smaller indicators which are applied at each level down to the shop, shift and individual worker; bonus point values are assigned for each indicator and the points are tallied on a monthly basis. In some cases an economic contract is also signed to specify rights and responsibilities. This method is already in rather widespread use. The 23 silk plants in the Hangzhou City silk system have implemented it. Starting in 1980, the Fuhua Silk Plant in Hangzhou went on to combine the bonus point system with the above-quota piece rate bonus system, awarding bonuses in terms of above-quota piece production and bonus-point totals; the plant's headquarters set standard point values and instituted the following regulations: 25 points were to be awarded to a worker who fulfilled his quota, with 3 additional points to be added for each 1 percent overfulfillment, while those who did not meet their quotas were to have 3 points deducted for each 1 percent shortfall; those who met quality quotas were awarded 45 points, with an additional 10 to 15 points awarded for eliminating second-quality products; those who met conservation indicator targets received 10 points, and an additional 10 points for safe, enlightened production, while those who were responsible for accidents lost their month's bonus. Implementation of this system allowed a rather small bonus sum to have a rather large effect, and last year records were set in all technical and economic indicators. This year, although the size of bonuses has been decreased somewhat, the state plan is being overfulfilled every month.

5. Computation of bonuses according to output. This is a system in which bonuses are paid in terms of output. The Sheng County Cement Plant specified that those who fulfilled the state plan would receive 1 yuan in bonuses per ton. Sections

which overfulfilled the plan by 50 percent received a bonus of 1.5 yuan per ton, and those which overfulfilled the state plan by more than 50 percent received a bonus of 3 yuan per ton. The Sheng County Electromechanical Plant specified that the basic bonus would be paid when the plantwide monthly output value was 300,000 yuan and the sales figure reached 250,000 yuan; the bonus would be increased an average of 1 yuan per worker for each 50,000 yuan overfulfillment of output value and sales quotas.

6. Setting up a "several specifications, one bonus" system for leadership cadres and management personnel. Most front-line workers have hard and fast quotas, and it is relatively easy to calculate a bonus by a point system, but there are no hard and fast quotas for leadership cadres and management personnel, so that it is rather hard to compute bonuses on the basis of a point system. Many enterprises set bonuses for mangement cadres slightly lower than the average for the production workers. For example, the Jinhua Cotton Cloth Mill has a rather good method. It instituted a "six specifications, one bonus" system for plant-level leadership cadres, involving specified output value, specified profit, specified variety, specified output volume, specified quality and specified consumption. It declared that the leadership cadres had complete responsibility for all of the enterprise's monthly plan indicators, and a proportionality factor for awarding or decreasing bonuses was specified for each indicator. Those who fulfilled their quotas for all six indicators received the full bonus, and those who failed to fulfill three of the indicators had their individual wages cut by 20 percent. A system of "seven specifications, one bonus" was instituted for shop superintendents and shift foremen, consisting of output volume targets, quality targets, consumption targets, safety targets and the like. Those who met all the targets received the full bonus, and if the two main indicators of output volume and quality were overfulfilled, they could receive an additional 10 percent. If the two main indicators of output volume and quality and two secondary indicators were not met, 2 percent was deducted from their wages. The Lanxi County industrial enterprises prescribed that provided the four yearly indicators of output volume, quality, profit and provision of goods in accordance with contracts were met, the plant-level leadership would receive a bonus to be calculated in terms of the percentage by which the enterprise overfulfilled the quota for payment of profits to the higher levels. If the profit quota was not met, 2 to 5 percent would be deducted from the standard individual salary of the main leadership personnel for a period of 3 to 6 months.

[Question] To what problems should industrial and communications enterprises implementing economic responsibility systems pay attention, and what principles should they follow?

[Answer] This province is still in the investigation and experimental stage in its implementation of economic responsibility systems in the industrial enterprises, and we can only say that the experience gained thus far is preliminary. The specific methods described above are relatively practicable. But in studying and spreading this experience, we must refer to the specific situations of the individual geographic areas, departments, and enterprises, take a realistic approach, be creative in adopting it, continually investigate new circumstances which arise during practice, solve new problems, and gradually improve the techniques.

At the same time, implementation of the economic responsibility systems must proceed side by side with enterprise reorganization; establishing an economic responsibility system and making it work properly is the point of breakthrough in enterprise reorganization, which can bring the enterprise internal economic impetus, strengthen its basic work, and improve the quality of management and administration.

No matter what type of economic responsibility system an enterprise implements, it must grasp the following points:

1. Simultaneous reference to the interests of state, enterprise and employees. The primary requirement is to assure large revenues to the state; the enterprise must use appropriate measures and appropriate methods to pursue proper economic interests, but it must never violate law and discipline or engage in deception. In the relationship between state and enterprise, the key point is to assure rational base numbers for performance contracts and rational proportional shares; in distribution within the enterprise, the key is to develop norms for average and advanced work and rational unit-values for computing work results. Once large revenues for the state are assured, everything should be done to take account of enterprise and employee interests and to mobilize enterprise and employee enthusiasm. Certain enterprises suffering special hardship may be allowed to keep their profits for a specified period of time so as to allow them greater income and give them time to rest and recuperate and to build up their financial resources.

2. Specific forms and methods should be realistically based, take account of local conditions and use the forms best suited to them, rather than imposing arbitrary uniformity. Nor should they rush headlong into action, and enterprises in which the conditions are right should not force their implementation. In addition, account should be taken of "neighbors," and of relations between all types of personnel.

3. The awarding of a percentage of profits to the enterprise and contracting for profits, and the computation of bonus points or implementation of the piece rate system within the enterprise, must both take full account of variety, output volume, quality, consumption and safety indicators; and such one-sided tendencies as ignoring product quality and production safety or single-minded pursuit of quantity in profit should be opposed, overall fulfillment of the state plan should be guaranteed, and a sense of responsibility toward the consumer should be manifested.

4. Rights and responsibilities should be made clear, and methods should be simple and easy to implement. The various yardsticks must be subjected to free and thorough discussion by the workers, and once they are fixed, they must not be changed lightly, so as to maintain stability and continuity of policy.

5. Vigorous political and ideological work must be done to guarantee the effectiveness of these systems. Establishing economic responsibility systems in industrial enterprises and keeping them in good working order constitutes an important reform of the industrial management system. Accordingly, this work requires a positive orientation, a variety of methods, stable policy, an active and prudent approach, and implementation with leadership and a program; and the relevant departments must provide support so that it progresses in a healthy fashion.

GENERAL

ECONOMIC RESPONSIBILITY SYSTEM IN FINANCE AND TRADE

Kunming YUNNAN RIBAO in Chinese 21 Sep 81 p 1

[Article: "Push the Economic Responsibility System in Finance and Trade Vigorously and Steadily"]

[Text] All those finance and trade enterprises that practice the economic responsibility system in our province have undergone changes in both the quality of service and the economic results. Practice has proven that taking the economic responsibility system as a breakthrough point to restructure the system of commercial management will benefit the economic readjustment and stimulate the market. All localities should take a positive attitude with regard to the economic responsibility system, strengthen their leadership, and unswervingly attend to the job of instituting the economic responsibility system.

In pushing the economic responsibility system, the finance and trade enterprises should correctly handle not only the relations between the state, enterprises, and workers but also their relations with consumers and producers. This is determined by the characteristics of finance and trade activities. After putting the economic responsibility system into practice, enterprises must take care of the interests of the state, enterprises, and workers. They are not permitted to change the higher degree of public ownership into a lower degree of public ownership or to squeeze state revenues. They must see to it that, under the premise of ensuring fulfillment of the quotas of profit deliveries, enterprises retain more profits and workers get more income. Egalitarianism should be overcome when issuing wage bonuses. The characteristics of commerical enterprises and service trades are to serve the consumers directly. This demands that commercial enterprises and service trades safeguard the interests of the masses and adhere to the direction of their services. It is even more important that state-operated commercial enterprises and service trades, which are the main fronts for safeguarding the daily needs of the people, refrain from the practice of handling only the profitable commodities and not the less profitable commodities or moneylosing commodities. They must hold themselves responsible to the market. Some enterprises practicing the economic responsibility system concentrate on profits and wage bonuses and disregard the orientation of their operation and the quality of their services. All localities should intensively teach finance-trade cadres and workers to promote one policy (developing economy and ensuring supply), two services (service to production and service to people's livelihood), and three viewpoints (political viewpoint, production viewpoint, and mass viewpoint). At the same time, the education should be supplemented with economic means and administrative measures to guide the enterprises in their proper direction of operation to the satisfaction of the state, enterprises, workers, and consumers. In putting the economic responsibility system into practive, the commercial purchase departments, which have close connections with the producers, should take the promotion of production as an important feature of proficiency assessment.

The finance and trade departments are economic departments organizing the circulation of commodities and the circulation of money. In their activities, innumerable trades, complicated categories, wide areas, and different situations are involved. For this reason, the system of economic responsibility should be instituted in light of different conditions and in a manner suited to local conditions of each store, rather than insisting on "arbitrary uniformity." For example, a distinction should be drawn between town and country, between plains areas and mountain areas, between wholesale and retail, between large stores and small ones, between commercial enterprises and service trades. At the same time, action should not be precipitate. We may make some experiments, acquire experience, and popularize it step by step. Those enterprises that have instituted the system should keep summing up their experiences and perfecting the system. Those that have not instituted the system and are in a position to do so should institute the system quickly. Those enterprises marked by confused management, weak leading groups, and numerous problems should be reorganized and, on that basis, the system should be instituted. In this way, there will be better prospects for thriving growth of finance and trade in our province.

REASONABLE CONTRACT QUOTAS URGED

Jinan DAZHONG RIBAO in Chinese 24 Sep 81 p 1

[Article by staff reporter Wang Juntian [3769 6874 3944]: "The Assigned Quota Should be Reasonable"]

[Text] The industry, communications, finance, and trade enterprises in the Jinan municipality have popularized various forms of economic responsibility and have achieved marked economic results; but there have arisen some problems that merit attention. One problem is that the quotas of profits assigned to some enterprises and units are too low and the profits are shared irrationally between the state and enterprises, with the result that the share going to the state is decreased and the income earned by individuals is excessive, and that, among enterprises of the same type and in the same trade, some gain from the system but others lose. Take one restaurant for example. With a long record of losses, this restaurant lost more than 3,000 yuan for the first 7 months last year. Beginning the fourth quarter of last year, the responsible department decided to put the restaurant under the system of contract profits and sharing above-quota profits with the state. Taking account of the average amount of profits delivered to the state over the past 3 years, that is, 370 yuan, at first the department set the quota of profit delivery at 400 yuan. When a contract was signed this year, the quota was set at 800 yuan. But the two quotas did not take into account the advanced level of the same trade in the municipality nor the record level of profit delivered by the restaurant in November 1976, that is, 3,400 yuan. As a result of executing the contract, the restaurant made 27,700 yuan profits from January to August, averaging 3,550 yuan a month, 4.4 times the amount of quota assigned. In August this year, wage bonuses averaging 49.60 yuan per capita were paid to its workers and the amount of profits delivered to the state averaged only 16 yuan per capita. The Huimin Restaurant on Weisanlu, which operated under basically the same conditions, put into practice the system of retaining a portion of profits as wages to its workers. From January to August, the restaurant earned 27,700 yuan in profits and in August delivered to the state profits averaging 37 yuan per capita and paid wage bonuses averaging 15.30 yuan per capita. Thus, the contribution made by each of the Huimin Restaurant workers was 1.3 times greater than that contributed by each of the other restaurant workers, while the income made by each Huimin Restaurant worker was equivalent to only 30 percent of that made by each of the other restaurant workers.

The above situation indicates that the implementation of the profit-contract economic responsibility system has played a significant role in reversing the protracted loss of money in the case of some units. But the losses made by some units are operational ones and abnormal because their profit potential is great. Therefore, if a change from loss to profit is the only consideration in assigning contracts, a situation like the case mentioned above is bound to arise. To make such an approach will have an adverse effect on state revenues and dampen the enthusiasm of other enterprises in the same trade.

Since industry, communications, finance, and trade enterprises differ in thousands of ways, introduction of the economic responsibility system must proceed from reality, concrete circumstances, and concrete analysis; and each case must be dealt with on its merits. A problem currently calling for study and solution is how to determine, for units implementing the profit-contract system, a reasonable contract quota in such a way that it will ensure bringing the two kinds of enthusiasm into play, take good care of the interests of three sides, and ensure more revenues for the state, more retained profits for enterprises, and more income for individuals while encouraging the advanced and spurring the backward on. This problem should be given attention by all sides concerned. How are we to work out a reasonable quota to be assigned? I had talks with some comrades whose consensus is: (1) Quotas should be drawn up only after investigation and study and with consideration given to the business conditions of the units concerned, including the actual results of their operation for the previous year; the average figures and progressive growth rates for the past 3 years; their past record levels; and, also, with consideration to the state standards as well as the average advanced levels of the same trade, same type, and same class. Only thus can advanced and reasonable quotas be set, making it possible for enterprises and most of the workers to overfulfill the quota through exertion of efforts. (2) Production and operation are complicated and variable in some enterprises. In such cases, the base contract figures should be concretely figured out and determined separately for different trades and different enterprises in light of current market conditions and objective factors. It should be permissible to make the necessary adjustment through practice. Nothing should be made unalterable. (3) With regard to enterprises and units that lose money, the causes of the losses should be concretely analyzed and corresponding measures should be taken to deal with them rather than just assigning a contract and having done with it. At the early stage, it is difficult to figure out the quota accurately; and, inevitably, some quotas are set too low. The duration of contracts should be a little shorter so that adjustment can be promptly made. Money-losing enterprises should be reorganized promptly and the causes of their losses should be traced and guarded against by taking the necessary measures. In the case of such enterprises, the profit-contract system should be restored only after their normal production and operation have been restored.

'JINGJI GUANLI' DISCUSSES COMMERCIAL NETWORK

HK190805 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 9, 15 Sep 81 pp 47-48, 55

[Article by Ji Jianxin [4764 1696 2450]: "How Did Jiangsu Province Develop its Commercial Network?"]

[Text] (1) The Present Situation of the Commercial Network

There were 226,000 commercial, catering and service points (hereafter referred to as commercial network) in Jiangsu Province in 1957, with an average of 5.4 points for every 1,000 people and such a situation was basically in line with the need to develop the national economy and people's life. People were happy to enjoy convenience in their life and to see brisk markets. But under the influence of various thinking such as "constantly reforming the relations of production," "changing consumer cities to producer cities" and "production first and then people's life," a great number of commercial points were abolished or merged while the shops run by couples, small retailers and mobile pedlars that represented the individual economy were sliced down after 1958. The commercial network further declined during the 10 turbulent years. Compared with 1957, the population increased by 39.4 percent in 1978 and the volume of retail sales of social commodities increased by 257.1 percent; but the commercial network decreased by 67.7 percent, with a decrease of 76 percent per 1,000 people on average. In 1978, the average space for the commercial network in cities was only 400 square meters per 1,000 people, about 50 percent less than the normal space of 700 square meters. Consequently, the broad masses of people found it difficult to solve daily necessities such as eating, living, bathing, having their hair cut, buying vegetables, repairing shoes and making clothes.

In 1978, the provincial authorities decided to improve the situation of the commercial network. With the party secretaries at various levels taking command, the masses were organized for this purpose. But because of wrong policies, just over 1,000 commercial points were set up after 1 year of the work that was carried out in a big way. Taixing Prefecture that planned to set up 29 commercial points only set up 1 point.

Under the inspiration of the 3d plenary session of the 11th party Central Committee in 1980 and following the implementation of the directives of the party Central Committee that in developing a commercial network it is necessary to engage in a more diversified economy, adopt more management forms and more circulation channels and to lessen links (abbreviated as "three mores and one less"), the commercial network has developed rapidly. During the year alone, 47,000 commercial points were set up. The departments concerned of the province are now considering working out a plan for the development of the commercial network in a bid to restore the commercial network to the level of 1957 in 5 years so that it will accord with the needs of people's life in the interests of both production and people's livelihood and to help open up a road for more employment. According to initial calculation, once the commercial network is restored to the 1957 level, it will be able to provide an additional 200,000 to 300,000 jobs and increase the amount of currency withdrawn from circulation by 1 to 2 billion yuan.

(II) Encourage Through Policies the Initiative of Various Aspects in Developing Commercial Network

How to develop the commercial network? To depend on state investments or party policies? Comrades from Jiangsu Province said that it will not work to totally depend on state investments and that the commercial network will be able to develop rapidly only by relying on party policies and principles. Jiangsu Province mainly implemented the following policies.

1. Conscientiously implement the principle of "three mores and one less" and adopt various forms to develop the commercial network.

First, encourage individual households to undertake various trades such as small snack bars, small service points, small repair points and small groceries so as to enable the network of small retailers to spread even wider as a supplement to state commerce. Such retail points are flexible and they are in a position to go deep among the grassroots and the masses for the convenience of their life. Over the past year and more, Wuxi city has set up 150 eating houses. This figure is equivalent to the figure for the eating houses run by the state and the collective. With rational location, these eating houses are able to solve the problem of eating fairly well.

Second, continue to develop collective commerce so as to assist state commerce. This method does not require state investments, nor does it require more people with commodity grain or increase the state labor quotas; but it is in the interest of arranging more employment. The Qionghua neighborhood committee of Yangzhou city has set up 18 small eating houses, small grocers and small repair points without spending a single cent from the state. These undertakings convenience the masses and provide employment for a number of people.

Third, set up shops by making use of the existing premises of industrial and mining enterprises, organizations, army units and schools. In 1980, 668 shops of this kind were set up throughout the province.

Fourth, restore and develop city agricultural trading markets. Since the 3d plenary session of the 11th party Central Committee, the province has restored and developed 245 such markets. The trading volume of vegetables, meat, eggs, poultry and marine products and these markets in 1980 equalled 16 to 36 percent of the trading volume of similar commodities in state markets which made up for the shortages in state markets. At the same time, the emergence of competitors has helped the state enterprises to improve their management.

2. Implement the responsibility system in the existing state-owned shops. The previous method of "eating out of a big pot" characterized by fixed wages and awards was not in the interest of mobilizing the initiative of staff and workers and consequently many shops did not play their due roles. In 1980, the shops in Nanjing city with bad service quality and bad management experimented with the wage form of "assigning responsibility for fixed quotas with retention for overfulfillment." With this form, the units concerned signed contracts with shops to implement "five fixed quotas for shops" (fixed sales volume, fixed gross earning, fixed expenses, fixed profits and fixed proportion of retention from the profits gained from the overfulfillment of the quotas). Thus the method of fixed wages and awards was changed to basic wages plus profit retention for overfulfillment of quotas. Investigations of typical units showed that with this method, all working efficiency, sales volume, gross earnings and tax increased by over 200 percent. For example, the Shengji cigarette and wine cooperative shop in Gulou, Nanjing, had bad management. It refused to sell even the commodities that were in good demand. Its service was bad and when customers came to buy something, the answer was "out of stock" even if it had the goods. As a result, many commodities turned moldy and the shop lost every year. Now great changes have taken place since the shop introduced the responsibility system. Its varieties of commodities have increased from 60 or 70 to more than 100. The staff now treat their customers warmly while their service hours have been prolonged from 7 in the morning till 11 at night. In the first month following the introduction of the responsibility system, the shop turned losses to profits and overfulfilled the sales quotas, gross earnings quotas and tax quotas in each of the following 6 months.

3. Prohibit arbitrary dismantling or occupation of commercial points. Under the influence of the "leftist" thinking in the past, some departments and units arbitrarily dismantled and occupied commercial points at will. The provincial departments concerned consequently defined that no unit is permitted to dismantle or occupy commercial points arbitrarily. If such points are to be dismantled because of municipal construction, it can only be done after the same number of alternative premises are built by those who are doing the dismantling. The points that were occupied earlier for other purposes must in principle be taken back or be exchanged for other premises. Roadside premises that have been occupied must be returned soon so that the shops will be able to operate again.

4. The management of investment in capital construction must accord with the features of the scattered and small-scale commercial network. Basing themselves on the sources of the commercial profit retention, losses and depreciation funds, the provincial departments concerned allotted 4.52 million yuan for the capital construction of the commercial network in 1980 to set up 70,000 square meters of commercial network and solve some urgent problems. But in 1981, there was no investment in this aspect and consequently some urgent problems have yet to be resolved. The provincial commercial departments pointed out that the commercial network is an apparatus directly serving the livelihood of the masses and it includes many commercial points that are spreading widely and each of these points only requires several hundred thousand yuan of investment with a construction space ranging from

several hundred to 1,000 square meters. Such commercial points basically do not consume state energy, nor do they vie for raw materials. Therefore, commercial departments must be allowed to build part of the commercial points with the funds raised by themselves on the premise that such a measure will not affect the state finance. With regard to the management of such investments, consideration should be given to using the expenses for such undertakings together with the construction funds with whole responsibility according to the method of using the funds for constructing simple commercial buildings.

5. The commercial points in the newly built industrial and mining areas and housing areas must be coupled with related infrastructural construction. In the past, the building units only paid attention to the main projects and neglected construction of the related infrastructure such as municipal installations and commercial points. Consequently, many houses could not be commissioned after completion. Such a situation has been improved a little over the past 2 years.

The practice of Jiangsu Province has proved that in developing a commercial network it is imperative to rely on party policies. But it is also necessary to have a certain source of funds for carrying out some capital construction to add more commercial points. It is unlikely at present that we will be able to rely on state investments and we must mainly rely on our own efforts in gradually solving this problem by making use of commercial profit retention and the finance of various levels in the localities. Local finance in particular must undertake fewer "bones" and more "meat." In this way, after 3 to 5 years of hard work it will not be difficult to restore the commercial network to the 1957 level.

(III) Some Problems in Developing Commercial Network

Comrades from Jiangsu Province say that there still exist three problems for them in developing the commercial network.

1. Some comrades still do not dare to implement the principle of "three mores and one less" and particularly in developing individual small retailers. They have "four fears and three worries." That is to say, they fear that they will develop capitalism, carry a burden, squeeze the business of others and affect the urban environment and they worry that their source of goods, license and places for business will be blocked. For example, several months ago, there were 500 pedlars from the countryside who sold dumpling soup in Nanjing city and they were welcomed by the masses. But before long they were driven out on the grounds that they had no license and they were discarding agricultural production. Quite a number of the more than 40,000 commercial points that were developed in 1980 were given no license by the departments concerned. Some comrades who are doing business individually, "eating out through selling the commodities that are in short supply," selling popular goods of dependable quality and who are accustomed to simple service, are not active in supporting the businesses run by many or individual households and such an attitude is not in the interests of developing the commercial network.

2. The commercial departments are now leasing 70 percent of the business premises of the housing department. These houses were left over from preliberation days and they are all very simple and old. For a long period the housing department only collected rent but did not repair the buildings, and with more dangerous

buildings increasing year by year, the use of these buildings has been affected. Comrades from the provincial commercial bureau suggested that during the readjustment period these buildings be handed over to the commercial departments so that these buildings can be repaired to ease the stringent situation of commercial buildings.

3. The funds for tapping potential, renovating and restructuring are only used in production construction while only little consideration is given to meeting the needs in making up for complete "meat" such as commercial points, cultural, educational and health installations and municipal installations. If this situation continues, a new imbalance will occur in the proportion between the "bones" and the "meat."

GENERAL

DEVELOPMENT OF COMMERCIAL SERVICES SAID NECESSARY

Kunming YUNNAN RIBAO in Chinese 19 Sep 81 p 3

[Article by Shu Qun [2885 5028]: "Development of Commercial Services Is the Inexorable Trend of Economic Development"]

[Text] Commercial services are a link indispensable to the total process of social production, playing an important functional role in organizing circulation, joining production and consumption, linking up industry and agriculture, promoting production development, and serving people's livelihood and directly bearing on the ultimate realization of the aim of socialist production.

As we know, the process of social reproduction is unity of the production process and the circulation process. Production and circulation depend on each other, interace on each other, and condition each other; and neither should be overemphasized at the expense of the other. Production is the decisive link and, without production, circulation will lose its material base; but, without circulation, production and consumption of products cannot be realized and, no matter how many products are turned out, they can only lie in the warehouse and cannot pass from the hand of the producer to the hand of the consumer, in which case the potential use-value of products cannot be translated into use-value and it is similarly impossible to satisfy the needs of the people. Only through the bridge of circulation can production and consumption be linked up and the aim of production be ultimately achieved. Therefore, circulation must be suited to production and commercial services must be corresponding developed. Along with the progress of science and technology, the growth of industrial and agricultural productivity, the rise in people's living standard and the change in consumer structure, commercial services will be ever expanded in scope and commerical employees will ever increase in number: such is the inexorable trend of modern economic development.

Development of commercial services is an important feature of the economic readjustment and is a long-term plan for promoting production, bringing about a prosperous economy, benefiting the nation and serving the interests of the people. Over the years, influenced by the "leftist" ideology, people have had certain prejudices against commercial labor and have gone so far as to equate commodity exchange with capitalism. In economic construction, they often laid stress on production to the neglect of consumption, on production to the neglect of circulation, on production to the neglect of services, and on industry to the neglect of commerce with the result that development of commercial services has fallen behind the development of production and the needs of people's livelihood. Population has increased, the housing area has expanded, and people's purchasing power and commodity circulation have increased fast but commercial networks have decreased. In the Kunming municipality, for example, commercial networks have decreased 50 percent in 1978 compared with 1956, causing great inconveniences to people's livelihood. Since the Third Plenum of the Party, the party and government who care for the living condition of the people have made great efforts and commercial services have been significantly restored and developed, and shortage of commercial services has eased. But, for multiple reasons, the development of commerical services is still a long way from the production and livelihood requirements of urban and rural people; and some trades have not been restored to their record levels of the past and such problems as finding it difficult to have a dress made, to get meals in a restaurant, to have things repaired, and to get bus service have not been completely solved. Further, it should be pointed out that, with the implementation of the line and policies laid down at the Third Plenum, the national economy has embarked upon the correct road to sound growth; agriculture and light industry have markedly developed; consumer goods have increased in large quantities; the variety of colors and designs is increasing day-by-day; farm produce and by-products are continuously flowing into the market; and, along with these developments, people's economic income and purchasing power have increased. These circumstances set new and higher demands on commercial services. When commodities increase in variety and quantity, it is necessary to expand the networks to increase sales. When cloth and silk products are abundant, it is necessary to increase dressmaking correspondingly. When meat, fish, poultry, and eggs are abundant, it is necessary to strengthen the catering services to make delicious food for the people. When the urban and rural people have bought more bicycles, watches, sewing machines, and TV sets, the repair trades should correspondingly increase. Therefore, along with the development of the national economy, commerce must keep pace, the circulation channels should be kept more open, and services should be further augmented and perfected so as to give a greater impetus to production, withdraw money from circulation, stimulate the economy, make the market prosper, and meet the living requirements of urban and rural people.

Developing commercial services also is an important avenue for the placement of youths waiting for employment and for solving the problems of unemployment. Labor employment is a pressing problem in the economic development of our country. Because of the limitations of state financial resources and the adjustment of the economic structure, it is not possible to solve the problem of unemployment within a short period of time by building new plants. By developing commercial services, arrangements can be made for the placement of large numbers of unemployed persons in cities. Most of the commercial services fall into the category of labor-intensive trades characterized by less investment, quicker results, greater returns, and a capacity for accommodating more manpower. According to surveys, the manpower accommodated by each 100 yuan in fixed assets in the industrial sector is less than one able-bodied worker in the case of heavy industry and only two-and-one-half able-bodied workers in the case of light industry. But, for the placement of one able-bodied worker, the amount of investment required is about some 800 yuan in the case of the state-operated catering trade, some 600 yuan in the case of the clothing trade, and only some 100 yuan in the case of a barber shop. In a situation in which our country lacks construction funds but has surplus manpower, the development of commercial services and diverse kinds of public service businesses will open a broad avenue for employment. Again, take the Kunming municipality for example. According to the requirement of commerical employees who account for only 3 percent of the national average, the municipality can create an additional 20,000 jobs. Thus, commercial services still have great employment potential.

To be sure, the development of commercial services should proceed from the reality of various localities, from the needs of the masses, and on the basis of proper arrangement and deployment. For the present, it is particularly advisable to develop small-scale collective commercial services and individual commercial service trades so that a diversified economy, in which different sectors exist side-by-side, with the state and collective economy as the mainbody and the individual economy as the subsidiary, and a unified socialist market with diversified modes of operation and diversified channels of circultation will form a commercial service structure which has multiple levels and whose network and centers are more properly and flexibly distributed and more suited to the needs of the masses, a commercial service structure which will play a still greater part in the four modernizations.

WORKER REPRESENTATIVE SYSTEM AT SHAANXI PLANT DESCRIBED

Xian SHAANXI RIBAO in Chinese 27 Aug 81 p 1

[Article by reporter Shen Yunjun [3088 0061 7486]: "The Key To Handling Democratic Management of Enterprises well Is the Party Committee--Investigation of the Implementation of the Worker Representatives Conference at the Shaanxi Textile Equipment Plant"]

[Text] The party committee of the Shaanxi textile equipment plant handed over the big task of business administration to the worker representatives conference for discussion and decisions, actively mobilized the enthusiasm of the broad number of workers for being masters, and thus improved and strengthened party leadership. From 1978 to 1980, overall the plant overfulfilled the state production tasks for 3 consecutive years. During the first 7 months of this year, it completed 81.11 percent of the total production value for the whole year and realized 113.08 percent of the planned profits for the entire year.

When this plant began to reinstitute the worker representatives conference in 1978, some leading members of the party committee feared that developing democracy would result in misuse; they feared too many opinions would make it difficult to reach final decisions; and they said: "Our plant is a one with serious problems, there are many debts, holding worker representatives meetings will intensify the conflict between the leaders and the workers." To unify understanding, the party committee immediately organized a "group" to study the directives of the party Central Committee concerning democratic management of enterprises, reviewed the facts during the first half of 1977 when the plant humbly listened to the opinions of the masses, mobilized the masses to engage in a hundred days of labor competition, and quickly changed the chaotic situation at the plant and turned losses around so that everyone recognized that the workers of a socialist enterprise are the masters of the nation, the worker representatives conference is the fundamental form for the implementation of democratic management. It provides organizational assurance for developing the workers' sense of responsibility as the master and the enthusiasm to be the master; it not only will not intensify the conflict between the leaders and the workers, it will strengthen and improve the party's leadership and promote the development of the enterprise. At the beginning of 1978, the percentage of qualified products of seven types of production of the plant was very low; half of the products were not up to standard. Through the holding of the worker representatives conference, the representatives conscientiously analyzed the favorable conditions and the unfavorable factors in production at the plant, proposed 229 measures, and adopted corresponding decisions. After the conference, the plant leadership and the workers of the whole plant conscientiously implemented the conference resolutions and concentrated on the weak links involved in improving product quality, and by September the quality of all products was up to standard.

Let the Worker Representatives Conference Have Authority and Duty

After establishing the worker representatives conference in the plant, the party committee gave it full authority:
1. to discuss and decide on the reform of business management of the enterprise and establish rules and regulations and systems; 2 to discuss and decide on plans for the development of the enterprise, annual plans, and plans for digging for potential, reformation and improvement; 3 to review the financial budget of the whole plant, the final accounts, and the utilization of capital at the enterprise; 4 to resolve the major questions concerning collective welfare enterprises for the workers and concerning the individual benefits of the workers; 5 to supervise and evaluate the work of the leading cadres at each level.

The party committee of this plant not only handed the authority over to the worker representatives conference; it also respected the resolutions and measures decided on by the worker representatives conference in exercising its authority. It assured implementation of the resolutions of the worker representatives conference as the practical activity to organize and support democratic management at each level. For 3 years, the group organized by the party committee and the leading cadres at each level carried out the work and led in the implementation of the resolutions. In May of last year, the plant held its second worker representatives conference. The representatives inspected waste, dug for potential, calculated the detailed accounts, and resolved to realize a profit of 1.5 million yuan for the whole year. Although in September there was a shortage in the supply of raw materials, the plant manager personally went to the mountain regions to secure materials so that the resolution of the worker representatives conference did not become empty talk. Last year, the whole year's profits reached 1.53 million yuan. After each worker representatives conference of the plant, each branch of the party conscientiously transmitted the spirit of the conference and propagandized the resolutions, mobilized the masses to establish plans and measures to realize the resolutions so that everyone cared about and conscientiously implemented the resolutions. The party directly examined the execution of the conference resolutions and also tasked the union organization and the worker representatives conference representative with carrying out inspections. Before inspection, they first determined the key points of inspection according to the content of the resolution, then they reported the inspection results to the party committee or wrote a synopsis and posted it throughout the plant.

Party Leadership Is Strengthened and Improved

After this plant established the worker representatives conference system, the party leadership was not weakened but was improved and strengthened. First, the party committee's main efforts could be devoted to grasping the major political guidelines and ideological and political work of the party. Previously, the party committee had to decide on everything at the plant. Since the worker representatives conference system was instituted, there has been a change: the party committee has been able to arrange, inspect and establish systems for ideological and political work. When combining and popularizing the responsibility system of linking output with remuneration, the party committee profoundly launched the campaign for the "five stresses" and "four points of beauty," forcefully promoting the development of production. Second, the conference system brought the relationship between the party and the masses close. This plant's production scale was large, the number of workers increased, they were hard pressed, and so the masses complained. After instituting the worker representatives conference, before each conference, the delegates widely sought the opinions and demand of the workers; the conference decided which were urgent matters and which were not, and according to the plant's financial ability, the tasks that the plant wanted accomplished were written into resolutions and then the concerned departments completed the tasks within a definite period. Tasks that were not completed because the conditions were unsuitable were explained to the workers so that everyone was satisfied, and the relationship between the party and the masses became closer. Third, the conference system benefited the implementation of the party's guidelines and policies. For example, the workers requested that last year's surplus rewards be distributed. This obviously did not coincide with the state regulations. At the third session of the second worker representatives conference, the plant leaders explained to the representatives the policy and the reason for preallocation of a protion of the reward money. The conference discussed the matter and decided to preallocate the reward money. The workers knew about the decision of the worker representatives conference and did not have any further complaints. Fourth, the conference system promoted a change in the way of thinking of the teams of cadres. Since the institution of the worker representatives conference, the improper methods of handling personnel shifts, recruitment of workers and housing appropriations, and similar behind-the-scenes activities have been eliminated. Some cadres said: we are not afraid that the worker representatives represent us, we are afraid that they use facts to carry out inquiries.

This plant has achieved welcome results in implementing the worker representatives conference system. But the representatives consider that is not perfect enough, and at present they are summarizing and improving the experience according to "the temporary regulations concerning the worker representatives conference of state-run industries and enterprises."

HEBEI TO BUILD PORT EAST OF CANGZHOU

HK061200 Hong Kong TA KUNG PAO in Chinese 6 Nov 81 p 1

[Dispatch from correspondent Huang Ke-fu [7806 0344 1133] from Guangzhou: "Hebei Decides to Draw in $100 Million in Foreign Investment to Build a Port East of Cangzhou"]

[Text] In an interview with our correspondent today, Li Erzhong, governor of Hebei Province, said, "Hebei Province is rich in natural resources. It has convenient land and water communication systems and good port facilities. Foreign merchants, overseas Chinese, and industrialists from Hong Kong and Macao are welcome to invest, or to develop compensation trade and processing and assembling of imported materials. We are now drawing up plans for the construction of a port east of Cangzhou. We plan to draw in $100 million in foreign funds for the cost of the construction and are prepared to export 3 million tons of raw coal to pay for the loan. Hebei Province is very rich in coal as well as in molybdenum and other rare metals.

"Hebei Province has a good industrial foundation. There is considerable potential for the processing and assembling of industrial machinery, and an abundant supply of scientific and technical forces and work forces. Industrialists from overseas are welcome to Hebei Province for tours, visits, investments, setting up factories, opening up mines or engaging in partnerships. We will give preferential treatment."

When talking of his visit to the special economic area of Shenzhen, he said Shenzhen had a lot of experience which Hebei Province could use as a reference in developing its economy. He said: "For example, Hebei Province could follow the example of the tourist and holiday center in both big Meisha and small Meisha. Qinghuangdao and Beidaihe in Hebei are excellent resorts. Hebei Province also has a lot of scenic spots and historical sites admired by tourists at home and abroad. For example, people look forward to the summer mountain villa of Chengde. Hebei Province will strive to repair and protect historical relics and sites, build scenic spots and develop the tourist trade."

Governor Li Erzhong arrived in Guangdong last week at the head of a Hebei provincial delegation consisting of responsible members of the departments concerned. They visited the special economic area to see its construction and to learn from its experience. After a 2-day visit to Shengzhen, they returned to the north by plane this afternoon. Just before leaving Guangzhou, Governor Li Erzhong met with our correspondent in the guest house.

SELECTED ECONOMIC STATISTICAL DATA FOR 1949-1979

STATE STATISTICAL BUREAU

EXPLANATIONS

1. These data have been supplied by the State Statistical Bureau. Some of the figures published in the past have been checked and revised. Some of the indexes have been changed because of changes in the computing units or statistical limits.

2. These data, with the exception of our national territory, do not contain Taiwan provincial figures.

3. To facilitate numerical comparison for various periods, all of the figures of units owned by the whole people and those owned collectively that have been tabulated for 1949-1957 include pertinent data for that period on joint state-private enterprises, private enterprises, and handicraft industrial units.

4. The average annual rate of increase of all data tabulated is calculated according to the standard method [shuiping fa].

Population and Natural Resources

Item	Actual Fig end-1979
National population	97,092 (Unit of 10,000 people)
of which:	
Population in cities, towns	12,862 " " "
Population in rural areas	84,230 " " "
Social laborers	40,580 " " "
of which:	
Agricultural laborers	29,934 " " "
Industrial laborers	5,340 " " "
Area of state	About 960 (in 10,000 km^2)
Cultivated area	9,950 (Unit of 10,000 ha)
Plain	5,473 " " "
Hilly land	4,477 " " "
of which: Level terraced field	800 " " "
Area of land used for forestry	25,509 " " "
of which:	
Forest area	11,978 " " "
Sparsely wooded area	1,563 " " "
Underbrush area	2,957 " " "
Immature forest, seedbed	472 " " "
Rate of forest mulch	12.5%
Total forest reserves	93.5 (hundred million m^3)
Grassland area	31,908 (10,000 ha)
Total area of fresh water	1,664 " "
Waterpower reserves	6.76 (hundred million kw)
Length of inland rivers	43 (10,000 km)
Area of ocean fishing grounds	81.8 (10,000 sq. nautical li (haili))
Length of coastline	18,000 (+10,000 km)

Note:

1. With the exception of the area of our state, these data do not include figures of Taiwan Province.
2. The cultivated area appears to be decreasing. Further investigation and checking are to be done.
3. The figures for forest area and total forest reserves have been checked for 1973-1976 and that for water surface area, in 1974.
4. The length of coastlines does not include that of islands.

National Population Figures

Unit: 10,000 persons

Year	Total population (year-end fig)	By sex Male	Female	By cities, countryside Population of cities/towns	Population of rural areas
1949	54,167			5,765	48,402
1952	57,482			7,163	50,319
1957	64,653	33,469	31,184	9,949	54,704
1965	72,538	37,128	35,410	10,170	62,368
1975	91,970	47,126	44,844	11,171	80,799
1979	97,092	49,754	47,338	12,862	84,230

Note: This table does not include the number of compatriots in Taiwan, Hong Kong, and Macao.

Major Indexes of National Economy
(Absolute Figures)

Item	Unit	1949	1952	1957	1965	1975	1979
1. National population figure	10,000 persons	54,167	57,482	64,653	72,538	91,970	97,092
2. Social laborers	"		20,729	23,771	28,670	38,168	40,581
Of which: staff, workers	"		1,603	3,101	4,965		9,967
3. Gross value of industrial, agricultural output	hundred million yuan	466	827	1,241	1,984	4,504	6,175

Note:

1. The gross values of industrial and agricultural output for 1949 and 1952 of this table are calculated on the basis of the fixed prices of 1952; that of 1957 and 1965, on 1957 prices; that of 1975 and 1979, on 1970 prices. The remaining indexes of amount of money are all calculated on the prices in those years.
2. Net output value of national income from five sectors: agriculture, industry, construction, communications and transportation, and commerce.
3. Figures marked with "*" are those of 1950 (same as the next table).
4. The total volume of retail sales of social commodities includes the retail sales of peasants to non-agricultural residents.

Major Indexes of National Economy
(Indexes and Averages/Rate of Increase)

	Indexes (taking 1952 as 100)			% of average annual increase	
Item	1957	1965	1979	1953–1979	1950–1979
1. National population figure	112.5	126.2	168.9	2.0	2.0
2. Social laborers	114.7	138.3	195.8	2.5	
Of which: staff, workers	193.5	309.7	621.8	7.0

Wristwatches	ea			1.1	2,762	46,767
Television	ea				12	3,641
Sugar	ton	548	1,233	3,356	4,000	6,849
Machine-made paper, cardboard	ton	301	1,014	2,493	4,740	13,507
2. Railway transport						
Turnover of goods	100 mil ton/km	0.50	1.65	3.69	7.39	15.31
Turnover of passengers	100 mil passenger/km	0.36	0.55	0.99	1.31	3.33
3. Area of residential construction	10,000 m^2			7.72	4.73	17.14
4. Total social commodity turnover	10,000 yuan	3,849	7,584	12,992	18,364	49,315
5. No. of books published	10,000 vol	28.8	215.3	349.4	594.9	1,115.6
Magazines	10,000 vol	5.5	56.0	86.3	120.7	324.3
Newspapers	10,000 units	112.9	440.8	669.2	1,298.9	3,584.2

Population Birthrates, Mortality, and Rate of Natural Increases

%

Year	National			Municipal			County		
	Birth-rate	Mor-tality	Rate of natural increase	Birth-rate	Mor-tality	Rate of natural increase	Birth-rate	Mor-tality	Rate of natural increase
1949	36.0	20.0	16.0						
1952	37.0	17.0	20.0						
1957	34.0	10.8	23.2	44.5	8.5	36.0	32.8	11.1	21.7
1965	38.1	9.6	28.5	27.6	5.9	21.7	39.5	10.0	29.5
1975	23.1	7.3	15.8	15.2	5.6	9.6	24.2	7.6	16.6
1979	17.9	6.2	11.7	13.9	5.1	8.8	18.5	6.4	12.1

Note: This table is calculated on the basis of annual average population.

Number of Social Laborers (Year-end)

Unit: 10,000 people

Year	Social laborers		No. of workers in collectives of whole people and cities, towns	Individual laborers in cities, towns	Laborers of people's communes in rural areas
	Total	% of total population			
1952	20,729	36.1	1,603	883	18,243
1957	23,771	36.8	3,101	104	20,566
1965	28,670	39.5	4,965	171	23,534
1975	38,168	41.5	8,198	24	29,946
1979	40,581	41.8	9,967	32	30,582

Number of Workers of Various Departments of Ownership System of the Whole People (Year-end)

Unit: 10,000 people

Items	1952	1957	1965	1975	1979
Total	1,580	2,451	3,738	6,426	7,693
Industry	510.0	748.0	1,238.0	2,691.0	3,109.0
Construction industry	104.8	271.4	383.0	558.5	671.2
Agriculture, forestry, water conservancy, meteorology	23.9	112.3	422.0	723.3	810.4
Transportation, post & telecommunications	112.9	166.5	245.0	399.5	463.9
Trade, food & service industries	292.3	488.7	550.0	829.5	1,027.8
Science, culture/education & health	239.2	327.3	533.0	755.1	998.1
Urban public utilities	4.1	21.8	44.0	74.7	110.9
Finance	34.4	36.2	36.0	36.6	50.4
Official organizations	258.5	278.9	287.0	357.6	451.0

Total Workers' Wages of Various Departments Under Ownership of the Whole People

Unit: hundred million yuan

Items	1952	1957	1965	1975	1979
Total	68	156	235	386	529
Industry	24.6	50.7	86.4	169.1	230.2
Construction industry	5.9	21.7	24.9	39.0	54.2
Agriculture, forestry, water conservancy and meteorology	0.9	5.4	18.1	32.8	44.5
Transportation, post & telecommunications	6.2	12.4	18.8	27.0	37.0
Trade, food, service industries	9.5	26.5	31.3	46.3	63.5
Science, culture/education & health	9.2	18.3	31.1	42.1	59.9
Urban public utilities	0.3	1.4	3.1	4.7	7.3
Finance	1.4	2.2	2.3	2.3	3.1
Official organizations	9.5	17.8	19.3	22.8	29.7

Total Number and Wages of Workers of Collectively Owned Enterprises in Cities and Towns

Items	1965	1978	1978	1979
1. No. at year-end (10,000 persons)	1,226.6	1,916.4	2,048.0	2,273.5
Industry	505.4	1,142.0	1,215.0	1,327.7
Construction industry	93.5	157.0	174.5	219.1
Agriculture, forestry, animal husbandry, by-products, fishery	72.3	51.4	59.2	51.6
Transport industry	172.6	188.9	204.3	218.6
Trade, food, service industries	200.3	203.1	211.3	259.4
Culture, education, health	117.8	123.0	128.4	132.9
Administrative departments	6.3	14.0	14.2	17.0
Others	58.4	37.0	41.1	47.2
2. Total wages (100 million yuan)		89.0	100.2	117.2

Origin Value of Fixed Assets of Enterprises Owned by the Whole People at End of Year

Unit: 100 million yuan

Items	1952	1957	1965	1975	1979
Total	240.6	522.9	1,445.8	3,414.3	4,892.5
Of which:					
Industry	107.2	272.2	961.0	2,290.3	3,253.2
Agriculture				90.8	146.8
Construction industry	1.7	21.7	22.9	47.5	80.4
Transportation, posts and telecommunications	115.2	182.7	337.9	672.0	890.2
Trade, food, service industries	11.5	33.9	91.1	209.6	358.7
Supply/sales of goods	0.1	1.8	8.8	23.9	41.6
Urban public utilities	4.9	10.6	24.1	37.6	59.1
Science, culture, education, health				17.0	25.9

Note: 1. Original value of fixed assets refers to purchases of independent accounting enterprises as well as amount of payment for various fixed assets by the construction (industry) and additional investments for rebuilding and expansion.

2. This table is divided according to administrative channels, not to economic departments. The same is for the following table.

Proportion of Circulating Fund Quota Used by Enterprises Owned by the Whole People at End of the Year

Unit: 100 million yuan

Items	1952	1957	1965	1975	1979
Total	171.7	401.8	915.9	2,298.6	3,087.5
Of which:					
Industry	33.0	62.9	230.4	770.8	1,026.5
Agriculture				47.0	129.8
Construction industry	3.7	19.5	18.0	30.8	41.0
Transportation, post and telecommunications	7.1	9.5	20.7	61.9	75.8
Trade, food, service industry	123.2	290.1	493.4	1,061.0	1,421.5
Supply, sales of goods	4.3	19.4	152.3	299.3	354.3
Urban public utilities	0.4	0.4	1.1	3.4	5.1

National Income, Consumption, and Accumulation

Items	Unit	1952	1957	1965	1975	1979
National income	100 million yuan	589	908	1,387	2,503	3,350
Index (taking 1952 as 100)	%	100	153.0	197.5	384.7	484.9
According to average national income of population	yuan/person	104	142	194	274	347
Quota for use of national income	100 million yuan	607	935	1,347	2,451	3,356
Consumption quota	100 million yuan	477	702	982	1,621	2,195
Accumulation quota	100 million yuan	130	233	365	830	1,161
Rate of accumulation	%	21.4	24.9	27.1	33.9	34.6

Note: In addition to calculating the national income according to fixed prices, the remainder of this table is computed on the basis of prices at that time. The "shiyong e" [utilization quota] of the national income is not equal to the total national income, but is influenced by statistical errors as well as import-export balances.

Development of Rural People's Communes

Year	Number of rural people's communes (1)	Number of brigades (10,000)	Number of production teams (10,000)	Number of households in communes (10,000)	Commune members (10,000)	Average number of brigades in a commune (1)	Average number of production teams in a brigade (1)	Average number of people in a production team (1)
1958	23,630			12,861	56,017			
1965	74,755	64.8	541.2	13,527	59,112	8.7	8.3	109
1975	52,615	67.7	482.6	16,448	77,712	12.9	7.1	161
1979	53,348	69.9	515.4	17,491	80,739	13.1	7.4	157

Cultivated Land

Year	Total amount of cultivated land (10,000 Ha)	Cultivated land of which		Proportion of cultivated land of which (%)	
		Paddy fields (10,000 hectares)	Irrigated land (10,000 hectares)	Paddy fields	Irrigated land
1949	9,788	2,282	323	23.3	3.3
1952	10,792	2,585	489	24.0	4.5
1957	11,183	2,753	1,068	24.6	9.6
1965	10,359	2,496	1,011	24.1	9.8
1975	9,971	2,553	2,068	25.6	20.7
1979	9,950	2,542	2,230	25.5	22.4

Note: The amount of cultivated land appears to be decreasing. Further verification remains to be done.

Index of Total Agricultural Output

Year	Taking the year 1952 as 100	Taking the previous year as 100	Year	Taking the year 1952 as 100	Taking the previous year as 100
1949	67.3	-	1965	137.1	108.3
1950	79.2	117.8	1966	148.9	108.6
1951	86.6	109.4	1967	151.3	101.6
1952	100	115.2	1968	147.5	97.5
1953	103.1	103.1	1969	149.2	101.1
1954	106.6	103.4	1970	166.4	111.5
1955	114.8	107.6	1971	171.4	103.1
1956	120.4	105.0	1972	171.1	99.8
1957	124.8	103.6	1973	185.5	108.4
1958	127.8	102.4	1974	193.2	104.2
1959	110.4	86.4	1975	202.1	104.6
1960	96.4	87.4	1976	207.1	102.5
1961	94.0	97.6	1977	210.6	101.7
1962	100.0	106.2	1978	229.6	109.0
1963	111.6	111.6	1979	249.4	108.6
1964	126.7	113.5			

Note: The Gross Value of Agricultural Output is in fixed prices. There have already been three changes. Therefore, the index is calculated on the basis of comparable prices. By using the above index the annual growth rate of agricultural output can be calculated.

Value of Output of Agriculture, Forestry, Animal Husbandry, Sideline Production and Fisheries

Year	Agriculture	Forestry	Animal husbandry	Sideline production		Fisheries
				Total	Of which: Commune-run industry	
1. Absolute figure (100 million yuan)						
1949	224.3	1.6	33.7	11.6		0.6
1952	346.6	2.9	47.9	18.3		1.3
1957	432.6	9.3	69.0	22.9		2.9
1965	446.8	12.0	82.7	38.0		10.1
1975	932.4	37.1	179.4	117.0	82.6	19.1
1979	1,059.6	45.0	221.2	238.9	198.0	19.6
2. % of GVAO						
1949	82.5	0.6	12.4	4.3		0.2
1952	83.1	0.7	11.5	4.4		0.3
1957	80.6	1.7	12.9	4.3		0.5
1965	75.8	2.0	14.0	6.5		1.7
1975	72.5	2.9	14.0	9.1	6.4	1.5
1979	66.9	2.8	14.0	15.1	12.5	1.2

Output of Major Agricultural, Aquatic and Forestry Products

Unit: 10,000 tons

Product	1949 [?]	1952	1957	1965	1975	1979
Grain*	11,320	16,390	19,505	19,455	28,450	33,212
Cotton	44.5	130.4	164.0	209.8	238.1	220.7
Oil	256.4	419.3	419.6	362.6	452.1	643.5
Of which: peanuts	126.8	231.6	257.1	192.8	227.1	282.2
rapeseed	73.4	93.2	88.8	108.9	153.6	240.2
sesame	32.6	48.1	31.3	25.6	20.8	41.7
Jute and hemp	3.7	30.6	30.1	27.9	70.0	108.9

Index of Output of Agricultural, Aquatic and Forestry Products

(Taking the Year 1952 as 100) (%)

Product	1957	1965	1975	1979
Grain	119.0	118.7	173.6	202.6
Cotton	125.8	160.9	182.6	169.2
Oil	100.1	86.5	107.8	153.5
Of which: peanuts	111.0	83.2	98.1	121.8
rapeseed	95.3	116.8	164.8	257.7
sesame	65.1	53.2	43.2	86.7
Jute and hemp	98.4	91.2	228.8	355.9
Silkworm cocoons (mulberry)	109.7	108.1	246.8	343.5
Tussah silkworm cocoons	73.8	63.9	68.9	93.4
Tea leaves	134.9	121.7	254.2	333.7
Sugarcane	146.1	188.2	234.2	302.2
Sugarbeets	313.4	414.4	517.1	648.4
Flue-cured tobacco	115.3	167.6	315.8	363.1
Fruit	133.0	132.6	220.3	287.1
Aquatic products	186.8	178.4	264.1	258.1
From the sea	183.0	189.6	316.0	300.9
From fresh water	193.4	159.0	173.8	183.6
Forestry products				
Tung oil seeds	119.1		85.1	74.7
Tea oil seeds	198.4	133.3	170.7	247.8

Number of Hogs, Sheep and Goats and Meat Production

Year	Number of fat hogs removed from inventory (10,000 head)	Number of hogs in inventory at year-end (10,000 head)	Output of pork, beef, mutton and goat meat (10,000 tons)	Number of sheep and goats in inventory at year's end (10,000 head)		
				Total	Goats	Sheep
			I. Absolute Number			
1952	6,545	8,977	338.5	6,178	2,490	3,688
1957	7,131	14,590	398.5	9,858	4,515	5,343
1965	12,167	16,693	551.0	13,903	6,077	7,826
1975	16,230	28,117	797.0	16,337	6,804	9,533
1979	18,768	31,971	1,062.4	18,314	8,057	10,257
	II. Index		(Taking the year 1952 as 100)			
1957	109.0	162.5	117.7	159.6	181.3	144.9
1965	185.9	186.0	162.8	225.0	244.1	212.2
1975	248.0	313.2	235.5	264.4	273.3	258.5
1979	286.8	356.1	313.9	296.4	323.6	278.1

Note: The number of fat hogs removed from inventory includes those procured by the state, and those slaughtered by the collective and commune members as well as those slaughtered by state farms and other units.

Average Yields Per Hectare for Major Agricultural Crops
(Calculated according to sown area)

Kilo/hectare

Product		1949	1952	1957	1965	1975	1979
Grain		1,030	1,322	1,460	1,626	2,350	2,785
Of which:	Paddy [rice]	1,892	2,411	2,692	2,942	3,514	4,244
	Wheat	642	732	858	1,021	1,638	2,137
	Corn		1,341	1,435	1,510	2,539	2,983
	Soybeans	612	815	788	715	1,034	1,029
	Potatoes	1,405	1,879	2,090	1,776	2,604	2,599
Cotton		161	234	284	420	480	489
Peanuts		1,014	1,287	1,012	1,042	1,208	1,363
Rapeseed		486	501	384	598	665	870
Sesame		394	455	332	386	390	495
Jute and hemp		1,276	1,937	2,105	2,469	2,357	3,008
Sugarcane		24,463	38,885	38,925	38,154	31,868	42,008
Sugarbeet		11,938	13,686	9,440	11,608	8,175	9,557
Flue-cured tobacco		705	1,194	721	1,145	1,524	1,583

Average Amount of Grain, Cotton, Oil, Pork and Aquatic Products Per Person

Year	Grain (Kilo/person)	Cotton (Kilo/person)	[Edible] oil (Kilo/person)	Fat Hogs (head/person)	Pork, beef, mutton and goat meat (Kilo/person)	Aquatic products (Kilo/person)
1949	209	0.82	4.73			0.9
1952	288	2.29	7.38	0.12	5.95	2.9
1957	306	2.57	6.58	0.11	6.25	4.9
1965	272	2.93	5.07	0.17	7.70	4.2
1975	312	2.61	4.96	0.18	8.74	4.8
1979	344	2.29	6.67	0.21	11.0	4.5

Number of Large Domestic Animals

Year	Large domestic animals						
	Total	Of which: Draft animals	Cattle	Horses	Donkeys	Mules	Camels
I. Absolute number (10,000 head)							
1949	6,002		4,393.6	487.5	949.4	147.1	24.7
1952	7,646	5,142	5,660.0	613.0	1,180.6	163.7	28.5
1957	8,382	5,368	6,361.2	730.2	1,086.4	167.9	36.5
1965	8,421	4,322	6,695.1	792.1	743.8	144.7	44.8
1975	9,686	5,122	7,354.7	1,129.9	812.7	335.4	53.5
1979	9,459	5,029	7,134.6	1,114.5	747.3	402.3	60.4
II. Index (taking the year 1952 as 100)							
1957	109.6	104.4	112.4	119.1	92.0	102.6	128.1
1965	110.1	84.1	118.3	129.2	63.0	88.4	157.2
1975	126.7	99.6	129.9	184.3	68.8	204.9	187.7
1979	123.7	97.8	126.1	181.8	63.3	245.8	211.9

Amount of Major Farm Machinery Owned at Year's End

Product	Unit	1952	1957	1965	1975	1979
Total motive power of farm machinery	10,000 horsepower	25	165	1,494	10,168	18,191
Large and medium tractors	Multipurpose [hunhe 3236 0678] tractor	1,307	14,674	72,599	344,518	666,823
Hand-guided tractors	10,000 tractors			0.4	59.9	167.1
Large and medium-sized machine-drawn implements	10,000 units			25.8	90.8	131.3
Combine harvesters	1 unit	284	1,789	6,704	12,551	23,026
Power-driven thresher	10,000 units			11.4	155.3	232.8
Powered irrigation and drainage machinery	10,000 horsepower	12.8	56.4	907.4	4,866.6	7,122.1
Rice mill, flour-milling machine	10,000 units				217.7	291.2
Cotton gin	10,000 units				30.2	26.7
Oil press	10,000 units				16.7	21.6
Trucks	1 unit		4,084	11,063	39,585	97,105
Animal-drawn, rubber-tired carts	10,000 units			133.5	245.4	247.7
Hand-drawn, rubber-tired carts	10,000 units			875.7	2,361.1	3,262.4
Motor-driven fishing boats	10,000 horsepower		10.3	64.0	213.6	312.9

Level of Agricultural Mechanization

Item	Unit	1952	1957	1965	1975	1979
Area actually tractor-plowed in that year	10,000 hectares	13.6	263.6	1,557.9	3,320.3	4,221.9
Tractor-plowed area of [total] plowed area	%	0.1	2.4	15.0	33.3	42.4
Irrigated area	10,000 hectares	1,995.9	2,733.9	3,305.5	4,328.4	4,500.3
Irrigated area of [total] cultivated area	%	18.5	24.4	31.9	43.4	45.2
Area irrigated by electric machinery	10,000 hectares	31.7	120.2	809.3	2,288.9	2,532.1
Area irrigated by electric machinery of [total] irrigated area	%	1.6	4.4	24.5	52.9	56.3
Quantity of chemical fertilizer applied	10,000 tons	7.8	37.3	194.2	536.9	1,086.3
Chemical fertilizer applied per hectare of cultivated land	Kilo	0.7	3.3	18.7	53.8	109.2
Rural small hydroelectric stations	1 unit	98	544		68,158	83,224
Capacity to generate electricity	10,000 KW	0.8	2.0		144.4	276.3
Amount of electricity used in rural areas	100 million KWH	0.5	1.4	37.1	183.1	282.7
Amount of electricity used per hectare of cultivated land	KWH		1.3	35.8	183.6	284.1

Note: 1. Chemical fertilizer is calculated on the basis of containing 100 percent of nitrogen, phosphorous and potassium.

2. The amount of electricity used in rural areas refers to that used for production in the rural communes and brigades and for daily life. It does not include that used by the people's-owned manufacturing units in the rural areas.

Gross Value of Industrial Output and Indexes for Light, Heavy Industrial Values

	With 1952 as 100			With last year as 100		
Year	GVIO	Light industry	Heavy industry	GVIO	Light industry	Heavy industry
1949	40.8	46.6	30.3			
1950	55.7	60.6	46.7	136.4	130.1	154.1
1951	77.0	81.0	69.7	138.2	133.6	149.1
1952	100	100	100	129.9	123.5	143.5
1953	130.3	126.7	136.9	130.3	126.7	136.9
1954	151.6	144.8	163.9	116.3	114.3	119.8
1955	160.1	144.8	187.7	105.6	100.0	114.5
1956	204.9	173.3	262.3	128.1	119.7	139.7
1957	228.6	183.2	310.7	111.5	105.7	118.4
1958	353.8	245.0	555.5	154.8	133.7	178.8
1959	481.8	299.0	822.7	136.1	122.0	148.1
1960	535.7	269.5	10.4-fold	111.2	90.2	125.9
1961	330.7	211.1	553.6	61.8	78.4	53.5
1962	275.9	193.5	428.4	83.4	91.6	77.4
1963	299.4	198.1	487.8	108.5	102.3	113.8

1965	452.6	344.5	650.6	126.4	147.7	110.2
1966	547.4	394.3	829.5	120.9	114.5	127.5
1967	471.8	366.4	663.6	86.2	92.9	80.0
1968	448.0	348.3	629.8	95.0	95.1	94.9
1969	601.6	436.1	906.6	134.3	125.2	143.9
1970	786.0	514.9	12.9-fold	130.7	118.1	142.3
1971	903.3	548.2	15.7-fold	114.9	106.5	121.4
1972	962.9	582.2	16.8-fold	106.6	106.2	107.0
1973	10.5-fold	643.6	18.2-fold	109.5	110.6	108.7
1974	10.6-fold	660.6	17.9-fold	100.3	102.7	98.4
1975	12.2-fold	746.4	20.9-fold	115.1	113.0	116.8
1976	12.3-fold	766.4	21 -fold	101.3	102.4	100.5
1977	14.1-fold	873.7	24 -fold	114.3	114.3	114.3
1978	16 -fold	968.1	27.8-fold	113.5	110.8	115.6
1979	17.3-fold	10.6-fold	29.9-fold	108.5	109.6	107.7

Note: The fixed price of gross value of industrial output has been changed three times. Therefore, the index is calculated on the basis of fixed prices.

Gross Value of Output of Major Industrial Sectors

Industrial sector	1952	1957	1965	1975	1979
National grand total (100 million yuan)	343.3	784.0	1,393.9	3,218.8	4,590.7
Of which:					
Metallurgical industry	20.2	60.0	149.5	288.3	410.3
Power industry	4.3	11.7	43.1	124.7	176.7
Coal industry	8.3	20.6	36.0	90.0	118.1
Petroleum industry	1.8	8.0	45.1	179.8	249.6
Chemical industry	16.6	48.2	179.4	364.5	561.8
Of which: chemical fertilizer, agricultural chemicals	0.37	1.63	26.2	61.4	106.9
Machinery industry	39.0	119.0	310.2	890.5	1,244.8
Of which: agricultural machinery	0.87	2.81	14.3	82.3	109.1
Construction material industry	10.3	22.7	39.6	99.95	167.3
Forestry industry	22.3	40.6	39.9	61.1	84.8
Food industry	82.8	138.4	175.5	386.1	518.7
Textile industry	94.3	143.6	220.7	396.1	593.1
Paper-making industry	7.6	15.4	24.5	41.4	60.3
% of national GVIO	100	100	100	100	100
Metallurgical industry	5.9	8.5	10.7	9.0	8.9
Power industry	1.3	1.7	3.1	3.9	3.8
Coal industry	2.4	2.9	2.6	2.8	2.6
Petroleum industry	0.5	1.1	3.2	5.6	5.4
Chemical industry	4.8	6.8	12.9	11.3	12.2
Of which: chemical fertilizer, agricultural chemicals	0.1	0.2	1.9	1.9	2.3
Machinery industry	11.4	16.9	22.3	27.7	27.1
Of which: agricultural machinery	0.3	0.4	1.0	2.6	2.4
Construction material industry	3.0	3.2	2.8	3.1	3.6
Forestry industry	6.5	5.8	2.9	1.9	1.8
Food industry	24.1	19.7	12.6	12.0	11.3
Textile industry	27.5	20.4	15.8	12.3	12.9
Paper-making industry	2.2	2.2	1.8	1.3	1.3

Note: The figures for 1952 were calculated on the basis of the fixed prices of 1952; that for 1957-1970, of 1975; that for 1975 and 1979, of 1970.

Index of Gross Value of Output of Major Industrial Sectors

(Using 1952 as 100)

Industrial sector	1957	1965	1975	1979
GVIO	228.6	452.6	1,216.4	1,734.4
Of which:				
Metallurgical industry	359.4	895.6	1,768.5	2,516.9
Power industry	253.5	934.0	2,699.1	3,824.6
Coal industry	220.5	385.2	762.5	1,000.6
Petroleum industry	411.1	2,317.8	10,703.1	16.342.5
Chemical industry	389.2	1,449.0	5,294.8	7,782.4
Including: Chemical fertilizer, agricultural chemicals	632.4	10,164.4	33,306.7	57,988.5
Machinery industry	366.7	955.9	3,783.0	5,288.2
Including: Agricultural machinery	434.5	2,211.4	17,420.7	23,093.5
Construction material industry	248.5	433.3	1,170.4	1,959.0
Forestry industry	190.1	186.9	243.5	337.9
Food industry	185.5	235.4	397.3	533.8
Textile industry	151.1	232.2	419.3	627.8
Paper-making industry	239.5	381.0	611.7	891.1

Note: This table is calculated on the basis of fixed prices.

Output of Major Industrial Products

Items	Unit	1949	1952	1957	1965	1975	1979
Crude coal	100 million tons	0.32	0.66	1.31	2.32	4.82	6.35
Crude oil	10,000 tons	12	44	146	1,131	7,706	10,615
Natural gas	100 million m^3	0.07	0.08	0.7	11.0	88.5	145.1
Generated power	100 million kwh	43	73	193	676	1,958	2,820
Including: hydro-electricity	100 million kwh	7	13	48	104	476	501
Finished steel	10,000 tons	13	106	415	881	1,622	2,497
Steel	10,000 tons	15.8	135	535	1,223	2,390	3,448
Pig iron	10,000 tons	25	193	594	1,077	2,449	3,673
Machine-made coke	10,000 tons	43	222	555	1,203	2,738	3,354
Lumber	10,000 m^3	567	1,120	2,787	3,978	4,626	5,439
Cement	10,000 tons	66	286	686	1,634	4,626	7,390
Plate glass	10,000 standard cases	108	213	462	687	1,453	2,330
Sulfuric acid	10,000 tons	4.0	19.0	63.2	234.0	484.7	699.8
Soda ash	10,000 tons	8.8	19.2	50.6	88.2	124.3	148.6
Caustic soda	10,000 tons	1.5	7.9	19.8	55.6	128.9	182.6
Synthetic ammonia	10,000 tons	0.5	3.8	15.3	148.4	607.7	1,348.2
Agricultural chemical fertilizer	10,000 tons	0.6	3.9	15.1	172.6	524.7	1,065.4
Of which: nitrogen fertilizer	10,000 tons	0.6	3.9	12.9	103.7	370.9	882.1
phosphate fertilizer	10,000 tons			2.2	68.8	153.1	181.7
Insecticides	10,000 tons		0.2	6.5	19.3	42.2	53.7
Plastics	10,000 tons		0.2	1.3	9.7	33.0	79.3
Tires	10,000 units	3	42	88	232	700	1,169

Note: Lumber indicates the quantity transported. Before 1961 it was the output of log. After 1962 it included small-sized lumber materials.

Agricultural chemical fertilizer is figured by the percentage of nitrogen, phosphorus, and potassium.

Power generating equipment includes 500-kw water turbogenerators, steam turbogenerators, and gas turbine generators.

Alternating motors refer to those having 0.5-kw of power or more.

Cotton yarn includes pure cotton yarn, cotton mixed yarn and cotton type pure fine yarn; it excludes cotton velvet, substitute fiber yarn, and handwoven yarn.

Cotton cloth includes pure cotton cloth, cotton mixed interwoven cloth, pure chemical fiber cotton cloth and cotton canvas cloth but excludes substitute fiber cloth, handwoven cotton cloth, or cord fabric.

Silk does not include hand-made silk reeling.

Gunnysacks include pure flax, flax fiber mix, pure chemical fibers, and those made with substitute fibers. They do not include hand-made gunnysacks or reprocessed gunnysacks.

Index of Output of Major Industrial Products

(Using 1952 as 100)

Items	1957	1965	1975	1979
Raw coal	198.5	351.5	730.3	962.1
Crude oil	331.8	2,570.5	17,513.6	24,125.0
Generated power	264.4	926.0	2,682.2	3,863.0
Of which: hydroelectricity	369.2	800.0	3,661.5	3,853.8
Finished steel	391.5	831.1	1,530.2	2,355.7
Steel	396.3	905.9	1,770.4	2,554.1
Pig iron	307.8	558.0	1,268.9	1,903.1
Machine-made coke	250.0	541.9	1,233.3	1,510.8
Lumber	248.8	355.2	413.0	485.6
Cement	239.9	571.3	1,617.5	2,583.9
Plate glass	216.9	322.5	682.2	1,093.9
Sulfuric acid	332.6	1,231.6	2,551.1	3,683.2
Soda ash	263.5	459.4	647.4	774.0
Caustic soda	250.6	703.8	1,631.6	2,311.4
Synthetic ammonia	402.6	3,905.3	15,992.1	35.478.9
Agricultural chemical fertilizer	387.2	4,425.6	13,453.8	27,317.9
Including: nitrogenous fertilizer	330.8	2,659.0	9,510.3	22,617.9
Insecticide	3,250.0	9,650.0	21,100.0	26,850.0
Plastics	650.0	4,852.0	16,500.0	39,650.0
Tires	209.5	552.4	1,666.7	2,783.3
Mining equipment	2,938.0	2,222.2	10,894.4	14,650.0
Metallurgical equipment	6,900.0	8,700.0	41,050.0	36,450.0
Chemical equipment	720.0	3,420.0	7,590.0	6,640.0
Power generating equipment	3,300.0	11,383.3	82,750.0	103,533.3
Alternating motors	228.1	632.8	4,373.4	5,567.2
Transformers	359.0	699.1	3,501.7	4,976.9
Pumps	364.3	1,107.1	8,485.7	8,971.4
Metal cutting machine tools	204.4	289.1	1,276.6	1,019.0
Forging equipment	263.6	681.8	4,063.6	3,272.7
Roller bearings	898.3	2,610.2	13,790.7	18,235.6
Internal combustion engines	1,725.0	6,975.0	58,700.0	72,700.0
Locomotives	835.0	730.0	2,630.0	2,865.0
Railway freight cars	125.9	50.0	270.7	275.9
Railway passenger cars	7,566.7	2,666.7	13,400.0	14,266.7
Steel boats for civil use	769.0	615.5	1,910.7	3,298.8
Cotton yarn	128.7	198.2	321.3	401.7
Cotton cloth	131.9	164.0	245.4	317.2

Item	1952	1957	1965	1975	1979
Social commodity retail sales	265.0	461.0	657.3	1,246.1	1,752.5
Urban area	113.8	225.2	325.9	581.9	767.7
Rural area	151.2	235.8	331.4	664.2	984.8
1. Consumer goods retail sales	250.9	428.4	577.1	1,021.4	1,428.5
a. Divided on basis of urban and rural areas:					
Cities and towns	113.8	225.2	325.9	581.9	767.7
Rural areas	137.1	203.2	251.2	439.5	660.8
b. Divided in accordance with the consumers or buyers:					
Retail sales of consumer goods to the inhabitants	226.1	382.1	524.1	897.8	1,264.2
Retail sales of consumer goods to social groups	24.8	46.3	53.0	123.6	164.3
c. Divided according to category:					
Foods	136.5	227.8	314.5	530.8	717.5
Clothing	50.8	82.6	112.5	219.4	339.2
Daily necessities	39.5	65.3	68.6	126.5	185.0
Cultural and educational supplies	6.7	12.7	17.3	29.3	55.4
Books, newspapers and magazines	2.0	4.9	6.4	9.8	16.4
Chinese and western medicines and medical equipment and materials	6.8	16.7	27.8	57.1	58.5
Fuels	8.6	18.4	30.0	48.5	56.5
2. Retail sales of the means of agricultural production	14.1	32.6	80.2	224.7	324.0

Note: This table does not include the retail sales by peasants to the nonagricultural inhabitants. This also holds true in the subsequent tables.

Index of Social Commodity Retail Sale Volume

Item	Index (1952 being 100)				Average annual increase % for 1953-1979
	1957	1965	1975	1979	
Social commodity retail sale volume	174.0	248.0	470.2	661.3	7.2
Cities and towns	197.9	286.4	511.3	674.6	7.3
Rural areas	156.0	219.2	439.3	651.3	7.2
1. Consumer goods retail sale volume	170.7	230.0	407.1	569.4	6.7
a. Divided on the basis of urban and rural areas:					
Cities and towns	197.9	286.4	511.3	674.6	7.3
Rural areas	148.2	183.2	320.6	482.0	6.0
b. Divided on the basis of the consumers or buyers:					
Retail sales of consumer goods to the inhabitants	169.0	231.8	397.1	559.1	6.6
Retail sales of consumer goods to social groups	186.7	213.7	498.4	662.5	7.3
c. Divided according to the categories of commodities:					
Foods	166.9	230.4	388.9	525.6	6.3
Clothing	162.6	221.5	431.9	667.7	7.3
Daily necessities	165.3	173.7	320.3	468.4	5.9
Cultural and educational supplies	189.6	258.2	437.3	826.9	8.1
Books, newspapers and magazines	245.0	320.0	490.0	820.0	8.1
Chinese and western medicines and medical equipment and materials	245.6	408.8	839.7	860.3	8.3
Fuels	214.0	348.8	564.0	657.0	7.2
2. Retail sale volume of the means of agricultural production	231.2	568.8	1,593.6	2,297.9	12.3

Retail Sales of Social Consumer Goods

Names of items	Unit	1952	1957	1965	1975	1979

Average Yearly Consumption of Inhabitants

Year	Inhabitants' consumption level (yuan, on the basis of prices for that year)			Index (on the basis of comparable prices and taking 1952 as 100)		
	Inhabitants in the country	Peasants	Non-agricultural inhabitants	Inhabitants in the country	Peasants	Non-agricultural inhabitants
1952	76	62	148	100	100	100
1957	102	79	205	122.9	117.1	126.3
1965	125	100	237	126.4	116.0	136.5
1975	158	124	324	156.9	143.1	181.1
1979	197	152	406	184.9	165.2	214.5

Note: This table was computed on the basis of the total individual consumption from the use amount of the national revenue and the average population.

The Basic Living Conditions of Workers and Employees' Families

Item	Unit	1957	1964	4th quarter 1980
1. Average number of persons per family	person	4.37	5.30	4.30
2. Average number of persons employed per family	"	1.33	1.56	2.35
3. Average number of persons supported by one employed person (including the employed person himself)	"	3.29	3.40	1.83
4. Average income per person per month	yuan	21.13	20.29	42.80
5. Average living expense income per person per month	"	19.62	18.92	37.70

Note: 1. The 1957 data was adjusted on the basis of the survey data of 5,900 families of employees and workers with industrial enterprises owned by the whole people in 27 large- and medium-sized cities during the first half of the year and of 4,800 families of employees and workers with industrial enterprises owned by the whole people in 32 large- and medium-sized cities during the second half of the year.

2. The 1964 data was adjusted on the basis of the survey data of 3,537 families of employees and workers with industrial enterprises owned by the whole people, commercial establishments, cultural and educational (TN: the words public health were deleted) organizations, and government institutions in 40 large- and medium-sized cities.

3. The data for the 4th quarter of 1980 was adjusted in accordance with the survey data of 7,962 families of employees and workers with industrial enterprises owned by the whole people and capital construction, agricultural and forestry, communications, postal and telecommunications, commercial, urban public utility, scientific, cultural and educational, and financial units and government institutions and departments in 44 large- and medium-sized cities.

The scopes of the 3 years' investigations were different. For this reason, the figures cannot be compared entirely.

Average Consumption per Person of Commune Member Families

Item	Unit	Absolute number		Increases and decreases Comparing 1979 with 1978	
		1978	1979	Absolute number	%
Grains (unprocessed food grain)	Kg	248	257	9	3.6
Of which: *Wheat and rice					
*[This was deleted in the published version]					
Vegetables	"	137	131	-6	-4.4

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

VALUE OF CADRES' WEEKEND LABOR STRESSED

OW070502 Beijing XINHUA Domestic Service in Chinese 1210 GMT 6 Nov 81

[Text] Beijing, 6 Nov (XINHUA)--Both Renmin Ribao and Guangming Ribao today carry commentator's articles on reinstitution of the system of cadres' participation in labor and sanitary work on weekends by organizations directly under the central authorities. The articles point out: reinstitution of the system of cadres doing cleaning and sanitary work on weekends is a good beginning in improving the style of work by leading cadres at various levels. This has further strengthened the relations between the party and the masses and between the cadres and the masses and has encouraged people to change their mental outlook.

The Renmin Ribao commentator's article entitled "It Is Not a Trifle as Insignificant as a 'Seasame Seed' but a 'Breakthrough'" says: Leading comrades of the CCP Central Committee secretariat and many other departments have participated in labor as ordinary workers. This has strengthened the relations between the cadres and the masses, has promoted the development of work and has received favorable response from society. More and more people have come to understand the great significance of this sytem.

The article says: that cadres do cleaning and sanitary work on weekends is not a major matter, but its significance is not to be belittled. One of the great tasks now facing us is building a highly developed spiritual civilization while building a highly developed material civilization. Cadres should take the lead in doing cleaning and sanitary work in order to create a beautiful environment for work, study and life. Every Chinese with national self-respect strongly desires to create a "beautiful environment," which is a starting point for building prosperous, civilized, stable and beautiful modern cities as well as a good beginning in improving the work style of leading cadres at various levels.

The Guangmin Ribao commentator's article entitled "Make a Breakthrough at a Point to Promote Work in Other Areas" says: One must neither give mere lip service to bracing up to make China strong and prosperous nor brag or engage in empty talk in this regard. One must grasp some specific matters and work hard to solve them in a practical way in order to promote the development of work and to arouse the enthusiasm of the masses in building a modern, powerful socialist country. By grasping the matter of doing cleaning and sanitary work on weekends, the organizations directly under the central authorities have promoted the improvement of the style of leadership, have further strengthened the relations between the party and the masses and between the cadres and the masses and have strengthened people's sense of organization and discipline. In a word, this has promoted the change in people's mental outlook. Doing a good job in sanitation and strengthening our revolutionary spirit are indispensable for building a socialist spiritual civilization and are by no means a tirfle as insignificant as a "seasame seed."

ECONOMIC MANAGEMENT

SYSTEM OF REMUNERATION ACCORDING TO OUTPUT IN INDUSTRY DETAILED

Xian SHAANXI RIBAO in Chinese 23 Sep 81 p 3

[Article: "Discussion of the System of Economic Responsibility Linking Production to Remuneration in Industrial Production"]

[Text] Guided by the spirit of the Third Plenary Session of the 11th Party Central Committee during the past several years cadres and the masses in numerous industrial enterprises everywhere in the country have emancipated their mentality to act courageously in establishing and perfection a system of economic responsibility in which production is linked to the calculation of remuneration as a method of reforming the management of enterprises. This has created some effective and workable forms of experience and has scored heartening achievements.

By the so-called system of economic responsibility linking production to the calculation of remuneration is meant a clear formulation of the authority responsibilities to be undertaken, and profits to be obtained individually by central government departments, by localities, by enterprises, and by individual workers, the "authority, responsibilities, and benefits" of all three being closely interwoven so that they take the lead in caring about production, actively reform administration and management, pay attention to economic results, better fulfill state plan quotas, and assure that all economic links in social reproduction are given expression.

Institution of an economic system of responsibility linking production to calculation of remuneration most certainly is not an expedient measure, but rather is a fundamental principle to be respected in economic management. Lenin said, "The fundamental principle of management is full responsibility of a specific individual for the specific work he manages." ("Collected Works of Lenin," Vol 36 p 554) Here Lenin made a system of responsibility the fundamental principle of management. This was because without a system of responsibility, there can be no discussion of management. So-called management is, in the final analysis, simply organization. Economic management of industrial enterprises means the means and methods whereby industrial enterprise's economic activities are organized. Management of modern industrial enterprises cannot be without a system of economic responsibility that links production to the compensation of remuneration. To negate systems of economic responsibility is, in fact, to negate economic management.

Institution of a system of economic responsibility linking production to the calculation of remuneration is also a requirement in socialist modern large-scale production. Generally speaking, in farily large scale common social endeavors, various forms of a system of responsibility, are necessary in order to coordinate various aspects of social reproduction. Furthermore, with advances in science and technology, the ever increasing degree of socialization of production, the ever increasing large scale, the ever finer division of labor, and the ever closer coordination of individual links, the more tight scientific management and strict systems of responsibility are needed. Under socialist conditions, in particular, with their socialization of production and public ownership of the means of production, individual components of the national economy form a unified whole. In the system of internal division of labor in industrial enterprises, the activities of laboratory, workshop, workshop section, team and group, as well as of every producer possess a high degree of uniformity and continuity. All economic activities, all production links, and all work positions play a role in the enterprises that is an inseparable, organic, integral part. In order to assure normal operation of all production activities in an enterprise, to save manpower, materials, and financial resources, to increase the earnings of the state, the enterprise, and staff and workers, a strict economic system of responsibility must be established from top to bottom.

In a socialist society, institution of a system of economic responsibility also meets the requirement of distributions according to work. Lenin capsulized the fundamental characteristic of a socialist economic system as being public ownership of the means of production, and distribution according to work. Public ownership and distribution according to work are closely interrelated; without public ownership, there can be no distribution according to work. Likewise, without distribution according to work, public ownership cannot be realized. However, experience in the building of socialism, has shown that institution of public ownership of the means of production is comparatively easy, but comprehensive implementation of distribution according to work poses numerous difficulties. In a culturally and economically backward socialist country, in particular, this is especially true. Following establishment of public ownership of the means of production, two possibilities still exist. One is institution of distribution according to work whereby public ownership and distribution according to work are mutually combined and mutually supportive. The other is the practice of egalitarianism and "eating out of a large common pot," whereby the system of ownership and distribution according to work are mutually separated and mutually opposed. But how can public ownership and distribution according to work be linked together? We have made many detours and suffered very great hardships in the past. The positive and negative experiences of the past more than 20 years tell us that institution by industrial enterprises of systems of economic responsibility linking production to the calculation of remuneration are an effective way to surmount egalitarianism, realize distribution according to work, and consolidate socialist public ownership.

Institution of systems of economic responsibility linking production to the calculation of remuneration in industry constitute a major reform in the industrial management system. Its ramifications are very broad, and the work is extremely complex. Right now it is necessary to give attention to solution of the following several problems:

1. Continued elimination of "leftist" influence.

As a result of "leftist" ideology's influence, for a long time the mentality of many cadres has been shackled and in a rut, not daring to innovate. Practice of a system of economic responsibility requires continued elimination of the influence of "leftist" ideology. Now is the time to take in hand the restructuring and building of leadership groups for concerted solution to cadre attitudes of "indolence, complacency, and fear." By "indolence" is meant not using one's brains to figure out ways of doing things, waiting for higher authority to make arrangements, relying on higher authority for instructions, and being accustomed to doing things by the book. By "complacency" is meant contentment with things the way they are, seeking only to get by, not desiring innovation, no sensitivity to new things, not giving support, not studying new problems, and not solving problems. By "fear" is meant fear of difficulties, fear of responsibilities, fear of taking risks, and fear of making mistakes. Leadership cadres in enterprises, in particular, should arouse their spirit and dare, in a seeking for truth in facts to bring order out of chaos, and dare to tackle problems. Unless they do, it will be hard to get on with the job, and once the job gets underway, it will be hard to keep up the momentum.

2. Need for clear assessment norms and for advanced and fair quotas.

A good job of managing the breaking down of norms and quotas is a prerequisite to advancement of a system of economic responsibility linking production to calculation of remuneration. Enterprises have to translate into norms matters such as quantity, quality, cost, profits, and such matters as safety, attendance, operations, and discipline, implementing these norms in workshops and among teams and groups, and individual workers. For everything there should be norms, and everybody should shoulder norms, making responsibility mean norms. Furthermore, on the basis of detailed data about fulfillment of various norms, evaluation and calculation of reward funds (or fluctuating wages) should be instituted so that assessment becomes data based on awards discriminated.

Currently, of most importance in strengthening fundamental work in enterprises is attention to fixed quota management work. Requiring attention first of all is labor quotas, materials consumption and energy consumption quotas. Quotas must be fairly arrived at and conscientiously put into effect. There must be strict statistical measurements, and the establishment and perfection of a system of original records and various regulations. Facts show that when there are clear assessment norms, their promotion is easy, and when there are advanced and fair quotas, economic results are remarkable.

3. Strengthening of economic accounting and doing a good job of analyzing economic activity.

Economic accounting should be made a fundamental system for management of socialist enterprises. Enterprises instituting a system of economic responsibility linking production to calculation of remuneration should set up and perfect a three tier accounting for the entire plant, each workshop, and each team and group (two tier accounting when three tiers do not exist). Furthermore, they should gradually move toward participation in comprehensive economic accounting by the entire plant (each individual field), the entire production process (from designing to development, to production, to products leaving the plant), and all personnel (from leaders to cadres to workers). The system of economic responsibility should be made a reality using the minimum expenditure of labor to achieve maximum economic results.

Institution of a system of economic responsibility linking production to calculation of remuneration also requires good analysis of the enterprise's various economic activities. A system for periodic analysis of economic activities for the entire plant and workshops must be established, monthly, quarterly, and annual analyses made of the fulfilment of individual economic quotas for an all around understanding of economic activities, and constant control over economic trends so that one has plans in mind and can propose measures for improvements and the orientation of efforts.

4. Need for strict enforcement of the law and clearly defined rewards and punishments.

Only through a combination of assessments and a system of rewards and punishments can a system of economic responsibility that links production to the calculation of remuneration be assured of implementation. The crux lies in handling matters in accordance with a system. In the process of execution, no matter whether a person is a leader or one of the masses, a cadre or a worker, he must be dealt with equally and without discrimination. Those deserving of rewards should be rewarded, and those deserving of punishments should be punished, a clear distinction existing between rewards and penalties. If consideration is given because of sensibilities or "relationships," instead of handling matters in accordance with regulations, sooner or later, the system will exist in name but not in fact and will drift into formalism.

Institution of a system of economic responsibility linking production to the calculation of remuneration must also be combined with economic legislation, the system of responsibility for industrial production using the form of economic legislation for consolidation and relative stability. For illegal conduct such as violation of financial and economic discipline, wildly jacking up costs, indiscriminately issuing bonuses, practicing fraud, evading taxes, and illegally raising prices, in addition to deprivation of a share in profits and bonuses, depending on the seriousness of the situation, such persons will be appropriately disciplined and punished.

'RENMIN RIBAO' CITES CIRCULAR ON ENTERPRISE MANAGEMENT

OW070822 Beijing XINHUA in English 0745 GMT 7 Nov 81

[Text] Beijing, 7 November (XINHUA)--Industrial enterprises throughout China have again been urged to fulfill their state production quotas and strive for the highest standards of output and quality that have been attained in their provinces, autonomous regions and municipalities.

Enterprises must tap potential and improve economic results of production to increase state revenue, according to a circular issued by the state economic commission last month. The circular was approved by the state council.

The circular calls for continuous improvement of enterprise management, saying that this is an "important, pressing task" now confronting factories and mines throughout China.

Today's "PEOPLE'S DAILY" and other leading newspapers of Beijing feature a front-page story on the circular. The newspapers also list the six criteria proposed in the circular for judging the management of an enterprise.

In addition to fulfilling state quotas and attaining the best provincial technical and economic standards, the circular urges enterprises to imporve methods of economic accounting and perfect the job responsibility and overall quality control systems.

It says that in every enterprise, there must be a leading body that upholds the "four basic principles," namely, the Communist Party leadership, the dictatorship of the proletariat, the socialist road and Marxism-Leninism-Mao Zedong Thought. The members of this leading body must be relatively young and vigorous in work. The director and his deputies must be good at production and management.

The circular recommends that the director of an enterprise be given full responsibility for production and administrative work under the leadership of the factory party committee. There should also be the congress of workers' representatives working under the leadership of the party committee, through which workers participate in the management of the factory.

An enterprise will be regarded as good only when workers have become competent in their work, says the circular. Improvement of staff welfare along with improvement of production is the last criterion.

A lot has been done in the past few years to overcome chaos in enterprises to return them to normal, efficient working orders, the circular says.

Nevertheless, the circular notes, the results of the work for the entire country "cannot be overestimated," despite marked improvement in some enterprises.

People have failed to do a solid job in improving management in most cases, and management is still poor in some factories, it says.

The circular stresses: if these problems are not overcome, it will be impossible for China to attain a fair rate of economic growth in the near future to prepare the ground for still faster expansion.

ECONOMIC MANAGEMENT

INDUSTRIAL SYSTEMS OF RESPONSIBILITY CREDITED WITH INCREASING PROFITS

Guangzhou GUANGZHOU RIBAO in Chinese 3 Oct 81 p 1

[Article by Huang Lianyue [7806 6647 1878] and Mai Rongshen [7796 2837 8590]: "More Than Half the Industrial Plants and Enterprises in the City Promote Systems of Economic Responsibility; Has Played Role in Changing 'Eating Out of a Large Common Pot' Phenomenon and in Increasing Enterprise Economic Benefits"]

[Text] Statistics from units concerned as of the end of August show that of the 729 enterprises in the 10 industrial bureaus on Guangzhou's industrial front line, 453 plants and enterprises have promoted various forms of internal systems of economic responsibility. This amounts to 62.14 percent of all enterprises. This has played a very great role in changing the phenomenon within enterprises of "eating out of a large common pot," and has increased the economic effectiveness of enterprises.

The systems of responsibility that these enterprises have established internally are of various kinds, but may be characterized as follows:

First, level by level implementation within enterprises of "contracting." This has aroused the enthusiasm of staff and workers in enterprises, and production has risen tremendously. For example, after the polyester brightening workshop of the Jianhong Chemical Plant signed contracts for production, workers made concerted efforts, and worked hard and skillfully, changing the former "three step method" of brightening polyester to a "one step method." Monthly output rose from 5 tons to 15 tons. After the Guangzhou Light Bulb Plant instituted a system of economic responsibility last year, production rapidly expanded. Fluorescent light output for the year reached 1.9 million, which was a threefold increase over the previous year. Incandescent light bulb output increased to 18 million, an 80 percent increase over the previous year. Profits amounted to 3.29 million yuan. a 1.23 fold increase over the previous year.

Second, a concern about economic results from top to bottom. Some enterprises that had made only minuscule profits became "millionaires"; and some unprofitable enterprises cut losses or turned them into profits. Profits turned over to higher authority by some profitable enterprises increased. After profits were offset against losses in industries throughout the metallurgy system in 1979, annual losses averaged 10 million yuan. But in 1980 after the metallurgy bureau instituted various forms of economic contracting with subordinate enterprises, and contracting was carried out level by level within enterprises, both cadres and the masses alike gave extreme attention to economic results. Numerous shops that had long had losses turned losses into profits, and net profits of 19.43 million yuan were realized throughout the industry. During the first half of this year, profits of 10.63 million yuan were realized, double the amount for the same period last year. After some enterprises in the light industry system gradually instituted internal systems of economic responsibility, output shot up tremendously during the first half of this year, and profits of individual enterprises increased over the same period last year.

Third, gradual surmounting of egalitarianism in distributions within enterprises for an increase in worker enthusiasm for production. Beginning this year, the Guangzhou Sulfuric Acid Plant promoted a system of economic responsibility of contracting for output, calculation of remuneration being linked to output. Because distributions of reward funds was done rather fairly, worker enthusiasm for production was aroused. Between January and August of this year, the plant attained national advanced levels in all categories of economic and technical criteria and was designed an advanced enterprise by the Ministry of Chemical Industry.

Generally speaking results have been good from promotion of systems of responsibility within enterprises by plants and enterprises in Guangzhou. However, because not much time has elapsed and because of insufficient experience, some ways of doing things have not been completely perfected and further exploration and experience is necessary. Efforts also have to be made in getting plants and enterprises that have not yet instituted internal systems of economic responsibility to quickly and skillfully promote internal systems of economic responsibility.

RURAL TAX COLLECTION PROBLEMS AIRED

Beijing CAIZHENG [FINANCE] in Chinese No 10, 5 Oct 81 p 33

[Article by Li Jiangqing [2651 3068 3237], Yanbei Tax Office, Jinshan County, Juizhou Province: "Difficulties in the Work of Us Rural Tax Collectors"]

When I read the article on tax collection work in issue number 10 of CAIZHENG [FINANCE], as a grassroots level tax collector I was very much inspired. I felt we are directly responsible for organizing collection of revenues, and that our duties in balancing fiscal revenues and expenditures and in making a contribution to meeting national economic readjustment are a major responsibility and a glorious task. However, at the present time rural grassroots level tax work also faces some really difficult problems, and I would like to tell of several difficulties below.

1. Some commune and brigade enterprises are currently commune and brigade enterprises only in name and are, in fact, contracted by a small number of people. Tax monies they should pay to the state are difficult to collect for long periods of time for payment into the national treasury. Because payment must be pressed for many times, and because the feelings of taxpaying comrades may be hurt, since all are local people, it is not possible to be as strict as one should, and this leads to procrastination and more procrastination in the payment of taxes due, with no means of solving the problem.

2. When tax collections come down to the grassroots level, they are "stymied." When "notices" from the Tax Bureau of the Ministry of Finance are issued to the grassroots, indoctrination can be organized in towns. But in rural areas, they are only pasted on walls, and the job is considered done. We are now in a frontline position in taking care of levies, and people frequently curse us, or sometimes even beat us. When such things happen, most people stand at the side and regard it as a joke. Even staff and employees of the state rarely come forward to say a few reasonable words. It is just as comrades say, when you do tax collection work you "offend a lot of people and have few friends."

Year in year out grassroots level tax collection personnel run hither and thither in rural villages, sometimes a single person being responsible for several communes, the number of households from which taxes are to be collected running into the tens of thousands. In order to collect a tenth of a yuan, they have to run back and forth many times. Yet, tax collectors face difficulties in food and a place to sleep. At the present time none of our grassroots level collection points has a house to live in or a messhall. When night comes, all we can do is depend on others to find a place to rest.

4. At the present time some tax collector comrades have a low cultural level, and some cannot even write their names very well. In tax collection work, with its strong policy emphasis, this is far from meeting work requirements.

I think that in order to do a good job of rural grassroots tax work, serious attention must be given solution of the aforestated problems.

MINERAL RESOURCES

BRIEFS

TECHNICAL TRANSFORMATION IN GOLD MINING--The reported has obtained the following from those concerned in the Ministry of Metallurgical Industry. A fine situation such as had not existed since the founding of the People's Republic has taken place in China's gold science and technology and production. Last year gold production exceeded the all-time record, and output again increased this year over last year. All state gold mine bases are giving great attention to reforms in technology and have adopted advanced techniques whereby production steadily rises. For example, last year the Honghuagou Gold Mine aroused the masses to reform the mining method, changing from the qiankongliu [3239 1313 3966] mining method to the filling method [0339 1050 3127], to reduce losses through dilution and increase the grade of ore produced for overfulfillment of annual output. New developments have also occurred in recent years in the collectively owned gold mining industry. In Liaoning, Nei Monggol, and Hebei, the masses have been aroused and given support in gold mining, and many places have instituted policies of "using gold to nurture agriculture." This has both aroused collective peasant enthusiasm for gold mining, and has resulted in the use of income derived from gold mining to support agriculture and commune and brigade enterprises. Following technological renovation, several tens of small mechanized mines have been opened, and initial changes have taken place in the technologically backward methods of collective peasant gold mines. Concurrent with the support given to gold mining have been commensurate attention to gold survey and prospecting work, and a group of mining areas with long range prospects and requiring further development have been found. LIAONING'S LIGHT INDUSTRY EXAMINED

HK200907 Beijing JINGJI GUANLI Chinese No 10, 15 Oct 81 pp 11-14

[Article by Shen Yue [3088 6390]: "Some Problems Regarding the Development of the Production of Daily Use Consumer Goods"]

[Text] The development of the production of daily-use consumer goods in a big way is an important facet of national economic readjustment as well as an important strategic principle for developing the economy. Liaoning Province has been turned into a heavy industrial base with the support of the whole nation. We must proceed from the needs of the country to organize well the production of heavy industry and serve even better economic construction of the whole country. But at the same time, it is imperative to develop the production of consumer goods in a big way so that the production of the means of production will be able to further conform with the production of the means of subsistence while the economic structure is further rationalized. Since 1979, the Liaoning Privincial Party Committee has decided to fully display the advantages of heavy industry in order to support the development of light industry. In 1980, the provincial light industrial output value was 14.76 billion yuan, 41 percent higher than 1978. The light industry of our province achieved a record growth rate in 1980, with an increase of 28 percent. This continued to develop in the first half of 1981, with an increase of 13 percent over the same period last year. The proportion of light industrial products in the gross industrial output value of the whole province has increased from 26.7 percent in 1978 to the present 36 percent. The output of major light industrial products has increased drastically. For example, the output of TV sets has increased by 110 percent, electric meters increased by 210 percent, washing machines increased by 640 percent, radio receivers and cameras increased by 60 and 70 percent respectively, tape recorders, electric fans, bicycles, clocks and watches increased by 18 to 42 percent and synthetic fibers increased by 58 percent, yet all these increases still failed to meet the growth of people's purchasing power. Therefore, it is necessary to further develop light industry in our province. To solve this problem, we consider it is imperative to do well in the following:

I. Handle Well the Five Relationships in Working Out an Overall Plan

Various departments in various places have, over the last 2 years, been very enthusiastic in developing the production of daily-use consumer goods and it must be affirmed that they have made considerable achievements. But following the development of the national economy and the improvement in the standard of living of the people in both rural and urban areas, the masses will surely demand more and better consumer goods. Therefore, it is imperative to further mobilize the initiative of various departments in all places in developing the production of daily-use consumer goods. But such initiative must be based on scientific market forecasting and a comprehensive balance. This initiative must be compatible with state planning;

it must in no way be the "initiative" that disregards objective conditions and departs from needs, abilities and planning and that is characterized by rushing headlong into mass action and manufacturing in a rough and sgoy shod way. Liaoning Province recently held a second meeting on light industry, in which an overall plan was worked out with regard to the 60 varieties of famous brand products and 10 major trades. Measures were also taken to realize a comprehensive balance, arrange rational locations for the production and selection or quality products. All these measures are aimed at developing even better the production of daily-use consumer goods.

In working out an overall plan, it is imperative to correctly handle the following five relationships.

First is the relationship between developing the roles of key cities and promoting other areas. Key cities have strong industrial foundations, more backbone enterprises, more famous brand products, fairly advanced technology and higher output level; all these advantages are the result of histroical conditions. Selecting quality products entails selecting well made quality products that have numerous varieties. Therefore it is only rational, and is also necessary, that more quality products be selected from key cities and other major cities with better industrial foundations. Developing the roles of key cities does not mean putting pressure on other areas; rather, it is used to promote other areas. Thus be proceeding from economic rationality, these measures will benefit all large, medium and small cities. All things being equal, it is imperative to select quality products from those areas which are weak in light industry. It is also necessary to organize key cities and other major cities to introduce technology and spread their products to other areas in a planned way. They also develop some paid technical cooperation and economic alliances.

Second is the relationship between developing the roles of the existing enterprises and expanding and building new enterprises. In developing the production of daily-use consumer goods, we must mainly rely on the existing enterprises by tapping their potential, carrying out innovation and transformation and by making full use of the surplus workshops, equipment, funds and technical force by reorganizing and cobmining them. In principle, we must no longer build new enterprises or add basic equipment. In the future, the funds for tapping potential, innovating and transforming and for various technical measures must mainly be used in upgrading quality, expanding varieties, developing new technology and saving energy. The projects for building and expanding enterprises must be approved by the province and the state.

Third is to handle well the relationship between the places that are producing raw materials and the processing enterprises, about 60 percent of the raw materials for the light industry in our province come from agriculture. Therefore, under the precondition of ensuring grain production tasks, are fulfilled, rural areas must work hard to produce the raw materials for light industry and establish various bases for raw materials, Various industrial departments must render tremendous support in establishing such basis. The regions that have been successful in establishing the bases for the production of agricultural and sideline product raw materials, under the prerequisites of fulfilling the state production tasks, and having state approval must be permitted to process part of the raw materials in accordance with a specified quality standard. Such a measure is in the interest of mobilizing the initiative of the raw materials producing regions and the processing enterprises.

Fourth is to handle well the relationship between selecting quality products and competition. Comprehensive balance and unified planning must be realized through the rational location of enterprises and the selection of quality products so as to overcome blindness and prevent the excessive building of factories and waste. It is prohibited for each to go his own way only without considering others. But planning for the selection of quality products does not mean suffocating competition since the blockading of products from another area is impermissible. Products should be permitted to circulate freely and competition should be encouraged. Some comrades have said: "The only criterion for selecting a quality product is the final appraisal of the consumers." This is quite true. The planning that results in producing a quality product does not mean "eating does it mean that everything will be allright. If their quality fails to meet requirements, then the products will be squeezed out of the market and their production will be halted. Those enterprises which presently have not worked out such planning but have mass production capacities and salable products should continue to exist and have their fate decided in competition. Of course, such enterprises must not rely on the state investment, subsidies and tax exemptions. The state finances and materials must be used in producing quality goods or this planning will be meaningless.

Fifth is to handle well the relationship between key products and ordinary products. We must see not only the "10 big things" but must also broaden our view to develop more production methods so as to meet the various needs of the masses with regard to daily-use consumer goods. We cannot just produce "favorite products." We must learn from Changzhou Municipality in producing special products to fill in gaps in the product structure and produce more products with special features. The 60 varieties of the key products represent our backbone products and we must stress the production of goods in key cities and of famous brand products. But such products are limited. Therefore, we must work hard to produce many varieites of goods that are needed by the masses such as foodstuffs, articles for daily use, for children and for tourists, and handicraft articles. It is also necessary to work out planning and make proper arrangements, according to specific conditions, with regard to the production of small commodities and hardware. When small commodities are able to win market positions because of their good quality, they will become big products.

II. Further Promote Reorganization and Alliance of Enterprises

The main question in developing the production of daily-use consumer goods is to make full use of the foundation of the existing enterprises and to do a good job in readjusting and uniting so as to improve the level of specialization in production and raise the competitive level of the products. Both the factories that are producing major machines and those producing basic and key parts must carry out reorganization and alliance under the principle of coordination in specialization and economic rationality so that they will be able to engage in socialized production. In this way, these enterprises will be able to form a "fist" to produce famous brand and quality products. The experiences gained by Shenyang, Dalian, Dandong and Anshan municipalities in carrying out industrial reorganization and alliance of enterprises fully shows that carrying out reorganization will result in different economic effects.

For example, the Dalian Sewing Machine General Factory carried out reorganization and alliance on 2 occasions over the past 2 years. The factory now only retains the three processes of electric welding, painting and assembling and the processing of the covers and bottom plates for sewing machines. The production of the other

42 parts are undertaken by 10 subsidiaries and associated units. This measure has considerably increased productivity, with yearly production jumping from 200,000, before the reorganization, to the present 350,000. The Dandong TV parts factory organized production according to the principle of specialization to produce one type of high-frequency tube instead of the former seven types. As a result, the output has increased every year and the cost for 1 such product has dropped from 45 yuan to 18 yuan and this has greatly improved their competitiveness.

It is imperative to stress the importance of voluntary participation in reorganizing, uniting and coordinating in specialization. But if an economic comparison has been made and the feasibility has been confirmed, steps must be taken when the objective is clear. If an enterprise with seasoned conditions refuses to take measures, it must be compelled to do so by administrative means. We must handle well the relationship between leading roles and supporting roles. It is quite possible that a city or an enterprise can play a leading role in producing some products and a supporting role in producing some other products. If the supporting products are accepted by the masses as "fist" products, then these products will eventually become leading products. With regard to strengthening the comprehensive balance, the provincial party committee has decreed that the enterprises that are producing the products, which are under the control of the state and the province, must get the approval of the province before they readjust the orientation of their production and change their relationships with subordinate units. So far this year, in order to support the development of light industry, 51 enterprises that did not have production tasks allocated for the near future and did not have a long-term orientation have been transferred into the light industrial system. It is still necessary, in the future, to do a good job in readjusting the structure of industrial organizations so that Liaoning Province will be able to improve the standard of industrial specialization while the light industry will be able to mass produce quality products at low costs.

III. The Key Is to Improve the Quality of Products

The key that decides whether production of daily-use consumer goods can be developed rests on whether we are able to improve the quality of the products and produce a greater variety of famous brand products. First of all, it is necessary to heighten the ideological level and shift our work from increasing quantity and building new enterprises to improving quality and adding more varieties. From an economic view, quality products are vital and competitive and, consequently, they can be mass produced. If there is no quality, there will be no quantity. The output of those products of low quality may increase for a short time, but under acute competition at home and abroad, they will eventually be squeezed out. We must keep in mind that quality comes frist and when there are contradictions between quantity, output value and quality, these contradictions must be resolved on the basis of maintaining quality.

There must also be a drastic change in our work. The work to improve the quality of products must first of all be done well and as part of our economic work. In grasping production we must first of all grasp quality. We have decided to carry out large-scale inspection of the quality of products across the province. With the advanced level of Shanghai and other places as examples, each product, each part and process of the 60 key products will be analyzed and efforts will be made to find the factors that affect quality. We must expose contradictions, find the differences and reasons and work out measures. The problems that are found in the factories themselves, must at once be resolved by the factories through the mobilization of the masses. The problems that have to be resolved by municipalities and areas must be reported to the appropraite departments concerned who will study and solve them. The problems that cannot be resolved by municipalities and areas must quickly be reported to the relevant provincial departments. We must spare no efforts in steadily improving quality. All related bureaus, companies and enterprises must organize teams for specialized production and appoint persons to be responsible for this task. All areas, bureaus and enterprises must inspect quality once every month, test and check once every quarter, compare and appraise every 6 months and make a general comparison and appraisal each year. The enterprises that fail to meet requirements must take measures to adjust themselves within a specific period. If they fail to reach the target after a long period, they must suspend production for reform and their production plan must be abolished. It is necessary to create an atmosphere where everybody is concerned with, and pays attention to, quality.

Another step is to strengthen measures. First, in improving quality, we must first of all grasp well the quality of basic parts and key parts to ensure that the products are of high waulity. For example, if we fail to improve the quality of bicycle gears, TV tubes and screens, pedals for sewing machines, magnetic recording heads for recorders, camera shutters, timers and bearings for washing machines, miniature electric motors and components for electronics products and fail to organize the finishing works in textile industry, the quality of the related products can in no way be improved. Second, implement the principle of good prices for good quality products and low prices for low quality products as an economic lever to improve the quality of products. Third, improve quality through reorganization, alliance and specialization. Only when we are able to realize mass production with specialization in the manufacture of one particular product will we be able to raise the quality, concentrate our efforts in making specialized equipment and study specialized technology. The high-frequency television tubes produced by the Dandong TV parts factory were rated in the front rank on two occasions during national quality comparison and appraisal due to the essential measures taken by the factory in improving quality. Fourth, the funds and various loans for tapping potential, technical innovation and transformation must mainly be used in producing famous brand products and improving quality. No investments, loans and tax concessions will be available for the products that are not up to standards. Fifth, the quality of products must be tested by consumers. In this respect, the method that is employed by our provincial textile bureau is very good. It carried out production on the basis of market demand and this measure has played a big role in improving quality, adding varieties and unifying production and sales. Sixth, fully develop the roles of specialized scientific research work and the scientific research organizations set up by factories in order to closely combine research work with production. Without advanced technology there will be no advanced products. Seventh, exercise overall control over quality. The workers at each production post and in each production process must be organized so that they will be able to guarantee the quality of products through the quality of their work. Eighth, do a good job in market forecasting and in rendering technical service to customers and also investigate their needs. When work is being done to improve quality, it is also necessary to constantly develop new varieties so that we will be able to turn out quality daily-use consumer goods that are low prices, in many varieties and new designs, and are in demand.

IV. Further Develop the Advantages of Liaoning's Heavy Industry to Support Light Industry

Although we stressed the importance of developing the production of daily-use consumer goods, this does not mean we should neglect heavy industry. Heavy industrial departments must transform and readjust their production for the "four services" (to serve people's livelihood, national defense construction, technical innovation of the national economy and expansion of exports). Over the past 2 years, the cities of Dalian and Shenyang made considerable achievements and accumulated some experience in carrying out the activities of heavy industry helping light industry and light industry promoting heavy industry. We must continue to follow this road in developing the production of daily-use consumer goods and displaying the advantages of heavy industry so that we will be able to make new contributions to the light industry in our province and even that of the whole country.

How should we further develop the advantages of heavy industry in order to develop the production of daily-use consumer goods? We must mainly continue to organize heavy industry to provide various technical services and tools for light industry. The textile industry and the electronics industry and step up technical innovation of light industrial enterprises; to provide, in large quantities, good quality raw materials that are demanded by light industry, the textile industry and the electronics industry; render technical support to light industry and the textile industry so as to improve its technical level; organize heavy industrial enterprises, that have acquired certain conditions, to directly produce the daily-use consumer goods that require similar processing technology and raw materials; transfer some of the heavy industrial enterprises (that have no production tasks in the near future and no long-term orientation) to the electronics industrial system and organize heavy industrial enterprises to coordinate in making complete sets of equipment. Practice has proved that these measures are important in fully developing the advantages of heavy industry, making use of the existing industrial foundation and stepping up the development of light industry. They are also important in opening up the industrial service sectors, promoting the relationship among industries and in closely combining and coordinating the development of light industry and heavy industry.

We have set down the following policies to assist heavy industry in helping light industry. 1. The principle of the "six preferences" that has been introduced to light industrial enterpirses must also be applied to the daily-use consumer goods that are directly produced by heavy industrial enterprises and that have been included in the production planning at various levels. With regard to the supply of energy, preference must also be given to the heavy industrial enterprises that are supplying raw materials and technical equipment to light industrial enterprises. 2. In carrying out the activities of heavy industry helping light industry, the principle of mutual benefit must be followed. Neither egalitarianism, nor the indiscriminate transfer of resources nor unrewarded support are permitted. In this way, the light industrial, departments that are being supported, will be economically viable while the heavy industrial enterpirses will have a set income and in this way, both light industrial and heavy industrial enterprises will have economic interests. 3. The light industrial enterprises that are given advanced technical support by heavy industrial enterprises and that have consequently made considerable profit, have to pay a certain amount for this, or the method of compensated technical transfer may be implemented. 4. Good ideological work must be carried out with regard to the technicians and management staff who have been transferred from heavy industrial enterprises to light industrial departments. Their living conditions must be arranged well and their salaries and welfare must remain unchanged so that they will be able to work with their minds at ease.

The experiences gained over the past 2 years by Liaoning Province in launching the activities of heavy industry helping light industry and light industry promoting heavy industry show that such activities are in the interest of accelerating the development of light industry; they are also in the interest of promoting the readjustment and reform of heavy industry and of developing heavy industrial production. Thus, there are bright prospects for Liaoning Province in developing the advantages of heavy industry.

BRIEFS

JILIN MUNICIPAL INDUSTRIAL PRODUCTION--Siping Municipality, Jilin Province, achieved good results in its January-October industrial production. Industrial output value in the period is expected to increase by 6.8 percent over that of the corresponding 1980 period. It has overfulfilled by 15 percent its annual profit plan by earning 9 million yuan. The municipality is striving to make its annual industrial output value exceed 800 million yuan. DOMESTIC TRADE

SHANGHAI'S COOPERATION AGREEMENTS CALLED SUCCESSFUL

OW111256 Beijing XINHUA in English 1232 GMT 11 Nov 81

[Text] Beijing, 11 November (XINHUA)--Economic and technical cooperation between Shanghai-based enterprises and the rest of China has, in the past year, proven successful, according to a "PEOPLE'S DAILY" report.

Joint operation, compensatory trade and technology exchange contracts have been signed with other regions for timepiece manufacture, handicrafts, paper, textiles, silk, glass and other commodities, the paper said.

Joint-operation agreements require Shanghai to supply technology and equipment to the factory buildings, raw materials and labor of the other firm. Products and profits are divided by negotiated percentages.

The Echeng Clock Factory in Hubei, as the result of a joint-operation contract, increased its 1980 output from 10,000 to 30,000, and projects this year's production at 60,000, the paper said.

Compensatory-trade agreements require Shanghai to provide funds, technology and equipment, while others repay the investment with raw materials and semifinished products.

After 14 such agreements with Zhejiang and Hunan Provinces and the Guangzi Zhuang autonomous region, the Shanghai Municipal Bureau of [word indistinct] has been able to ensure 45 percent of its annual paper needs, 66 percent of its silk textile requirements and all of its silk, the paper said.

Technical-cooperation agreements require Shanghai to provide technology and managerial expertise.

The Shijiazhuang Quartz-Glass Factory in Hebei Province, after losing money for 10 years, signed a technical-cooperation agreement with the Shanghai No 1 thermosbottle factory for modernization and worker training. The Hebei Factory began to show a profit one year later, according to the paper.

A Shanghai Company has also been established to provide technical consultation to enterpirses across China, the "PEOPLE'S DAILY" said.

BRIEFS

JILIN WORKERS' LIVELIHOOD MEETING--On 21 and 22 October the Jilin Provincial Government held a meeting on investigations into the workers' livelihood. Dong Xin, deputy provincial governor, spoke at the meeting. He urged party committees and governments at all levels to show concern for the masses' livelihood, pay attention to their difficulties and gradually solve them. He said that although the provincial party committee and government had done a great amount of work to solve the people's employment and housing problems since the third plenary session of the Party Central Committee, many difficulties still remain. He urged cadres to rely on the masses to properly solve their problems and proceed from reality in conducting investigations on the masses' livelihood. UPPER-REACH RIVER PILOTS, ENGINEERS TRAINED

OW130340 Beijing XINHUA in English 0240 GMT 13 Nov 81

[Text] Chongqing, 13 November (XINHUA)--Nearly 250 navigation technicians--captains, pilots and chief engineers--have been trained for navigation on the upper reaches of the Yangtze by the Chongqing branch of the Yangtze River navigation administration in the past few years, according to administration authorities.

The technicians sail a 1,000-kilometer section of the narrow gorge zone between the city of Yibin in Sichuan and Yichang in Hubei on the upper reaches of the Yangtze. The gorge zone has swift currents and submerged reefs, the authorities said.

Methods for preparing the technicians include a crew training school in which veteran captains, pilots and chief engineers give lectures. Materials edited by these veterans include information on geography, climate and river bed conditions of the gorge navigation channel and navigation and pilot techniques for the low, middle and high water seasons.

Master-apprentice contracts have been signed between captains and trainee-turned mates on ships and, through two years of training, more than 40 of the mates have qualified as pilots and engineers, the administration said.

Many of the pilots, first mates, chief engineers and newly appointed captains are experienced workers, the administration said.

According to Duan Shurong, chief captain of the Chongqing branch of the Yangtze River navigation administration, to be a skilled captain or a chief engineer requires a dozen to 20 years' experience for navigation on the upper reaches of the river, while six or seven years' experience is enough for the navigation on the lower reaches.

With the ever-increased number of boats on the Yangtze in recent years, there are 7,000 crew members as compared with 3,000 a few years ago, including 1,100 technicians that have been trained in various navigation fields. In addition, Sichuan Provincial Steamer Company also has trained several hundred navigation technicians in the past several years, the administration said.

BRIEFS

HEILONGJIANG HARBIN-DAQING HIGHWAY--Reconstruction of the (Wanbao) to Zhaodong section of the highway linking Harbin with Daqing Municipalities, a key highway project of Heilongjiang Province, was recently completed after 1 year's work and opened to traffic. Before reconstruction, this section of highway was of low standard and could not meet the needs of transportation in the western areas of Heilongjiang. It is asphalt-surfaced, enabling vehicles to be drive at 70 kilometers per hour. [Harbin Heilongjiang Provincial Service in Mandarin 2200 GMT 27 Oct 81 SK]

HEILONGJIANG FEEDER RAILWAY--A new feeder railway was added to the railway line that starts from Nenjiang, cuts through the Da Xingan mountain range and ends at Xilinji. On 5 November, the 58.1-km feeder line, located on the north of Yilehuli mountain and connecting Tahe County and Shibazhan, was opened to traffic. This feeder line was constructed by a certain unit under the PLA Railway Corps in three months. [SK102255 Harbin Heilongjiang Provincial Service in Mandarin 2200 GMT 9 Nov 81]

GENERAL

DEVELOPMENT OF COLLECTIVE ECONOMY IN CITIES, TOWNS

Kunming YUNNAN RIBAO in Chinese 18 Sep 81 p 2 & 19 Sep 81 p 2

[Article: "Questions and Answers on Development of Collective Economy in Cities and Towns"]

[Text] Recently the provincial party committee and government put out the "Decision on Several Questions in the Development of the Urban Collective Economy" with the aim of encouraging development of collective economy in cities and towns. A number of readers have wirtten us, asking information about the main content and basic spirit of the decision. The following are answers to the questions raised by our readers.

Q. What are the guiding thoughts and principles of operation underlying the development of the urban collective economy in cities and towns?

A. The urban collectively-owned economy is an important form of socialist economy owned by the public. Vigorous development of the collective economy in cities and towns is a long-term policy to be pursued in the course of the Four Modernizations of the country. During the period of national economic readjustment, it is imperative to take effective measures to ensure greater growth of the collective economy in cities and towns of our province. In the process of its development, the collective enterprises in cities and towns should develop in the socialist direction and follow these principles: getting organized on a voluntary basis, raising their own funds under state support, participating in labor, jointly owning the means of production, practicing business accounting, assuming sole responsibility for their own profits and losses, distributing according to work, and putting management on a democratic basis.

Q. Can the leading organs at various levels practice unified business accounting and assume responsibility for the profits and losses of collective enterprises and make unified transfer and distribution of the financial resources and manpower of collective enterprises?

A. The collective enterprises in cities and towns are owned by the working masses of the enterprise collectively, and all their property (including funds, plant buildings, raw and processed materials, and products) and personnel are protected by state laws. The leading organs at various levels must respect their proprietory ownership and right to self-management. They may not distribute or transfer such property without compensation and may not repeat the former practice of arbitrarily changing the relations of production and encroaching upon the collective interests of "upgrading," "transfer to the lower level" and "transition to a higher level of ownership." The practice of assuming responsibility of the profits and losses of all enterprises is a wrong one of "eating from the same big pot." All collective units (including cooperative teams) must practice independent business accounting and assume sole responsibility for their own profits and losses. All those enterprises that have let the state assume responsibility for their profits and losses or formed larger accounting units must change back. Economic combination of collective enterprises with other economic organizations must be based on the principle of free will, equality and mutual benefit and without changing the ownership, the relations of subordination and the financial relations. Except taxes, collective enterprise funds and relevant fees to be paid by the collective enterprises according to regulations, no manpower and material and financial levies may be apportioned to collective enterprises by any unit or individual in any name; collective enterprises have the right to reject these levies.

Q. What are the provisions and requirements to be met by those who form collective units and join collective units in cities and towns?

A. All persons waiting for employment in cities and towns, who are entitled to grain rations and are registered in census records may get organized on a voluntary basis. After approval by the industrial and commercial administration they will be issued licenses to start business. Or else, through the recommendation by the labor department they may be employed selectively by existing enterprises and the length of their service shall count from the day they join the collective enterprise. If later they switch to enterprises owned by the whole people or other collective enterprises, the length of their service shall also count from the day they first joined the collective enterprise. The workers of collective enterprises in cities and towns should be treated in the same way as the workers of state-operated enterprises and may not be discriminated against in social and political activities such as joining the Party and the League, joining trade unions, electing the advanced. College graduates and the workers of state organs, state-operated enterprises and institutions may also be transferred and assigned to collective enterprises according to the requirements of collective enterprises or their personal wishes; they will enjoy political treatment and receive the same wages as they do in state-operated units and receive collective welfare benefits and awards granted by their enterprises. Their transfer to or from other enterprises will not be subject to restriction by the system of ownership.

Q. How are funds for collective enterprises raised?

A. The funds of collective enterprises should be raised mainly by enterprises themselves and supplemented with state aid. The funds may be raised in several ways. Funds may be brought into the collective enterprise by the workers themselves. Funds from different sources may be pooled. Bonuses paid to the workers may be combined with dividends on share capital. Idle funds in society may be absorbed. Part of the local financial revenues earmarked for the purpose of tapping potential and carrying out innovations and transformations may be appropriately used to support collective enterprises that produce goods which are in short supply. Part of the funds earmarked for the placement of educated youths and the unemployed may be used to help collective farms, stock farms and industrial-commercial enterprise whose main body consists of educated youths. In the case of fixed assets bought with self-raised funds, depreciation funds may be kept entirely by the enterprises concerned.

Q. What are the obligations of collective enterprises in cities and towns to the state?

A. They ought to observe state laws as well as party and government policies and decrees, pay taxes and relevant fees according to schedule, and accept the supervision and care of the departments concerned. They should conscientiously act according to the provisions of the people's government.

Q. What is the special consideration given in terms of taxation to the newly established collective enterprises in cities and towns which arranged placement for more unemployed youths?

A. Except those making cigarettes and wines, all the newly established collective enterprises shall be exempt from industrial and commercial taxes for one year from the month they start business. Those collective enterprises newly established for the placement of unemployed youths and the existing collective enterprises which arranged placement for unemployed youths exceeding 60 percent of their work force shall be exempt from industrial and commercial taxes for two years. In the case of enterprises of this type, income from labor service, repair service and business service may also be exempted from industrial and commercial taxes for two years from the day of business (or from the month in which their business is started).

Q. What is the special consideration given in terms of taxation to the collective enterprises in frontier prefectures and counties?

A. Beginning January 1, 1981, handicraft, transportation, building construction, and repair cooperative enterprises in 35 frontier counties shall be exempted from income tax for two years. In the Nujiang and Diqing Prefectures, industrial and commercial taxes on logging, wine-making, commodity retail, service trade, transportation, and provisional undertakings will be reserved and other taxes shall be exempted for two years.

Q. Is there any consideration given in terms of taxation to the newly increased profits made by collective enterprises in cities and towns?

A. As from 1980, the profit realized in 1979 is taken as the base figure and the part of profits realized in subsequent years that is in excess of the base figure shall be given a 50 percent deduction in income tax payable.

Q. What are the provisions for cooperative undertaking funds delivered to the state?

A. Under the influence of the leftist deviation in the past, it was stipulated that collective enterprises must deliver excessive cooperative undertaking funds to the state. On two occasions, the provincial government made provisions to deduct cooperative undertaking funds. Provisions are now made that as from 1980, enterprises at the county level and above shall pay 15 percent of their after-tax profits as cooperative undertaking funds and town and neighborhood enterprises shall pay 10 percent of their after-tax profits. When profit rates are too high or too low, the amount turned over to the state may be slightly adjusted by the provisional department in charge. Enterprises newly established since 1979 are exempted from payment for two years.

Q. What is meant by "double 50-percent reductions"?

A. "Double 50-percent reductions" means that the base number of the annual after-tax profits retained shall remain unchanged for several years and that the income tax on the portion of profits increased each year is reduced 50 percent and 50 percent of the cooperative undertaking funds are turned over. How the income tax is reduced 50 percent in our province has been explained in the preceding paragraph. The proportion of cooperative undertaking funds now delivered to the state is actually based on a 50 percent reduction of quota and is in the greater interests of enterprises than the 50 percent reduction in the increased portion of profits. The proportion cannot be lowered further.

Q. How should the profits retained by collective enterprises in cities and towns for their use be distributed?

A. In the case of profits retained by enterprises for their use, the portions for enlargement of production, collective welfare and bonsues to individuals should be arranged in such a way that funds are not excessively accumulated, nor are all profits distributed and used. In general, the following proportions may be taken as the guide: 60-65 percent for accumulation, 25-30 percent for public welfare fund, and 10-15 percent for labor bonuses. Labor bonuses may not exceed two months' average wages. Those enterprises that lose money will not grant labor bonuses.

Q. What are the provisions made for the wage and welfare systems of collective enterprises in cities and towns?

A. Collective enterprises in cities and towns should adhere to the principle of distribution according to work and oppose egalitarianism. Their wage and welfare benefits may be equivalent to or higher or lower than state-operated enterprises in the same trade, depending on the state of their operations. Wages may assume the forms of piece wages, floating wages, wages based on percentage profits, time wages, and bonuses. Other forms of distribution according to work may also be adopted. The forms adopted shall be decided by the enterprises themselves.

Provisions for such matters as retirement, resigning from office, resigning for recuperation, labor protection, grants to only children, pensions for the dead, etc. may be made by enterprises themselves according to their business conditions and with reference to the standards of state-operated enterprises and the relevant documents. Labor safety devices shall be supplied according to the standards of equivalent state-operated enterprises in the same trade and of the same type.

Concerning workers' grain ration standards, where supply, production and sale are normal and the types of work are permanent, grain should be supplied according to the standard of state-operated enterprises in the same trade and of the same type. Where the types of work are not permanent, 7 jin of grain per capita shall be supplied as subsidy to the enterprise each month, and the unit concerned shall make assessment and distribute supplies to its workers.

Q. What are the provisions for production, supply and marketing activities of collective enterprises in cities and towns?

A. The production activities of collective enterprises must serve as a market regulator under the guidance of state plans. Except in the case of products that must be brought into the plans at various levels, enterprises shall sign contracts with the demand side and make their own decisions in operation.

As to the raw and processed materials, fuels and supplementary materials required by collective industry and commerce enterprises, catering and service trades, they should be supplied and priced without discrimination in the same way as they are supplied to state-operated units. Their former processing relations with commerce and foreign trade departments should in general be changed into purchase-sale relations. Provisions for price reductions and compensations for goods returned should be granted to collective enterprises by state-operated commercial enterprises in light of the measures applicable to supply-marketing cooperatives.

Except in the case of products which are purchased and chosen by the commerce and commodity departments according to plans, enterprises may sell their products according to state provisions. The products sold by the enterprises themselves should be priced according to the provisions made by governments at various levels. Products whose prices are not subject to control by the administrative departments may be sold at floating prices. Prices of products sold to other provinces by the enterprises may be determined by supply and demand sides through consultations. Food products made of materials obtained through negotiated purchase may be sold at negotiated prices.

Q. How to provide plant sites required to develop collective enterprise in cities and towns?

A. Plant sites for collective enterprise should be discussed, studied and planned by the city planning department in cities and towns together with the local labor department, housing administrative department, public security department and industrial-commercial administration. Provided plant sites are selected in such a way that they facilitate economic development, meet the requirements of city planning and environmental protection and do not affect the appearance of the city and do not obstruct traffic, the matter should be given positive support and settled quickly. For example, the housing administrative department should assist in exchanging the lodgings and public houses on the street for shopping fronts or lease them out to collective enterprises for use. The department may also mark out a sector to restore the traditional stall market and small commodity market. It may temporarily lease out to collective enterprises the sites within the "red line" where construction work is not expected to start within a short period of time.

Q. What is the highest power organization of collective enterprises in cities and towns?

A. The collective enterprises in cities and towns should be democratically managed according to the principle of democratic centralism. The highest power organization of a collective enterprise is the workers' general meeting, and its executive organization is the management committee elected by workers' congress. The workers' congress and the management committee have the authority to reward, penalize and dismiss workers, to recall or remove incompetent managerial personnel, to employ managerial personnel and technical personnel. Important problems of production, construction, operation, management, and welfare benefits should be decided by the workers' general meeting through democratic discussion. Economic democracy should be promoted and accounts kept open. The responsible person of the enterprise should periodically report to the workers' general meeting on his work and accept mass supervision.

Q. How to go a step further and strengthen the leadership over the collective economy in cities and towns?

A. The provincial committee and government want party committees and governments at all levels to strengthen their leadership over the collective economy in cities and towns, to place it on the order of the day and to discuss and check it several times a year. The government at various levels should each assign a responsible comrade to take charge of this work. The provincial departments and bureaus of commerce and light industry which control a larger number of collective enterprises should set up special organizations to control collective enterprises. Ideological and political work should be strengthened. The influence of leftist ideology should be stamped out further, party policies concerning the development of collective economy should be propagated, and ideological, epistemological and practical problems should be promptly solved.

INSPECTION OF MARKET PRICES IN YUNNAN WINS INITIAL SUCCESS

Kunming YUNNAN RIBAO in Chinese 29 Sep 81 p 1

[Article by Shen Zhengcai [3088 2973 2088]: "Inspection of Market Prices Throughout Province Wins Preliminary Success; Maintains Economic Order; Assures People's Welfare]

[Text] In accordance with stipulations in pertinent documents from the State Council and the Provincial Government, inspection of prices in markets has been launched in one place after another throughout the province. Preliminary successes have been scored as of the present.

Working from inspections conducted last winter and this spring, in late June this year the Provincial People's Government again issued the "Notice on Further Strengthening of Market Controls and Continuation of Attention to Inspection of Market prices and Attacks Against Smuggling and Trafficing in Narcotics and Speculative and Profiteering Activities." At the same time, the Provincial Government assigned cadres for the organization of four work teams to go into southern, western, and northeastern Yunnan and the Kunming area to provide support to counties there in the launching of inspection work.

Judging from this phase of the inspection, all the markets in the province are booming economically, and the heartening situation of basically stable prices vigorously promotes economic readjustment and reform. Throughout this year, all jurisdictions have strenghtened leadership, and have scrutinized illegal speculation and profiteering activities, delivering deserved blows to some serious law offenders, and assuring the normal order of city and country markets. In the realm of the prices of goods, they conducted all around investigation of more than 10,000 different commodity prices for which the state has set the retail price. More than 2,000 of those commodity prices that were mistaken or omitted, they corrected. In cases where people had taken it upon themselves to raise prices and had taken more money from the masses than they should have, refunds were arranged. When refunds could not be made, the funds were paid into the local treasury. When price did not match quality, second quality being illegally represented as first quality, short weights or measurements given, or adulteration practiced, indoctrination and penalties were given on a case by case basis. More than 30 negotiated price commodities were withdrawn from the negotiated price category, and the price of more than 50 negotiated price commodities was lowered by between 4 to 20 percent. However, some problems meriting attention currently still exist. One is that some places and some units concerned do not have sufficient understanding of this work. They do not give careful attention to it;

do not handle cases vigorously, and do not act strictly, or else they pay attention only to economic penalties ignoring legal and disciplinary punishements. Second is that in a small number of units and in society, illegal elements from inside and outside collude. They use bank accounts to corner the market on goods and commodities currently in great demand in markets, gaining illegal earnings. Third is a mixing up of list and negotiated prices for commodities to raise prices covertly to the determiment of the welfare of the masses. In this regard, all jurisdictions and all units are continuing to launch price inspections and market restructuring in advance of the national anniversary and in accordance with a notice from the provincial government. Their goal is to rapidly correct the erroneous way of doing things of "government issuing many orders without any coordination," and to put a further stop to various evil tendencies to assure stability of market prices, the better to serve economic readjustment.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

ECONOMIST EXPLAINS FINANCIAL DEFICITS

HK250818 Shanghai SHIJIE JINGJI DAOBAO in Chinese No 55, 19 Oct 81 p 6

[Reply to reader's letter: "The Essential Differences Between Financial Deficits and Methods of Solving Them in China and in the Capitalist Countries"]

[Text] Ni Jingdong, a reader in the main factory of the Baoshan Iron and Steel Company asks: What are the essential differences between financial deficits and the methods of solving them in the capitalist countries? The amounts, in absolute terms, of the finanical deficits in Western capitalist countries are much larger than those in our country, while it seems that their economic situation is not as harsh as ours. Why is this?

We referred this question to Yuan Enzhen of the Institute of Financial Science under the Ministry of Finance and of the Economic Institute under the Shanghai Academy of Social Sciences, whose reply is as follows:

The basic concept of a financial deficit remains the same, regardless of what society we are talking about. However, when it comes to the cause of a financial deficit, this will vary greatly from one social system to another. In a capitalist soicety, financial deficits have their roots in the anarchical state of production and the frequent economic crises. Therefore, their existence is inevitable. A planned economy is a characteristic of socialist societies, and thus, the existence, in a socialist society, of financial deficits is not inevitable.

The financial deficits that our country have suffered from in recent years were the result of serious miscalculations in planning caused by "leftist" errors and were reflections, in state finances, of serious disproportions within the national economy.

Financial deficits in capitalist countries are both inevitable and also a means by which capitalists reconcile contradictions and ward off crises. They also form an important part of Keynesian economic theory. America has, since the time of President Roosevelt, been implementing long-term deficit financing in order to stimulate production and consumption, and economic recovery and development through increases in government expenditure. In the 35 years since the end of World War II, America has had 27 deficit budgets. Among the other capitalist countries, quite a few are also, at present, implementing deficit financing. Although deficit budgets do go some way toward alleviating capitalist economic contradictions and crises, they rely on the issuing of money which in turn causes monetary inflation and price rises, causing the broad laboring masses to suffer.

Can socialist countries rely on deficit budgets to "stimulate" the economy? Of course not. First, even in capitalist countries, deficit budgets are a last resort. Second, deficit budgets result in monetary inflation and price rises. Obviously, socialist countries can never adopt this financial policy as it harms the interests of the broad masses. Third, if deficit budgets are incapable of having a definite alleviating effect on contradictions and crises even in capitalist countries, they will, in socialist China, merely bring about a further increase in disproportions. This is because, in capitalist societies, overproduction is a characteristic of disproportions and crises and deficit budgets and increases in expenditure are favorable to the elimination of overproduction. Disproportions in our country manifest themselves largely in underproduction, so that the purchasing power of our society exceeds the amount of commodities in supply, and thus a financial deficit will only further sharpen the contradictions.

Generally speaking, financial deficits should not appear in a socialist society and deficit budgets are even more out of place. Even in the case of the financial deficits that occurred a few years ago, all we could do was reduce capital construction, readjust proportions, cut down expenses and develop production in an effort to balance revenue and expenditure. This is what we are doing today and, moreover, we have been extremely successful. Financial balance is a major prerequisite for the healthy development of the socialist economy.

HEILONGJIANG FINANCE DIRECTOR INTERVIEWED

SK120835 Harbin Heilongjiang Provincial Service in Mandarin 2200 GMT 11 Nov 81

[Excerpt] According to Heilongjiang Ribao, fostering a comprehensive financial ideology and correctly managing and utilizing funds not covered by the budget is a key link in enlivening finance work. This was noted by Comrade (Zhang Luopu), director of the Provincial Finance Department, to our reporter while discussing ways to earn, save and use money. After he analyzed our province's economic work and revenue and expenditures in the first 10 months of 1981, he said to our reporters: Owing to the reform of the economic management system and the financial system, the relationship of financial distributions has changed. Now the wealth of society, localities and the masses has increased, but state finances are still in a difficult situation. This new situation has created a favorable condition for developing financial work. However, to keep abreast of this new situation, financial departments should eliminate a simplistic point of view and establish a comprehensive ideology which will increase society's wealth. All the money of the central authorities, localities, departments and enterprises belongs to the state. The only difference is which unit these funds belong to while they are budgeted. It is a good thing that departments and enterprises have much money. This shows that the wealth of society as a whole has increased, and economic work has enlivened. This is a favorable condition in developing financial work.

However, in distributing this increased wealth, the state should get a larger share than departments and enterprises, and enterprises should get more than individuals. It is necessary to uphold the principle of providing advantages to the state, enterprises and individuals while giving most to the state.

He said: In developing financial work, we must abide by the general goal of enlivening the economy and promoting production. As we solve financial difficulties, the focus must be on promoting production. We should never rashly change our policies. We should not return to the old path. Increasing production and economizing will build wealth. We should promote production and raise economic results. Our province's industrial output value and the utilization of funds are lower than in other provinces and municipalities. In expanding our prodution, priority should be given to tapping our potential and converting to intensive management. Financial departments should concentrate on tapping the potential of existing enterprises and raising economic results to increase production through tapping potential, renovation and reform and increase incomes through better economic measures.

Now that the wealth of departments and enterprises has increased, their funds have scattered and state revenue has not increased accordingly, how can we ensure the development of the national economy? Comrade (Zhang Luopu) commented on provincial funds not covered by the budget. He said: Funds not covered by the budget account for twice as much money as funds within the budget and will be increased gradually. We should raise construction funds from money outside the budget, rationally manage and scientifically utilize funds not covered by the budget and bring the funds of departments and enterprises into line with the state plan to ease the financial pinch. This is an urgent and important task in developing our financial work under the new situation.

FINANCE AND BANKING

HIGHER SAVINGS DEPOSITS REPORTED IN SHANDONG CITIES, TOWNS

Jinan DAZHONG RIBAO in Chinese 1 Oct 81 p 2

[Article by Wang Jincheng [3769 6651 6135] and Wang Xiuying [3769 4423 5391]: "Savings Deposits in Cities and Towns of Our Province Increased by a Wide Margin--Savings Deposits in Cities Increased by 730 Million Yuan Since Third Plenary Session, With Higher Growth Rate Than in Previous 29 Years"]

[Text] Since the Third Plenary Session of the 11th CCP Central Committee, savings deposits in the cities and towns of our province have increased by a wide margin. In the two years and 10 months from 1979 to the middle of September this year, the total balance of savings deposits in these cities and towns increased by more than 730 million yuan. The rate of growth during this period exceeded that of the previous 29 years, from 1949 to 1978. Even within this year, the balance has been increased by 249 million yuan. By now, the total amount of savings deposits has reached 1.4 billion yuan. The state's savings deposits plan for this province was fulfilled 100 days ahead of schedule.

The large-scale increase in savings deposits shows the fairly great improvement of people's living conditions. Since the Third Plenary Session, the state has adopted a series of measures--such as readjustment of wages for some workers and the system ofrewards for enterprises and workers--to develop production and improve people's livelihood. The workers' income has continued to increase and their living conditions have continued to improve. This has served as a material foundation for the growth of people's savings deposits. By now, each worker has an average annual income of 275 yuan, or 134 yuan more than in 1978.

The large-scale increase in savings deposits also reflects the high prestige enjoyed by the Renminbi. The implementation of the policy of economic readjustment by enterprises has resulted in a vigorous development in the production of consumer goods of daily use and the increase of commodities in short supply. It has also helped in the large-scale withdrawal of currency, leaving a little more than enough for circulation. With the stability of commodity prices and peace of mind, many people have deposited their money in the bank. At present, the total amount of savings deposits in cities and towns accounts for one-fourth of the sources of funds for the People's Bank, and has become an important monetary force in support of production and construction.

FINANCE AND BANKING

BRIEFS

TIANJIN SAVING DEPOSITS--In the first 10 months, of this year, the Tianjin urban people's saving deposits reached over 818.8 million yuan and registered an increase of over 128 million yuan. Per household deposit was 940 yuan. According to statistics compiled by the Municipal Agricultural Bank at the end of October, peasants' saving deposits at various credit cooperatives reached 130,035,000 yuan. Their deposits during this period surpassed the figure of the corresponding 1980 period by over 45,944,000 yuan, or 55 percent. The deposit per rural household was 61.14 yuan, a 57.22 yuan increase over the corresponding 1980 period. [SK102253 Tianjin City Serivce in Mandarin 0030 GMT 10 Nov 81]

HUNAN FINANCIAL CIRCULAR--The Hunan Provincial Financial Bureau recently issued a circular demanding that financial and taxation bureaus in various prefectures and counties continue to check tax evasion and enforce financial discipline. The circular demanded that the following tasks be carried out: 1) sum up experience gained in launching previous inspections; 2) grasp the checking of key enterprises and deal with old and severe problems; 3) simultaneously grasp storage work and taxation work; 4) strictly control all kinds of expenditure and forbid indiscriminate distribution of bonuses. In conclusion, the circular demanded that leaders at all levels take the lead in checking tax evasion and economizing on expenses in order to do a good job in accomplishing the financial tasks. [Changsha Hunan Provincial Service in Mandarin 1100 GMT 5 Nov 81 HK]

NEI MONGGOL TAXES--By mid October, Nei Monggol region had collected 480 million yuan of industrial and commercial taxes, 84.32 percent of the annual plan--an increase of 6.87 percent over that of the corresponding 1980 period. Based on an investigation conducted between May and September, 34 million yuan of taxes has been evaded, and 18.53 million yuan has been collected. Taxes collected from light and textile departments amounted to 116 million yuan this year, 23.65 million yuan more than in the corresponding 1980 period. [SK301144 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 29 Oct 81]

YUNNAN PROVINCIAL REVENUE--From January to September this year, Yunnan Province fulfilled 87.5 percent of its quota for revenue for this year. The amount of revenue in this period was 16.5 percent more than in the corresponding period of last year. Seven prefectures and autonomous prefectures, including Yuxi, Chuxiong, Zhaotong, Baoshan, Dehong, Nujiang and Deqen, fulfilled or overfulfilled their quotas for revenue for this year 3 months ahead of schedule. [Kunming Yunnan Provincial Service in Mandarin 1100 GMT 15 Oct 81 HK]

GUIZHOU INDUSTRIAL, COMMERCIAL TAXES--From January to the end of September, Guizhou Provincial fulfilled 80.95 percent of the quotas for industrial and commercial taxes for this year, and the amount of taxes was 9.57 percent more than in the corresponding period of last year. In the province, Qiandongnan autonomous prefecture and 18 counties, including Jinping, Huangping, Congjiang, Jianhe, Rongjiang, Leishan, Leishan, Taijiang, Fuquan, Guiding, Libo, Kaiyang, Xifeng, Xiuwen, Meitan, Jinsha, Bijie, Qianxi and Puan, and 150 revenue offices and groups overfulfilled the quotas for industrial and commercial taxes for this year. [HK260803 Guiyang Guizhou Provincial Service in Mandarin 2315 GMT 8 Oct 81]

GUANGDONG REVENUE--From January to September this year, Guangdong Province fulfilled 80.06 percent of its revenue quota for this year. Its revenue was 13.33 percent higher than in the corresponding period last year which was an increase of 264.6 million yuan. By the end of September, Shenzhen, Zhuhai, Huidong, Nanxiong, Lianshan and 74 revenue departments had fulfilled their revenue quotas for this year ahead of schedule. The income from tax levied on sugar was 28.22 million yuan and that from tax levied on cigarettes was 11.8 million yuan more than in the same period of last year. [HK041527 Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 25 Oct 81]

CSO: 4006/125

BRIEFS

HEILONGJIANG GOLD OUTPUT--The Heihe Gold Mining Administrative Bureau, Heilongjiang Province, has overfulfilled its annual gold production plan. By 16 November, the bureau surpassed its annual plan by 227 liang. [Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 16 Nov 81 SK]

SHANDONG GOLD PRODUCTION--Gold production has developed steadily in Zhaoyuan County, Shandong Province. In the first 9 months of this year, the county produced 49,600 liang of gold, an increase of 2 percent over the corresponding 1980 period, and gained 4.769 million yuan of profits, an increase of 41.9 percent over the corresponding 1980 period. [Jinan Shandong Provincial Service in Mandarin 2300 GMT 22 Oct 81 SK]

RARE EARTH RESERVES--Beijing, 16 Nov (XINHUA)--China has 36 million tons of industrially workable rare earth reserves, ranking first of all countries in the world, according to a national conference on wider application of rare earths now being held in the Chinese capital. The reserves are calculated in terms of rare earth oxides. Minerals containing all the 17 kinds of known rare earth elements have been located in China, in 19 provinces and regions, including Nei Monggol, Jiangxi, Guangdong and Hunan. The content of europium oxide and samarium oxide found in Ores in Baiyunebo near Baotou City in Nei Monggol proves to be fairly high. The content of yttrium oxide found in rare earth oxides in Jiangxi Province is as high as 50 to 60 percent. China's annual production capacity of rare earths ranks second in the world, next only to that of the United States. The exports of rare earth products this year are expected to be 50 times that of 1978. Key rare earth extraction and smelting enterprises set up in China include the Baotou Iron and Steel Company, the Shanghai Yaolong Chemical Plant and the No 1 Smelting Plant of Gansu Province. [Beijing XINHUA in English 1251 GMT 16 Nov 81 OW]

CSO: 4020/30

COUNTRY REPORTED PRODUCING MORE, BETTER PHARMACEUTICALS

OW191125 Beijing XINHUA Domestic Service in Chinese 0735 GMT 19 Nov 81

[Excerpts] Beijing, 19 Nov (XINHUA)--XINHUA reporters learned from the national discussion meeting of pharmaceutical administration directors that the chaotic situation in pharmaceutical production caused by the 10 calamitous years has basically altered. The total output value of the country's pharmaceutical industry from January through October this year increased by 12.3 percent over the same period last year; total sales of traditional Chinese and Western medicines and medical apparatus and instruments increased by 7.4 percent over the same period; and the composition of pharmaceutical commodities in stock has been rationalized.

Since the State Council issued the "Decision on Strengthening Pharmaceutical Administration," the people's governments of Shanxi, Sichuan, Ningxia, Nei Monggol, Henan, Liaoning, Guangxi, Yunna, Jiangxi, Hunan, Gansu and Anhui provinces and autonomous regions have issued special circulars, and other provinces, municipalities and autonomous regions have also done a lot of work in implementing the "Decision," working out relevant regulations or adopting various specific plans and measures.

In accordance with the guidelines of the "Decision," localities have reorganized pharmaceutical enterprises; 447 below-standard pharmaceutical plants have been closed down, have ceased production, been integrated with other enterprises or converted to producing other products; and a number of illegal units producing and selling false or inferior medicines have been tracked down.

To guarantee and upgrade product quality, localities have, in accordance wih the demands of the "Decision," initially improved quality control organizations at various levels, established testing and inspection systems and product quality standards and given comprehensive quality control training to more than 200,000 workers and staff members. As a result, the quality of pharmaceutical products is being gradually upgraded.

CSO: 4006/132

READJUSTING, RESTRUCTURING OF MACHINE-BUILDING INDUSTRY VIEWED

HK231525 Beijing JINGJI YANJIU [ECONOMIC RESEARCH] in Chinese No 10, 20 Oct 81 pp 22-27, 61

[Article by Fan Muhan [5400 1970 7281]: "A Discussion on the Present Task of Readjusting and Restructuring the Machine-Building Industry"]

[Text] The machine-building industry is one of the focal points for readjustment of the national economy. It supplies technological production equipment, means of consumption and instruments for scientific research for economic development and people's livelihood. It also accounts for quite a large portion of the capital construction investments. Consequently, the readjustment of the machine-building industry constitutes an important link in the implementation of the readjustment of the national economy as a whole. The results of each readjustment will have a notable impact on the readjustment of the national economy as a whole.

The task of readjustment of the machine-building industry is determined by the task of readjustment of the national economy. Generally speaking, during the period of national economic readjustment the machine-building industry undergoes readjustment in three aspects.

First, Readjustment of the Service Orientation of the Machine-Building Industry

First of all, it is very obvious that the most conspicuous change in national economic planning during the period of readjustment is the adjusting of the proportions of consumption and accumulation, the proportion of accumulation being reduced to less than 30 percent of the national income. As a consequence of this change in proportions, the scale of capital construction has been curtailed, and investment in such construction has been reduced to about 30 billion yuan. At the same time, defense and administrative expenses have been cut, as has the purchasing power of the institutions experiencing cuts. This has had a direct impact on the product make-up of the machine-building industry, which needs readjustment correspondingly, because the need for its products for expanded reproduction and military equipment has been reduced, with about half of its existing capacity left idle. On the other hand, as prices of farm products have been raised, which in turn increases the wages and the cost of living subsidies and greatly enhances purchasing power, the markets have suffered from shortages. For this reason, it has become an important task to mobilize and divert the production capacity of the machine-building industry to the market economy by producing more daily-use electrical and mechanical products.

Of course, it should be said that the production of daily-use electrical and mechanical products is a part of the machinery industry. However, due to the fact that the machinery industry was regarded in the past simply as an industry for the production of the means of production alone, supplying technological production equipment to the various sectors of the national economy, the task of producing the means of consumption has been excluded from this industry. Consequently, the production of daily-use electrical and mechanical products has been left to the light industry sector. This has led to the setting up of special factories by the light industry sector for the production of these products, which could have been produced by the numerous enterprises of the machinery industry. This is the reason why the growth rate of this part of the consumer goods sector has been so greatly retarded, giving rise to the shortage of supplies in the markets over the years. Our people's republic was founded 30 years ago, and yet a peasant or a city worker (either a factory or an office worker) has to produce a coupon to buy a bicycle. This is a good indication of the extent of the shortages. Therefore, the orientation of the machinery industry should be readjusted so that it will undertake the task of producing daily-use electrical and mechanical products and restore one of its original functions.

The second thing to do is to expand exports and open up markets abroad. Over the past 30 years, the machine-building industry has generally been providing services to the domestic market. We did have some foreign aid programs as well as a certain amount of machinery exports, but these constituted only about 2 percent of the total value of our exports. This percentage is of course far too low. In the long run, in order to realize modernization we must increase our exports by degrees. In this way, advanced technologies and the needed raw materials and implements can be imported with the foreign exchange earned. Relying simply on exporting agricultural products, agricultural household sideline products, mineral and handicraft articles will not be sufficient. The proportion of machinery products in exports must also be increased. This constitutes a formidable and strategic task for the machine-building industry of our country, namely the necessity for increasing exports and the alteration of the composition of our export products. In this case, is the machine-building industry of our country qualified for such a task? The answer is in the affirmative. In the first place, with the experience of more than 30 years of construction work, the machine-building industry has not only laid a solid foundation in terms of material requirements but has also trained a strong contingent of technicians. It is capable of producing products equal in quality to those of the 1960's and 1970's. In the second place, during the years of high accumulation rate in our country, investments in capital construction were relatively large, and the task of supplying equipment was a difficult one, leaving little room for exporting machinery products. In the case of the readjustment period, inasmuch as there is insufficient demand in the domestic market, it is feasible to organize a considerable amount of production capacity to supply goods for export. For a quite long time in the past, as we adopted the closed-door policy, little thought was given to the task of exporting machinery products so as to get a larger share of the international market, and there was even a lack of knowledgeability about international conditions and trends. As a result, technology exchange was very much limited. For this reason, the expansion of the electrical machinery export trade of our country is a formidable test for the technical standards of our machine-building industry as well as an effective stimulus for the industry.

The third thing to do is to undertake technological reform in industry and communications. In the past 30 years, it was not the first 5-year plan alone which witnessed the construction of a large number of large-scale projects for the purpose of developing industry and communications. New projects were also undertaken to expand the reproduction capacity in the subsequent 5-year plans. This is what Marx called the extension method of expanding the reproduction capacity. In the readjustment period, there will still be new capital construction projects, such as the development of new coal mines and oil fields. However, as far as the industry as a whole is concerned, the emphasis will be shifted to the technological reform of the existing enterprises. The reason is that more than half of our industries were constructed in the 1950's, both the technology and production equipment of which are backward and are due for renewal and replacement. Moreover, a considerable number of medium- and small-sized enterprises were constructed under the guideline of combining the indigenous and foreign methods, requiring comparatively little investment and equipped with simple and crude installations. Therefore, in the process of production there have been consistently poor efficiency, excessive consumption (energy in particular), poor economic results and great financial losses in these enterprises. Technological reforms must be undertaken in a planned way step-by-step in order to change their backwardness. With the completion of the technological transformation, the existing enterprises will not only be able to reduce consumption and enhance efficiency but also expand their reproduction capacity in general. This is called the intension method with regard to the new construction projects. The adoption of the intension method in the technological transformation of the existing enterprises naturally elicits extensive requirements for the machine-building industry: the supply of assembly lines and whole sets of equipment commensurate with a certain level of production technology, the replacement of certain individual pieces of equipment by more efficient and new equipment in accordance with production requirements, or the conversion of central control and command centers for production processes as required by production and so on. It is no easy task to accomplish this in comparison with equipping a newly constructed enterprise with complete sets of installations. Involved in this is a tremendous amount of research and designing, a large number of engineering technicians and studies and the formulation of the most economical program to achieve this technological transformation. When all these are done, we can proceed with the supply of suitable sets of equipment.

The fourth thing to do is to strengthen scientific research (including advanced military equipment) and to supply the necessary means for research and instruments for measuring and testing. Perhaps this is no new task for the machine-building industry, but it is a formidable task. It should be realized that our electronics technology and various instruments and meters do comprise a weak link. In comparison with the internationally advanced standard, this weak link represents an important aspect of the discrepancy existing in our electrical machinery products. Without new efforts in this field, it is impossible to improve the up-to-date nature of product composition or to guarantee the realiability and stability of product quality. Without these, it would be impossible to continue the improvement and supply of new products of an advanced nature and good quality and to make our machinery products competitive in the international market. Of course, in addition to these, we should also see the importance of the means of research provided by the machine-building industry. In the modern era, no scientific experiments can be conducted with only a few pieces of simple experimental tools. More often than not, only a whole set of complicated experimental equipment is required. At present, without the help of mechanical instruments (including electronics instruments) and repeated experiments, no achievement in the field of applied sciences can be realized. Therefore, in the process of readjustment the machine-building industry of our country must, in compliance with the requirements for improving scientific research, provide timely supply of means for doing research and instruments for measuring and testing so that we can reap fruitful results in the field of applied science.

Second, Readjustment of the Production Organization (Including Labor Organization) of the Machine-Building Industry, or the Transformation of the Existing Enterprises According to Specialization

At the very beginning of the first 5-year plan, attention was paid to the principle of specialization in production regarding the construction and development of the machine-building industry. This meant the adoption of specialized production as the form of production organization in relation to the specified production target of a machine-building plant, or the specification of the products to be produced by this plant (whether to use assembled products or parts and which specific parts to use) and the necessary technology required for fulfilling the given production task. Unfortunately, in the past 30 years we did not do well in following this principle, and we caught the common disease of taking the road of "all-purpose production" either consciously or unconsciously. Many factories turned out to be the often-mentioned "small but complete" and "large and complete" factories.

This all-purpose production organization causes difficulties in our work on all fronts and losses with respect to economic efficiency.

(1) It ties up an undue amount of state investment, causing duplicate equipment to be idle. The spare parts and technological cooperation that could have been available in the society were used or undertaken repetitively in the all-purpose production factories, resulting in a low utilization rate for the equipment and low output value per 10,000 yuan of the total fixed assets. In spite of the fact that we do not yet have precise statistics, estimates from sample investigations tell us that even if we assume one work shift a day the utilization rate of equipment is only about 50 percent.

(2) It makes the remodeling and redesigning of the product quite difficult. In the large all-purpose factories, practically all of the spare parts are made by the factories themselves. Consequently, more often than not the improvement of product structure as well as the production of new products has to be achieved in the workshops of the factories themselves, giving rise to much difficulty and taking a long time. This is one important reason why the improvement of products cannot be carried out frequently nor the remodeling and redesigning of the products.

(3) It is difficult to raise the level of production management as well as that of technological management. The reason is that in a factory, even if both the factory director and the chief engineer are very talented economists and technicians, very often it is impossible for them to guarantee product quality and to improve economic efficiency in the process of the manufacture of so many spare parts and in technological processing.

Very obviously, these three reasons account for the defects of the all-purpose production organization. They are also the main causes for the slow pace in the development of the machine-building industry of our country in terms of the economics of technology and insignificant achievements. Since this situation is already known to us, we must make efforts to improve it. Its existence and continuation should not be allowed. Yet, why is that problems which were singled out for attention during the first 5-year plan have been left dangling without a solution? A serious discussion on this matter is imperative.

First of all, in theory we denied that the means of production under the socialist system could be commodities; hence the denial of the machine-building industry's right to allocate the electrical machinery products that it produces. The production and circulation process of these products were to be realized through state planning. Thus the enterprises became purely processing factories without having to know who the customers were and what comments they made. In other words, economic methods were totally replaced by administrative methods in the form of state intervention.

It is exactly for this reason that the existing system, procedures and methods of planning and management have taken shape. Such a highly centralized management method is bound to lead to rigidity and triviality. To a certain extent it restricts rather than promotes the development and improvement of the machine-building industry itself as well as the services rendered by this industry to the society in all respects. Let us take an example to demonstrate the harmfulness involved. Let us assume that enterprise A and enterprise B belong to the same local community. A's products have to be matched with those of B to form complete sets of products. However, due to the fact that A cannot approach B to place its order directly, nor does B have the right to dispose of its own products, both A and B have to go to the authority concerned with their respective production plans in hand to apply for permission to proceed with the plan and to secure production targets. The next step is to go to the distribution authority of the state to hand in their plan application in order to get the allotment directive. Finally, A gets from B what it needs to make complete sets of products. The leading authorities of the state did repeatedly mention that cooperative relations should be established, but they could find no new solutions. To finalize, one has to wait for the contract conference to bring the buyers and sellers together. Because machine-building factories, regardless of what they produce (or what technological processing they engage in), are without exception the basic-level units under the control of state planning, and because all economic activities of the factories have to be listed in the state plans, projects listed in the state plans cannot secure whole sets of equipment on the agreed delivery date, thus prolonging the construction cycle. In addition, enterprises under the state plans cannot fulfill their production targets because of failure to get the needed products to match what they produce to form complete sets of products. This again encourages those who are in charge of these enterprises to undertake production in their own enterprises, as very often they can find no one to cooperate with them. There were two upsurges in the history of the development of the machine-building industry of our country: one in the "great leap forward" year of 1958 and another in 1969, year of the "Great Cultural Revolution." Both of the upsurges occurred in periods when the state had no economic contract statute, when production cooperation among enterprises was to be arranged by the leading authorities and was frequently interrupted, and when there was no sure supply of complete sets of products.

Also note worthy is the fact that the tax structure adopted by the state is unfavorable to specialized production by the machine-building industry. The same tax rate is levied on products made for the purpose of forming complete sets of products, whether they are for social sales (for maintenance, export etc.) or whether they are meant to be used in the course of producing end products. This causes the prices of such products to be on the high and does not demonstrate the superiority of specialized production. The higher the degree of specialization found in the main engine factory (the general assembly factory), the higher the prices of its final production. On account of this economic factor relating to state tax plicy, very often the main engine plants are encouraged to stop their cooperative relations and take up the production themselves. Apart from spare parts, the production of semi-finished products are notable in this respect, as every factory has its own iron casting, steel casting, forging, and other surface treatment workshops, giving rise to superfluous and duplicative production.

Furthermore, subjectively, the thinking of small handicraft industry very often still persists, which is a hindrance to the popularization and maintenance of specialized production. As this kind of thinking has no place in the organization and management of large-scale production and always strives to finish more work in relation to a product within the confines of its own enterprise, and aided by various objective reasons and the lack of guarantee for cooperation, people are made to think that it is better to have fewer cooperative connections and safer to produce within the confines of their own factory.

In short, the all-purpose production organization yields poor economic results--a low utilization rate of equipment in particular--which gives rise to a considerable portion of the fixed assets being left idle. This situation must be changed as soon as possible through resolute readjustment.

Third, Readjustment in Regard to the Allocation of Productive Forces

There were two adjustments of the geographical distribution of the machine-building industry in history. The first one was during the first 5-year plan with the location of some of the important machine-building projects in the interior of our country. The second one was made during the third 5-year plan, during which the guideline of carrying out construction on three fronts was formulated. According to this guideline, many projects were added to produce parts for making complete sets and to carry out cooperation, with the previously constructed major machine-building projects as centers. By and large, construction projects were undertaken to provide the interior of our country with independent industrial bases. These heavy industry bases, the result of great efforts of construction since the founding of the people's republic, do make their own contributions with respect to strengthening our national defense and developing our heavy industry. The fact that what is produced along the seacoasts can also be produced in the interior of our country is in itself an achievementin ameliorating industrial production distribution. Unfortunately, due to Lin Biao's interferences the principle of overall dispersal and localized concentration was discarded. At the same time, no consideration was given to the various conditions of industrial construction. Instead a very harmful policy of building small factories "in mountainous areas, in scattered places and in caves" was implemented, causing great economic losses and numerous difficulties to production activities in the following years. While we criticize the crimes committed by Lin Biao, positive policies should be adopted to readjust the projects on the three construction fronts step-by-step so as to improve and consolidate them and to revive the economic viability of our inland industry which possesses superb cadres and workers and the best of equipment.

Of course, in regard to the allocation of productive forces, attention should also be paid to the development of light industries in the interior of our country, a shortcoming of the past to be overcome. It is common knowledge that industries are more advanced along the seacoasts in our country, and their products are of better quality. In spite of the impracticality of the simple proposition of getting the interior light industries to catch up with the well-known brand-name products produced in the coastal areas in a short period of time, consideration has to be given to the problem of transportation. In other words, it is undesirable to devote all our efforts to persistently develop the light industries of the coastal areas and then organize sales to the interior part in immense quantities. This may likewise give rise to new economic irrationality due to lack of careful thinking and to poor distribution.

Are the conditions of the interior of our country adequate for the development of the machine-building industry? Insofar as the electrical machinery products are concerned, raw materials are available for local supply. If products can also be marketed locally, it should be said that this is rational economically. Therefore, at least a positive response should be given in making our plans, if production of suitable products is organized in accordance with the requirements of the interior markets. Special attention should be paid to the planning of production of daily-use electrical and mechanical products. Factories should be made to produce the parts in accordance with the principle of specialized production, and utilization should be made mainly of the existing technology (similar technology) of the enterprises. Finally, the general assembly work should also be carried out among the existing enterprises. No emphasis should be given to setting up new specialized plants. In this way, savings can be made in state investments as well as in time, while full play can be given to the production capacity of the existing enterprises in the production of more daily-use electrical and mechanical products. In the interior of our country, such machine-building enterprises are quite large in number. To organize them and divert their production to daily-use electrical and mechanical products is not only in conformity with the guideline in readjusting the machine-building industry but is also a main aspect of the current readjustment of the allocation of productive forces.

The above-mentioned three readjustments of the machine-building industry are related. Overall consideration should be given in the process of readjustment in order to get better results. Meanwhile, it should also be noted that the task of readjusting the machine-building industry is closely related to that of the readjustment of the national economy as a whole. Consequently, every part of its readjustment must accurately manifest the requirements of the readjustment of the national economy.

The task of readjustment of the machine-building industry is a strenuous one. It may take several years, perhaps even a longer period of time. The accomplishment of these readjustment tasks are inseparable from the necessary reforms of the machine-building industry. In other words, readjustment and the necessary reforms must be concurrent. It is inconceivable to undertake readjustment in the first

5 years and then carry out reforms in the next 5 years. Readjustment and reform are complementary. When we say that reform is subordinate to readjustment, while readjustment stimulates reform, we mean to avoid overanxiousness in carrying out reforms. It is unrealistic and impractical to attempt overall reform and implement it at present. However, we must also realize that amidst readjustment there must be the necessary reforms, without which the task of readjustment cannot be carried out. Let us look into the reforms that must be carried out during the readjustment period.

First, the Reform of the Management of the Machine-Building Industry

The industrial management system being practiced in our country exercises its control over the enterprises by trades (departments) and geographical districts. Our country has over 400,000 enterprises, which are classified into various categories and divisions and are under the jurisdiction of 40-odd departments as well as the administrative organs of the 29 provinces and municipalities. Despite the fact that the enterprises are in principle the state's economic units at the basic level and have an independent economic accounting system, without exception, the government organs of all levels may intervene in their economic activities. In this respect they are not actually independently operated units. In fact, the enterprises do not have the right to operate independently with respect to their production activities. The actual operational authority is in the hands of the government organs which are in charge of the enterprises. The enterprises do no more than fulfill the tasks assigned by the government organs according to a schedule just as factories do in manufacturing goods by order. Inasmuch as these enterprises do not have opertional authority in the process of socialized production and circulation, they can in no way assume any responsibility in respect to their economic activities. Those in charge of the enterprises assume responsibility only for administration (fulfilling tasks according to schedule) and nothing in regard to operations.

The divorce of production from circulation and of the administration from operations of the enterprises imposes very serious passive effects on the industrial economic activities of our country. A system comprising a whole set of purely administrative methods in control of industrial activities has been formulated. In order to manage such a large number of industrial enterprises many organs have been set up, and a large number of personnel have been employed. What is more serious is that the procedures are cumbersome and numerous, the administrative elements overlap, and efficiency is low. This of course does not fit the requirements of socialized large production. From the standpoint of operations and management, the industrial productive forces are held back. The economic efficiency of the fixed assets of our industry is so low mainly because the shortcomings of our existing industrial management system.

The question of enterprise autonomy has already been brought up in the readjustment period. In brief, autonomy means independent operational authority and actually being the economic units of the state at the basic level. In this way, through painstaking operations and management the enterprises give full play to their roles, satisfy the needs of society and create more accumulation for the state. This reform is bound to be implemented, and only by carrying out this reform can we realize the goal which we have been discussing for years, namely to manage our industry by economic methods.

In the management of the machine-building industry, there is another urgent problem, namely getting rid of the barriers between departments and geographical regions so that national planning and arrangements may be made for the production activities of the machine-building industry.

Strictly speaking, the development of the machine-building industry of our country started only after liberation of the whole country. Before liberation, there were only a few repair and spare parts factories. During the past 30 years, there have been two important changes in the development of the management system. The first change occurred in the period of the "great leap forward," when the guideline of giving play to two initiatives was formulated. It was emphasized that enterprises were to be the concern of the lower-level authorities; the various departments of the central government should take no charge of, or less charge of, the affairs of the enterprises and leave them to the care of the provinces (or municipalities) to which the enterprises belonged. However, as the implementation of the guideline was enforced, it was not the provinces (or municipalities) alone which shared the management of the enterprises with the central government, but the prefectures and smaller municipalities also shared with the provinces (or municipalities), and the counties and districts shared with the perfectures and smaller municipalities. This was the first major decentralization of management of the machine-building industry. The outcome of this was that the various departments of the central government, the provinces (or municipalities), the prefectures, the smaller municipalities, the counties and the districts all have their own machine-building industries. As the machine-building industry is basically a horizontal industry--every mechanical and electrical product requires extensive cooperation among many enterprises in order to finalize the assembling of the end product--eventually, this leads to the situation of mediocrity in the industry as a whole. Numerous enterprises undertaking duplicate production were constructed as enterprises strived to produce complete sets of equipment, leaving the rectification of the administrative management of the machine-building industry untouched. The result was excessive decentralization. The result was excessive decentralization. The second change occurred during the latter part of the cultural revolution. The dual system of the machine-building industry was emphasized under the guideline of giving play to two incentives. In this system, the machine-building industry was responsible for the production of general machinery, while the production of the special purpose machinery was left to the respective government ministries. For example, coal machinery was to be produced by the Ministry of Coal Industry, oil-producing equipment by the Ministry of Petroleum Industry, to the point that large construction machinery was produced by the various construction departments and fire-fighting equipment was produced by the Ministry of Public Security. What resulted from this was another case of excessive decentralization, giving rise to even more serious duplication and waste, and causing many enterprises to operate below capacity year-round with their fixed assets left seriously idle. This is a kind of blind order due to lack of knowledge and of realization that while different machines for different uses have different requirements, they, including electronic equipment have much in common structually and technologically. The result of this can only be excessive dispersal of the limited funds at the disposal of the state and the rise of numerous duplicative enterprises. A typical example of this is our automobile industry. The annual volume of this industry is very small, but there are as many as 100-odd automobile plants. We must change this situation. It is imperative that the management system of the machine-building industry be reformed during the readjustment period. Otherwise, under the limitation of the departmental and local ownership systems, it will be impossible to carry out effective readjustment of the machine-building industry on a nationwide basis.

At the very beginning of the economic readjustment period, the state machine-building industry commission was set up by the State Council. In theory, it appears that one more unit is added to the hierarchy of government organization, but this is quite necessary for the adjustment and reform of the machine-building industry. The reason is that only through such an organization can the productive capacity of the machine-building industry of the various departments and districts be brought under unified control so that overall planning and arrangements can be made and the task of readjustment be effectively achieved.

Second, Reform of the Organizational Structure of the Machine-Building Industry

The development of the machine-building industry has brought into being a strong base comprising approximately 100,000 enterprises with 12 million staff and workers and more than 2 million machine tools. Of these enterprises, only 6,000-odd enterprises are large and medium-sized, but all of them are economic units of the state as well as the planning units of the state at the basic level. This poses a problem for the state in planning and management, because the services covered by the machine-building industry are very extensive and the production of a product requires much cooperation among the enterprises. This is the reason why the State Council has indicated that the road of unification should be taken whereby the related enterprises can be organized into corporations (also called integrated enterprises) in accordance with internal relationships. These corporations are economic units as well as the planning units of the state at the basic level. Being able to unify the process of production and distribution, they become independent legal persons, not only beneficial to the planning and management of the state, but also to the enlivening of the initiative of the enterprises. This changes their status as appendages of government organs. Instead, they become independently operated economic groups.

The Shanghai Shipbuilding Corporation has already been set up in the readjustment period as an organization embracing the shipyards and plants producing parts to fill the gaps in completing sets of equipments in the neighboring areas of the district, so that the restrictions resulting from barriers between departments and districts can be removed and independent operations ensured. This is the practical road for the machine-building industry to take in readjusting the organization and structure of the enterprises involved.

Here it can be seen that without the reform of the management system of the machine-building industry it would be impossible to break through the barriers between the departments and districts in order to carry out reforms of the organization and structure of the enterprises. Again, without carrying out such a reform, the tasks concerning product composition (service orientation) and production organization (specialization) will not be successfully accomplished. Of course, aside from the reform of management system, there are also certain auxiliary reforms regarding management and methodology, which are also very important. These should be treated in another article, as the machine-building industry during the readjustment period and to demonstrate the necessity of concurrently carrying out certain reforms. Concerning the relationship between readjustment and reform, while this relationship can be summarized by the statement that reform is subordinate to readjustment and stimulates readjustment, it should be added that readjustment and the necessary reforms must be carried out concurrently and that reform must be carried out in accordance with the requirements of readjustment.

In the process of reform, great resistance to reforming the management system, has been evident. It is true that the enterprises are entities under whole-people ownership system with the relationship of subordination originating from authority being delegated by the state to the government organs concerned. Therefore, there should not be obstacles to the reform of the management system under the socialist system, since there is only one criterion for making reforms namely the reform must be stimulative and conducive to the development of productive forces. Basically the life and death struggle under the capitalist system no longer exists. Yet, we should not underestimate the influence of private ownership over the past several thousand years over people's mind. Such a mentality very often inherits the ideology of the small producers, which admires and seeks the rosy prospects of self-sufficiency, always longing for an independent setup despite its unfavorable effect on socialist large-scale industry. In such a frame of mind, one would feel a sense of loss at the very mention of reform and would always look for reasons to defend the old system. All these are reasons for the resistance to reform, which should not be taken lightly. One interpretation puts readjustment first and reform second. This is a wrong formulation. Setting the two apart as being totally unrelated is actually an appeasement to the resistance against reform. We should persist in the guideline formulated by the 3d plenary session of the 11th CCP Central Committee, namely to carry out readjustment, restructuring, reorganization and upgrading in the national economy. The machine-building industry should implement this eight-character policy in an all-round way. We should first have a thorough discussion to make clear the overall readjustment task of the machine-building industry, and then studies should also be made with regard to reform. The two must be carried out simultaneously so that the successful accomplishment of the readjustment tasks can be guaranteed and accelerated.

INDUSTRY

BRIEFS

SICHUAN METALLURGICAL INDUSTRY BOOSTED--Since last July the metallurgical production has been developing well and the monthly total output value exceeded 200 million yuan in 3 months successively from July to September. By the end of September, 83 percent of the planned output value had been fulfilled and it has been forecast that the quota will be overfulfilled by 9 percent. DOMESTIC TRADE

FUJIAN HOLDS FINANCE, TRADE CONFERENCE

OW170615 Fuzhou Fujian Provincial Service in Mandarin 1120 GMT 16 Nov 81

[Text] The recent provincial conference on finance and trade work called on the commercial supply and marketing departments at all levels to strengthen their leadership and make good arrangements for rural markets, which serve 85 percent of the population. The conference held by the Fujian Provincial People's Government specifically studied how to clear the channels for commodity circulation in order to facilitate the supply of industrial products to rural areas.

The conference demanded: It is necessary to continue the principle of two priorities. In the supply of those industrial products which both urban and rural areas need, priority should be given to rural areas. Commodities in general should be supplied to rural areas on a priority basis to satisfy the needs of the rural market. We should strive to sell more commodities in rural areas in order to withdraw more currency from circulation. Eighty percent of the increased portion of the annual output of the commodities which are in short supply, such as bicycles and sewing machines, should go to the rural areas, and 20 percent should be sold in urban areas. The deficit in commodity supply to rural areas for the first 9 months of this year should be made up. Unhealthy tendencies such as unauthorized retention or distribution of commodities and "opening the back door" must be resolutely stopped. We should make sure that the commodities are supplied to the peasants. A portion of the commodities in short supply should be set aside to reward the collectives and peasants making great contributions through the sale more agricultural and sideline products.

The conference also demanded: The wholesale commercial enterprises should support and direct the supply and marketing cooperatives to promote sales of industrial products. They should open their stock and give the supply and marketing cooperatives a choice, rather than compel the cooperatives to buy a certain percent of unmarketable goods as a condition for the deal. The supply and marketing cooperatives should improve the sale of industrial products for daily use, prevent the tendency of paying more attention to major commodities and less attention to small goods and increase the variety of goods on sale as much as possible. The agricultural banks at all levels should extend loans to support the supply and marketing cooperatives if they are short of capital. The commercial supply and marketing departments should hold commodity fairs of various forms to make the supply of industrial products to rural areas more active. At the same time they should ask licensed pedlars to sell goods in the countryside. Commodities sold by the industrial department itself should also be geared to the need of the rural areas.

The conference, which closed today, also urged the county and municipal people's governments to set specific requirements for the supply and marketing cooperatives to sell the building material the rural areas urgently need, such as cement, rolled steel and glass, in order to satisfy the needs of the rural areas.

BRIEFS

TIANJIN COMMENTARY: ILLEGAL MARKET ACTIVITIES--According to departments concerned, there have recently been lawless persons around farm and sideline produce markets and stations frequently forcing farmers to sell their farm and sideline produce at lower prices and then reselling the goods at higher prices. This is illegal and rude. There have also been a few individually-owned stores violating regulations on food sanitation to sell unsanitary foods. This must not be tolerated. We must resolutely stop this and strengthen the management of markets. We must understand that forcing farmers to sell their goods at lower prices and reselling the goods at higher prices is illegal. They have nothing to do with the transportation links needed by farmers after they deliver their goods to urban areas. They are not only harmful to the markets but also directly impinge on farmers' and consumers' interests. We must deal with such activities according to law to protect legal deals and consumer interests. Food sanitation has a vital bearing on the people's health. Foods must be produced and sold in strict accordance with the regulations for food sanitation. Any violation of these regulations is considered illegal. Therefore, we must check these illegal activities and punish those who have bad consequences to safeguard the order of markets and protect the people's health. [Station commentary: "Strengthen Market Management, Protect Legal Deals and Attack Illegal Activities"] [Text] [SK130908 Tianjin City Service in Mandarin 1430 GMT 12 Nov 81]

SHANDONG MARKET PAPER--In order to expand reports on market activities, the propaganda department of the Shandong Provincial CCP Committee recently approved the renaming of Luwu Shichang Bao [Luwu market paper] as Shandong Shichang Bao [Shandong market paper], effective 1 January 1982. The paper will carry reports on market trends, Shandong's products, landscapes in Shandong, information on commodities, etc. Subscriptions for the paper can be made through post offices througout the country. [SK050138 Jinan Shandong Provincial Service in Mandarin 2300 GMT 2 Nov 81]

NEI MONGGOL ABSORBS SHANGHAI INVESTMENT--At the North China economic and technological cooperation conference held in Hohhot not long ago, the Nei Monggol autonomous region made a package deal with Shanghai municipality on economic and technological cooperation. Shanghai has invested 10 million yuan on highway construction in forest areas and comprehensive utilization of timber. The region will recompense Shanghai with timber and timber products. Shanghai also promised to offer bicycle electroplating and lacquering techniques and help the region develop production of quality candies, cold drinks and meat products. [SK192244 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 16 Nov 81]

JILIN UNDERGROUND MARKET--An underground market, the first of its kind in Changchun, Jilin Province, has opened business on 24 October. This market is 1,600 meters long and 6.4 meters wide and 24 state-, and collective-and individual-run units, including two department stores, are doing business there. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 24 Oct 81 SK]

PRICE RISE RUMOR DENIED--According to our sources, a rumor has recently been spread in society that the market prices of sugar, wool fabric, cotton cloth, coal and matches will be raised. Thus, many people are vying with each other to purchase such commodities. In this regard, Comrade (Liu Bixian), director of the provincial commercial department, has said in an interview with our reporter: it is still our principle to stabilize the prices of goods proceeding from the overall situation of stability and unity and taking into account the interests of the state, collectives and the masses. Sugar, wool fabric, cotton cloth, coal and matches are daily necessities of the people and, therefore, the prices of such goods must be stabilized. It is merely a rumor that there will be price rises for such goods. For the past many years, the state has adopted a policy of price subsidies for daily necessities such as coal, vegetables and meat. The vegetable and meat subsidies alone granted to the people by our province total 26 million yuan each year. In future, the state will continue to adopt a policy of subsidies to stabilize the prices of daily necessities. Departments concerned should extensively propagate and explain to the people the pricing policy of the party and government, and the masses should not believe and spread such rumors. CONFERENCE MAPS OUT FOREIGN TRADE STRATEGY

HK210142 Beijing CHINA DAILY in English 21 Nov 81 p 1

[Text] China must set up more factories and workshops devoted solely to the production of export commodities in order to expand her foreign trade, the national foreign trade planning conference says. This is part of a comprehensive strategy mapped out by the conference for development of foreign trade in 1982.

Other measures include:

--Expanding production of commodities which are in high demand on the world market.

--Improving salesmanship and eliminating red tape and bureaucracy.

--Strengthening management and cost accounting, and improving performance levels in fulfilling contracts.

--Carrying out reforms of the foreign trade system by implementing centralized guidelines, but allowing for some autonomy and initiative at lower levels.

Factories which produce export commodities should be located in coastal areas--the cities of Shanghai and Tianjin, and the provinces of Guangdong, Shandong, Liaoning and Jiangsu--because these regions are more advanced in industry, technology, management techniques, and communications facilities, the conference said.

These factories will mainly produce consumer goods and textiles. They will also process imported raw materials.

To meet the demands of the world market, agricultural and sideline product bases will also be established. For example, rabbit fur and pear export bases will be set up in the areas which produce these commodities.

It is estimated that in the next 4 years, the amount of purchases made at these bases and tories will increase an average 7.8 percent per year.

As an incentive, factories which produce high quality commodities will receive favored treatment in prices, taxes, and credits from the state. These products will also be given priority in export.

The conference said existing bases and factories which are devoted to export products should be further consolidated. Cold storage, processing, and transport facilities in these areas must be improved, the conference said.

The present emphasis should be on areas that raise pigs, oxen, ducks, rabbits, and martens for export, it said.

'FUJIAN RIBAO'ON BUILDING OF XIAMEN ECONOMIC ZONE

OW181413 Fuzhou FUJIAN RIBAO in Chinese 10 Nov 81 p 2

[Article by Chen Mingge: "Accelerate Construction of Ximen Special Economic Zone"]

[Excerpts] After a year's active preparations, the consturction Xiamen special economic zone has entered a new stage. This article contains my personal opinions of how to accelerate the special economic zone's construction.

Work started recently on the first-stage construction of the Huli processing district of the Xiamen special economic zone. To guarantee the speed and quality of the capital construction so that the special economic zone can provide the material conditions for businessmen to invest and build factories within a relatively short period of time. We must adopt new management procedures. Now that the overall plan has been submitted and approved, the question is whether it is possible to adopt a competitive, or open-bidding, system for plans on small sections and individual projects which can be designed separately. This method is obviously better than having the "sole organization" do all the planning. In organizing the construction forces, we also should consider combining state arrangement with open-bidding. With the designs and plans selected by the special economic zone, a number of building construction firms can be invited to submit bids, and contracts should be awarded firms offering the best terms.

While moving on with the capital construction in accordance with the overall plan, we must also study and formulate a plan for the special zone's economic development. It has now been clearly defined that Xiamen special economic zone should be built into a special zone which concentrates mainly on processing for export and at the same time attracts tourists and other trades. At present, we should develop mainly labor-intensive industries which cause little pollution and consume less water and power. Later on we should develop step by step technological-intensive industries. This consideration is based on our present conditions. We should also welcome businessmen to invest in electronics industry (including household electric appliances), light and textile industry, precision instruments and meters, clothing, leather products, toys, furniture, precision machinery, plastic products, jewelry, food industry, printing industry and so forth.

To insure smooth progress of the construction of the special economic zone, we must establish a highly efficient administrative organization for the special zone. Its structure must be simple; it must have sufficient powers; there must be fewer administrative levels; cadres must be small in number but highly trained; and there must be a clearly defined responsibility system to mete our rewards and punishments fairly and strictly.

DISCIPLINE INSPECTION COMMISSION ON KICKBACKS

OW102022 Hangzhou Zhejiang Provincial Service in Mandarin 1040 GMT 10 Nov 81

[Text] The discipline inspection commission of the Zhejiang Provincial CCP Committee recently issued a circular commending a number of comrades for observing discipline and saving foreign exchange during their study and business tours in foreign countries, Hong Kong and Macao. The circular also criticized a small number of comrades for their improper practices.

From last year to the end of April this year, departments under the Zhejiang Provincial Government dispatched 19 delegations consisting of over 100 persons to foreign countries, Hong Kong and Macao. The Provincial Discipline Inspection Commission, after investigating 14 of the 19 delegations, discovered that a delegation of the Silk Import-Export Company under the Zhejiang Provincial No 1 Light Industry Department, while on a visit to Japan, paid attention to saving transport and food expenses. Its cost of living only accounted for 39 percent of the amount stipulated by the state. A delegation of the Provincial Travel and Tourism Bureau and the China Travel and Tourism Bureau, while on an inspection tour in Hong Kong, strictly observed the central authorities' regulation prohibiting the acceptance and presentation of gifts. Comrades (Ding Siqi) and (Fen Zhufang), of the Zhejiang Provincial Publishing Bureau, spent most of the time in studies during their more than 1 month of technical training in Japan. They spent only half a day for sightseeing. In its circular the provincial discipline inspection commission commended these good people and good practices.

The circular also criticized the bad practices of a number of people who, while on inspection or business tours in foreign countries, tried to establish a relationship with foreigners, squandered foreign exchange to buy luxurious products and accepted kickbacks and gifts from foreign businessmen. They even tried to smuggle luxurious commodities into the country. In this connection, the circular made the following four stipulations:

1. The implementation of the central authorities' regulation on prohibiting the acceptance and presentation of gifts by anyone who is on inspection or business tours outside the country must be reemphasized. Gifts accepted after the issuance of the central authorities' relevant document must be reported to the general office of the provincial people's government for handling according to the regulation.

2. Establishing private relationships with foreign businessmen, presenting and accepting gifts in a concealed manner, accepting kickbacks from foreign businessmen and buying luxurious commodities are a disguised form of giving and accepting bribes. Gifts and kickbacks given by foreign businessmen must be turned in to the state.

3. Bringing commodities or products into the country without paying taxes is a disguised form of smuggling. Owners of these commodities or products must pay the tax.

4. The units to which the personnel who have violated customs regulations and discipline belong should conduct criticism and self-criticism. Disciplinary action should be taken against those whose cases are serious and who adopt a bad attitude toward their mistakes.

BRIEFS

SHANGHAI SHIPBUILDING INDUSTRY--Since last year, foreign firms have signed contracts with various shipyards in Shanghai for building 55 ships with a total tonnage of more than 500,000 dun. The total value of those contracts exceeds 400 million dollars. [OW271337 Shanghai Jiefang Ribao in Chinese 18 Oct 81 p 1]

FUJIAN FOREIGN TRADE--Fujian Province has transacted business with 124 foreign countries and places abroad. The total amount of this province's exports in 1980 was 47 percent more than in 1979. The total amount of exports from January to September this year was slightly more than in the corresponding period last year. Except for rice and granulated sugar which were not exported this year, the total amount of exports from January to September this year was actually about 10 percent more than in the same period of last year. This province's trade with Hong Kong, Macao, the United States, Japan, EEC, the Gulf petroleum-producing countries and Southeast Asia has thrived. The total amount of this province's exports to the United States in 1979 was some $7 million and in 1980 was some 21 million. Over the past 2 years, some 90 products of the province have been added to the list of exported products. The amount of light industrial and textile products, handicrafts and minerals exported has accounted for 75 percent of the total amount of exports. In the past, no textile products were exported but the amount of textile products exported in 1980 was valued at approximately $3 million. The amount of textile products exported from January to September this year was 65 percent more than in the corresponding period last year. [Beijing Zhongguo Xinwen She in Chinese 24 Oct 81 HK]

RARE EARTH EXPORTS INCREASED--Beijing, 19 November (XINHUA)--China this year has signed contracts with foreign dealers for exporting rare earths and rare earth products worth 16 million U.S. dollars, four times that of 1980, according to the national conference on wide application of rare earths which closed here today. Of the exported rare earths, the biggest export item is rare earth chlorides. Other include rare earth oxides, rare earth fluorides and rare earth concentrates. In recent years, China also has begun to export various kinds of color glassware, sanitary ceramics and glazed tiles, with rare earth content, rare earth-magnesium nodular iron castings, and opitcal lenses polished with rare earth polish powder. At the conference, participants discussed policies for developing China's rare earth industry and measures for the wide application of rare earth products. The conference decided to adopt new techniques and expand the export of rare earths and their products. [Text] [OW190904 Beijing XINHUA in English 0811 GMT 19 Nov 81]

SHANTOU PREFECTURE'S FOREIGN COUNTRACTS--Guangzhou, 19 Nov (XINHUA)--Shantou Prefecture in Guangdong Province has boosted its economy and expanded exports through imports of capital and equipment, and doing processing and assembling work for Hong Kong and foreign firms, according to prefecture authorities. Since 1979, they said, the prefecture has signed 1,248 contracts with Hong Kong and foreign firms. In the first 9 months of this year, income from these businesses was 10 million U.S. dollars, double the 1980 figure for the same period. Approximately 560 enterprises have been established using foreign investment and doing processing work for Hong Kong and overseas firms. They mainly cover the fields of garments, woollen knitwear, imitation leather, paper crafts and tourism. [Text] [OW190915 Beijing XINHUA in English 0738 GMT 19 Nov 81]

GUANGZHOU DUTIES ON COMMODITIES--To restrict the importing of commodities, such as TV sets, the Guangzhou municipal customs recently received a notice from the general customs administration that effective from 1 November 1981, the duties on some imported commodities will be revised. After the revision, the duties on TV sets will increase by 5 times, on tape recorders the duty will be doubled and on pocket electronic calculators the duty will be approximately doubled, as compared with the original duties. [Guangzhou Guangdong Provincial Service in Mandarin 2300 GMT 31 Oct 81 HK]

HUNAN CONTRACTS WITH PAKISTAN--On 3 October, at the Hunan Provincial machinery, electrical appliances, light industrial and textile products and new daily-use machines fair, the Provincial Machinery and Equipment Import and Export Company signed three contracts with Pakistan I firms. The total number of diesel engines involved in the export contracts was 560, the value of which is $150,000. The foreign firms were interested in the No 2105 diesel engine manufactured by Hunan Motor Plant and in the diesel engines manufactured by Xiangtang Diesel Engine Plant. After their visit to these two plants, they signed these contracts. [HK291017 Changsha Hunan Provincial Service in Mandarin 2300 GMT 12 Oct 81]

JILIN FOREIGN TRADE--Jilin Province has successfully advanced foreign trade transactions. By 20 September, the province's import-export volume had reached 173.5 million dollars. The export volume was 101.6 million dollars, more than a 100 percent increase over the corresponding 1980 period. The import volume was 11.9 million dollars, more than a 200 percent increase over the corresponding 1980 period. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 28 Oct 81 SK]

PLA RAILWAY CORPS COMMENDS ADVANCED PERSONNEL

OW210401 Beijing Domestic Service in Mandarin 1200 GMT 20 Nov 81

[Text] The leading organ of the PLA railway corps held an award presentation meeting on the afternoon of 18 November to commend advanced units and individuals who had made remarkable achievements in repairing the flood-damaged Baoji-Chengdu railway.

When the Baoji-Chengdu railway was damaged by the recent flood, some 2,000 fighters and commanders of a certain unit under the PLA railway corps were ordered to take part in the repair of the most seriously damaged and most difficult to repair middle section of the railway. After 14 days and nights of arduous work and by overcoming various unexpected difficulties, they completed the repair work 22 days ahead of schedule, thereby achieving remarkable success in reopening the whole section of the Baoji-Chengdu railway to traffic.

Some 260 personnel of this unit rendered outstanding service in the repair work and some 1,440 personnel were cited for meritorious service. Commander (Jiang Beiyin) of this unit won a second class merit citation for leading his men in the work and for his outstanding leadership.

Speaking at the award presentation meeting, Commander Chen Zaidao and second political commissar Kuang Fuzhao of the PLA railway corps called on all ranks of commanders and fighters of the railway corps to learn from this unit the spirit of arduous struggle and earnest and down-to-earth work, to carry forward the fine tradition of always paying attention to the interest of the people and to make new contributions to the four modernizations.

HISTORICAL ATTITUDE TOWARD CAPITALISM, BOURGEOISIE REVIEWED

Beijing ZHONGGUO CAIMAO BAO in Chinese 15 Sep 81 p 3

[Article by Sun Qimeng [1327 6386 1322]: "Theories and Policies on National Capitalist Inudstry and Commerce and National Bourgeoisie According to Mao Zedong Thought"]

[Text] When China was ushered into the age of socialist revolution, the CCP and the Chinese people immediately faced a brand new historical task, namely, the replacement of the system of capitalist ownership by that of socialist ownership and the elimination of the national bourgeoisie. This was an arduous and complex task, but it had to be accomplished, because there could be no socialism to speak of if this task were left unaccomplished.

The facts show that our party led the Chinese people in the accomplishment of this gigantic historical task, and the manner of accomplishment was very remarkable. The "Historical Resolution" realistically says: "During the period of transition, our party creatively charted a course for socialist transformation that suited China's specific conditions. In dealing with capitalist industry and commerce, we devised a whole series of transitional forms of state capitalism from lower to higher levels, such as the placing of state orders with private enterprises for the processing of materials or the manufacture of goods, state monopoly of the purchase and marketing of the products of private enterprises, the marketing of the products of private enterprises, the marketing of products of state-owned enterprises by private shops, and joint state-private ownership of individual enterprises or enterprises of a whole trade, and we eventually realized the peaceful redemption of the bourgeoisie, a possibility envisaged by Marx and Lenin."

How was the task of eliminating the national bourgeoisie carried out? These were the facts for all to see: By 1956, the system of private ownership had been in the main replaced by that of socialist public ownership of the means of production; and, by 1966, fixed interest, a vestige of capitalist exploitation, had been abolished. In these concrete conditions, capitalists as a class ceased to exist in our country, and the vast majority of those who were able to work were transformed into laborers living on the fruits of their own labor. They even became a force contributing to the success of the state and socialist construction.

Despite certain mistakes in the course of this great, unusual social change, there was no shooting or bloodshed of any kind. On the whole, there was a fairly normal production and social order. Isn't this like a miracle? There were many causes of this miracle, but the most important one was that the party Central Committee, headed by Comrade Mao Zedong, had worked out a whole set of theories and policies based on the basic tenets of Marxism-Leninism and consistent with conditions in China, for the gradual elimination of national capitalism and the national bourgeoisie. These theories and policies constituted an important component of Mao Zedong Thought, and this component vividly showed the brilliant success of the application and development of Marxism-Leninism in China. All these were facts. Judging from the way former industrial and commercial workers recently studied the "Historical Resolution," we can see that the problem concerning the historical position of Mao Zedong Thought has been fairly satisfactorily solved, simply because irrefutable facts have enlightened even these people.

Difficulty may not be known to people who have not experienced it. If we review the past, there were at least five very difficult problems in the arduous revolutionary task, as mentioned above. First, during the period of socialist revolution, could the concept of dividing the bourgeoisie in our country into big bourgeoisie and national bourgeoisie remain valid? Second, did the national bourgeoisie in that historical period have a dual nature? If so, what were its main features? Third, would it be possible to transform national bourgeois elements into laborers living on the fruits of their own labor? Fourth, what policies should be adopted to substitute the system of socialist ownership for that of capitalist ownership? Fifth, what policy should be adopted in the elimination of national bourgeoisie?

On the first problem. It is the nature of all bourgeoisie to exploit the working class for profit. In old semicolonial and semifeudal China, such a class could be divided into two different types, namely, the big bourgeoisie of a compradore character and the national bourgeoisie. There was a controversy in the party over this concept, but Comrade Mao Zedong's scientific class analysis enabled him to triumph over his opponents. The victory of the new democratic revolution further proved that Comrade Mao Zedong's scientific theory was beyond dispute. Now the question is: In the period of socialist revolution, when the contradiction between the working class and the national bourgeoisie had become the principal contradiction in the country, in such circumstances was this concept already outdated or was it still valid? To this very sensitive question, Comrade Mao Zedong supplied an unequivocal answer on the eve of the founding of the People's Republic in his assertion that the national bourgeoisie was different from the compradore bourgeoisie, and that the former came under the category of people in a state under the people's democratic dictatorship. Later, the theories and policies dealing with the difference between the national bourgeoisie and the compradore bourgeoisie were treated as historical experiences of the party. In his book "On the Correct Handling of Contradictions Among the People," Comrade Mao Zedong also gave a very clear-cut exposition of these theories and policies. With the position of the national bourgeoisie--as a class to be eliminated--in our socialist revolution determined and confirmed in theory and policy, the other problems could be easily solved.

On the second problem. During the period of new democratic revolution, the national bourgeoisie did have a dual nature, as clearly proved not only in theory but also in historical experience. How was this nature manifested under conditions of the socialist revolution? On the eve of the founding of the People's Republic, Comrade Mao Zedong pointed out that, in that period, the national bourgeoisie had its importance, on the one hand, and its weaknesses because of its social and economic position, on the other. Later, he also concretely analyzed the dual nature of the national bourgeoisie and clearly pointed out: "In the period of socialist revolution, it exploits the working class for profit, on the one hand, and supports the constitution and willingly accepts socialist transformation, on the other." It was this dual nature which differentiated the national bourgeoisie from the compradore bourgeoisie as a particularity of contradiction. When the qualitative difference in the particularlity of contradiction is grasped, we can adopt different policies to solve contradictions of different natures.

On the third problem. Since exploiters and laborers are irreconciliable enemies, can national bourgeois elements be truly transformed into laborers living on the fruits of their own labor? To people accustomed to a metaphysical point of view, this type of transformation would be impossible. Even many of our comrades were not optimistic or positive about such a transformation, thinking that only a small number of advanced elements could be transformed. Comrade Mao Zedong repeatedly pointed out that people can be transformed. On the eve of the founding of the People's Republic, he proposed that, during the nationalization of private enterprises, we should carry out further education and transformation of the national bourgeois elements. Soon after the establishment of joint state-private ownership of enterprises of a whole trade, he again clearly pointed out that the bourgeois elements had already become managers of the enterprises under joint state-private ownership, and were in the process of being transformed from exploiters into laborers living on the fruits of their own labor. He also cited the abolition of fixed interest as a sign of the removal of the bourgeois label or the transformation of exploiters into laborers. He summarized the direction of this transformation in the phrase "abolition of class but survival of individuals." When the national bourgeoisie had been abolished as a class, what social status would the members of this class acquire in the socialist society? They continued to exist in our socialist country as socialist laborers, and to actively participate in socialist construction with good results. This was how things changed.

On the fourth problem. Based on our investigations and analyses of national capitalist industry and commerce and the above theories, our party and government adopted the method of peaceful transformation instead of violent methods for the solution of the problem of the capitalist private ownership of the means of production. To put it simply, only two methods were used: First, redemption and then payment of a fixed interest. Fixed interest was on the one hand, a token of separation of the capitalists from the means of production they formerly possessed. In essence, it represented a further step forward in the transformation of capitalist ownership of the means of production. The other method was the adoption of a national capitalist policy and then the transformation of joint state-private enterprises into state enterprises. All these became historical events in our country.

On the fifth problem. In view of the dual nature of the national bourgeoisie, the party, generally speaking, adopted the policy of unity (but not all unity) and struggle (but not all struggle), or what was called the policy of "unity, criticism and education." Generally, this type of criticism and education was integrated with the socialist transformation of national capitalist industry and commerce, and was called a "dual transformation," meaning the transformation of capitalists into laborers hand in hand with the transformation of capitalist enterprises into socialist enterprises. In carrying out this transformation, the party gave full play to the roles of the democratic groups (China's National Construction Association), the mass organizations formed by the industrialists and merchants themselves (the Industrial-Commercial Federation), and the backbone elements among them, in an effort to change the criticism and education of the national bourgeoisie by the working class into self-criticism and self-education by the national bourgeois people themselves. This method was highly successful, and the cause of success was that, in carrying out ideological education, we firmly upheld the basic tenets of dialectical materialism and proceeded from objective realities instead of subjective assessment, so that political and ideological work and encouragement for them to serve socialism became harmoniously integrated instead of being separated and set against each other. Experience has shown that the success of failure of political and ideological work depends on whether or not we can uphold the guiding thought of correctly distinguishing the contradiction between the enemy and ourselves from the contradiction in resolving contradictions in ideology among the people; and whether we can adhere to the basic method of unity-criticism-unity. We can say that such an experience is still useful today.

'DAZHONG RIBAO' ON SYSTEM OF ECONOMIC RESPONSIBILITY

Jinan DAZHONG RIBAO in Chinese 4 Oct 80 p 1, 3

[Editorial: "Continue the Vigorous Promotion and Perfection of the System of Economic Responsibility in Industry"]

[Text] Since the system of economic responsibility was adopted on the industrial-communications front in our province, both the production by enterprises and the spiritual outlook of the workers have undergone a remarkable change and a new atmosphere rarely seen in recent years now prevails. The morale of cadres has been heightened, the enthusiasm of workers has been further aroused, and the management of enterprises has been further improved, resulting in a general increase in both production and income. Compared with the first four months, the total industrial output value in the province in the period from May to August increased by 0.2 percent, and the profits handed over to the state increased by 43.9 percent. How can the system of economic responsibility have played such an important role? Essentially, the close combination of authority, responsibility and benefits under the system of economic responsibility has formed a direct link between the distribution of enterprise profits and the result of business management, and between the workers' economic gains and their labor expended. This system has changed the time-honored practice of "eating out of the same pot" and equalitarianism in industrial management and the separation between authority, responsibility and benefits, and has thus greatly aroused the enthusiasm of the enterprises and the broad masses of workers and staff members. As a result, the enterprises have improved their management and given full play to the innate forces of production. The tremendous role played by the system of economic responsibility can never be overestimated. It signifies an important reform in the system of management. Its orientation is correct and its significance profound and far-reaching. We must continue to promote and perfect this system with great efforts and be determined to carry this reform through to the end.

The adoption of the system of economic responsibility involves many problems relating to policies and the overall situation. Since we are inexperienced in this respect, we must be very careful in studying the new situation and in guarding against the emergence of new problems so that the system of economic responsibility can continue its improvement and healthy development.

The enterprises practicing the system of economic responsibility should pay great attention to the close combination of production and social needs, and organize their production according to social needs and state planning. The purpose of the system of economic responsibility is to fully arouse the enthusiasm of the broad masses of workers and staff members, to tap the potential of enterprises, to increase economic benefits, and to produce more goods to meet social needs. In production, therefore, they should make every effort to complete their profit plans and to make maximum economic gains with regular and proper methods. At the same time, they should produce readily marketable goods of fine quality to meet social needs. If they produce purely for profit and pay no attention to the quality and variety of the products or to social needs, they will bring about new waste and unjustifiable loss to the society. To promote the close integration of production by the enterprises and the needs of the society, contracts for the supply of goods should include not only the profit index but also stipulations on the quantity, quality and variety of products. There should also be an overall evaluation of the enterprise's performance, and if it fails to measure up to the terms of the contract, its share of the profits should be appropriately reduced. By this means, we will guard against a dislocation between production and social needs resulting from reluctance on the part of the enterprise to produce anything that is not highly profitable. It can also help guard against sloppy work on the part of the enterprises, paying no attention to quality and ignoring the inconvenience thus caused to the customers. The inclusion of various main indexes in the contract serves the purpose of prompting the enterprises to the overall fulfillment of state plans. For the production of commodities that can bring little or no profit, appropriate allowances should be made for the enterprises concerned in the profit tax so as to arouse their enthusiasm for the production of less profitable items.

The enterprises practicing the system of economic responsibility should attach great importance to the improvement of the quality of their products. They should carry out conscientious education among their workers and staff members in "the primary importance of quality," and cultivate their sense of responsibility to the customers. In the case of enterprises paying piecework wages or above-quota piecework wages, the unit price should be determined on the basis of quality of the goods produced, according to the principle of more pay for high quality and less pay for low quality. The differences in piecework wages should be suitably enlarged so that the workers producing fine quality goods will receive better pay. The enterprises adopting the system of rewards should treat the quality of products as an important criterion for the evaluation of work, and there should be rewards for fine quality and punishment for inferior quality. These measures will encourage the workers to strive for good quality instead of quantity at the expense of quality.

The enterprises practicing the system of economic responsibility should carefully handle the relationship among the state, the enterprise and the workers. This is an important indication of the success or failure of the system of economic responsibility. At present, some enterprises are overstressing the interests of one or two parties and neglecting those of the third party. This is incorrect. They should carry out widespread and serious education among the workers and staff members on the need for the interests of all three parties to be considered. Everyone should be aware of the present financial difficulties of the state and the need to complete the major task of handing over state profits. The share for workers and staff members cannot be raised excessively; otherwise, it will add to the state's financial difficulties and to the pressure on supplies on the market. These enterprises must consider various aspects and on the basis of developing their production, steadily increase the income of their workers and staff members every year. This is consistent with the interests of the state as well as with the long-range benefits of the workers and staff members. This reason should be repeatedly and clearly explained to the workers and staff members. The correct handling of relationships among the three parties essentially means the increase of the enterprise's share of profits and the increased income of workers and staff members, provided the increase of state revenues is assured. The share of profits for the state should be larger than those of the enterprise and the workers, and the increase in wages should be commensurate with the increase in profits and the rise in labor productivity. An important point to note in the handling of relationships among the three parties is that the per unit production cost and the wage component in the production cost must be lowered instead of being raised. Specifically, there should be a rational base figure for contracted work and a rational ratio for profit sharing, in addition to an average advanced quota and a rational wage rate for piecework. These criteria have a direct bearing on the benefits of all three parties and must therefore be carefully followed. The enterprises paying piecework wages or above-quota piecework wages as a rule cannot appropriate any bonus fund, while those practicing the reward system should strictly control the rewards within set limits. At the same time, they must strictly enforce financial and economic discipline through constant inspections and supervision. Any violation of established policies, such as increase of prices in disguise, indiscriminate payment of subsidies, increase in production costs at will, withholding of state profits, tax evasions and so forth must be promptly exposed and rectified, and serious violations should be severely dealt with. In short, there should be more active leadership and strengthened supervision in order to insure the correct handling of the interests of all three parties and to guard against any discrepancy.

In popularizing the system of economic responsibility in the industrial-communications sector at present, great attention should be paid to the system of responsibility within each enterprise. For enterprises, workshops, work teams or even individuals whose output can be accounted for independently, the systems of piecework wages, above-quota piecework or small collective piecework wages should be adopted as soon as possible. If conditions are not yet favorable for these systems, great efforts should be made to create the required conditions for them to be enforced. The leading cadres of enterprises should also practice the system of economic responsibility. First, a system of job responsibility should be set up so that every leading cadre will clearly know his own responsibility. The system of job responsibility should be linked with the system of distribution according to work, and there should be both reward and punishment. The departments in charge of enterprises should likewise set up their own system of economic responsibility, which should clearly spell out the main responsibility of these departments in charge, namely, to help the enterprises solve the problems of coordination between production and marketing and other key problems in production, and to provide the necessary conditions for the enterprises to complete their production tasks. These departments in charge should also sign economic contracts with the enterprises and scrupulously observe these contracts. Those who have helped the enterprises increase production and income should be rewarded; if the reverse is the case, they should be held economically liable according to the contract terms.

Contracted work forthcoming on the industrial-communications front of the province should be quickly attended to. In principle, the base figures in this year's contracts should be used for those of the coming year, but allowances should be made for increases in production. For the enterprises that are expected to increase their profits, a certain percentage can be added to the base figures used in this year's contracts. The sharing of profits can also be correspondingly readjusted. As to those enterprises whose production tasks are expected to undergo a drastic change next year, readjustments should be made on the merits of each case. As a general rule, the contracted work for the next year should not be based on the tasks actually completed so far this year; otherwise, it may dampen the enthusiasm of the enterprises and the workers in the task of increasing both output and income in the last quarter of this year and in the coming year.

The adoption of the system of economic responsibility marks a breakthrough in the consolidation of enterprises and the improvement of enterprise management. After the adoption of this system, we must be careful in directing the enterprises' innate motive forces toward the consolidation of the enterprises, the improvement of their management and the increase of their economic benefits. There is now great waste among the enterprises. In some enterprises, "gold is littered everywhere." Therefore, one of the urgent tasks for the industrial-communications front is to consolidate the enterprises, eliminate the waste, and tap the potential of these enterprises. We should increase our efforts in streamlining and setting up leading bodies for the enterprises, in perfecting their leadership system, and in strengthening their basic work. We should also strengthen labor discipline, continue to learn from the experiences of Shanghai, and improve the management of enterprises. The provincial and various local authorities should work out their plans for consolidating the enterprises, with particular emphasis on streamlining those enterprises having high output value and earning high profits and those incurring losses. We should consolidate a number of backbone enterprises this year. A list should be compiled of the enterprises to be consolidated, and this work should be divided up and assigned to different leading cadres. Examination and evaluation of the results should be based on the six criteria for the consolidation of enterprises. Consolidation will help further strengthen the leading bodies, markedly raise the management and technical standards, and achieve better economic results in production.

PROBLEMS OF ECONOMIC RESPONSIBILITY SYSTEM DISCUSSED

Jinan DAZHONG RIBAO in Chinese 5 Oct 81 p 3

[Article by Lian Yanguang [6647 1693 1639] of Jinan Municipal Social Science Research Institute: "Discussion on Several Problems of the System of Economic Responsibility"]

[Text] The system of economic responsibility in various forms has now been popularized with great success on the industrial-communications and the finance and trade fronts throughout the country. As proved in practice, this is an effective measure to tap the potential of enterprises and to arouse the enthusiasm of workers, as well as the only way to improve the operation of socialist enterprises. Since we have not had much experience in the responsibility system, however, there are still many problems in our work which should be continually studied, changed, and gradually improved in practice. Our views on various problems in the practice of the system of economic responsibility are as follows:

Working out a rational and advanced index. Practice of the system of economic responsibility is a fairly good way to implement the principle "to each according to his work." However, we must work out an index which is both rational and advanced. The system of economic responsibility can take different forms in different trades, but all forms have a common characteristic, namely, distribution according to work by "linking output with remuneration." What base should be set for contracted work? What ratio should be used for sharing profits? What criteria should be adopted for evaluating the result of labor? What should be the per-unit price of piecework? In short, to what "output" should "remuneration" be linked? There should be some scientific data for working out a rational and advanced index. We must have such an index before we can successfully link output with remuneration in an enterprise, harmonize the relationships between various types of work and between various sequences of operation so that all workers will work in unity and strive to overfulfill the quota set for the enterprise. Only thus can we command an overall view of different enterprises, evaluate the business performance of each enterprise with fairness, handle the relationship between the advanced and the backward enterprises, and spur on the latter to catch up with the former. Only thus can we satisfactorily handle the relationships between the interests of the state, the enterprise and the workers, and enable the enterprises to retain more profits and the workers to receive more income, with increased state revenues as a precondition.

To work out a rational and advanced index for an enterprise, we should first form the concept of distribution according to work, or calculation of the result of labor according to the socially necessary time expended, and, based on this concept, use the average advanced standard of other enterprises of the same trade, same type and same grade as a reference in working out the index of this particular enterprise. Second, we should note the historical background and the present situation of the enterprise, such as the method used by the enterprise to fulfill its task the previous year, the average figure and the progressive rate of increase in the three preceding years, and the highest standard it has ever attained, before working out the index for the current year. Third, we have to analyze the changes in market conditions in the current year and other objective elemtns, and then work out separate estimates for different trades and enterprises under different conditions. Fourth, the set index cannot remain unchanged despite the continued development of productive forces and changes in the market. While preserving a relative stability, we should revise the index from time to time in order that this index can be rational and advanced.

For some time, some units worked out their index without scientific data or taking the amount of socially necessary labor into account. Thus the index turned out to be either too high or too low. If it is too high and exceeds the capacity of the available socially necessary labor, below-average enterprises and workers cannot hope to overfulfill their tasks, and their enthusiasm will be dampened. If it is too low, or below the demand of the amount of socially necessary labor, the below-average enterprises and workers can easily obtain above-quota "remuneration," thus causing an imperceptible increase in the wage component of the per-unit production cost. This is the main trend at present. Besides hindering the tapping of potential among the enterprises and dampening the workers' enthusiasm, it also produces adverse effects on the relationship among enterprises because of the protection of the backward at the expense of the advanced ones. At the same time, it is detrimental to state interests and must therefore be overcome.

Strengthening supervision. The purpose of the system of economic responsibility is to further arouse the enthusiasm of enterprises and workers, to increase production, and to promote commodity circulation in order to better meet the requirements of consumption. However, because of inadequate enterprise management and insufficient supervision from the departments concerned, some problems deserving our attention have emerged. Some enterprises are so concerned with profit and personal gain that they never bothered about the renovation or replacement of their equipment even though it is due. They may even do sloppy work with inferior materials, produce substandard goods, add impurities, use short weight and short measures as a means of cheating, or raise the selling prices at will. This is detrimental to the interests of the state and the customers, and is a deviation from the purpose of the system of economic responsibility and from the orientation of the socialist business operation. It clearly shows the necessity of strengthened supervision. Since the adoption of the system of economic responsibility, the enterprises have acquired certain autonomy under flexible policies and have brought vitality to the economy. Along with the increasing flexibility of policies, there should also be stricter supervision in order that such flexibility does not lead to chaos.

To strengthen supervision, we should first set up and perfect a system of rules and regulations and the criteria for examination. The first requirement is to work out a comprehensive index system for an overall examination of the results of production by the enterprises and workers and the conditions of work so as to preclude the undesirable practice of using only one or two indexes as the basis for an overall judgment. The society demands the services of the enterprises and workers in terms not only of quantity but also of quality in production. It also demands good products as well as low prices; and expanded production as well as lower production cost and reduced operating expenses. Therefore, there should be a comprehensive index system before there can be an overall evaluation of the performances of the enterprises and workers, which can in turn be used as the basis to decide on the ratio of profit retention and the remuneration of workers. The second requirement is to set up a system of punishment. If any loss is incurred because of poor quality, the producer has to compensate for the loss. Should there be any complaint from customers, the producer must apologize and forfeit its bonus. Cheating on the quantity or increasing prices at will should also be punished. In short, anything harmful to the interests of the customers should have a direct bearing on the economic benefits of the producer.

Second, the masses should be encouraged to exercise their supervision. Through workers' congresses, the workers should be mobilized to participate in management, to exercise their supervision, to uncover and solve problems, and to pursue the political and economic liability of the culprits. It is also possible to let the customers exercise their supervision by installing boxes for exposure letters and providing customers' comment books so that they can expose and criticize those whose behavior is against mass interests.

Third, the industrial and commercial administrative organs should be given full play. A supervisory organ should be set up with the industrial and commercial administrative organs as the core, to be supplemented by workers' representatives or the responsible persons of the enterprises. The masses should be encouraged to carry out constant checks on the quality of products, the accuracy of the means of measurement, and the attitude toward customers. We must be sure that the supervision and expression of opinions by the masses can produce the desired result.

Strengthening ideological education. The purpose of socialist production is to better satisfy the constantly increasing material and cultural needs of the whole society, while the system of economic responsibility is precisely a means to serve the purpose of socialist production. From the standpoint of relationship between the state and the enterprise, we can see that in practicing the system of economic responsibility, it is necessary to recognize the enterprise as a relatively independent economic unit to be provided with certain decision-making power, so that the enterprise, after fulfilling its obligations to the state, can organize the production and circulation of goods to the best of its ability and according to social needs. The enterprise should also actively serve the purpose of socialist production and consciously streamline the relationships among the state, the collective and the workers.

Since the adoption of the system of economic responsibility, however, some enterprises and individuals have been so preoccupied with "money" that they could not correctly exercise the decision-making power given them by the state. Disregarding the planning and arrangement of the state and the needs of the broad masses, they produce only goods of high value which can bring greater profits, resulting in the serious reduction of small commodities, accessories and spare parts and a shortage of these products compared to the demand. In circulation, some commercial departments are dealing in whatever can bring greater profits regardless of the demand of the masses. They are not interested in transactions over such small commodities as sundry goods, small metal wares, and small indigenous products needed by the masses. In distribution, they only try to increase the individual gains and the enterprises' shares of profits regardless of state revenues. All these practices show the urgent need for ideological and political work. The view that everything will be fine as soon as the system of economic responsibility is enforced, and that the strengthening of ideological and political work is unnecessary is impractical. There should be an organic combination of economic means, administrative supervision, and ideological education.

The workers should be educated to set right the relationships among the state, the collective and the workers. In production, circulation and distribution, first consideration should be given to state planning and state interests. Provided the increase of state revenues is assured, the enterprises can retain more profits and the individuals can earn more money. The enterprises should be concerned with the overall situation, take a long-range view, and consider the viewpoint of the masses. They should give more thought to the state and the customers, because the state must be wealthy and production must be developed before the interests of the workers can be safeguarded. We should encourage greater contributions to the state; commend the advanced collectives and activists who work hard and are devoted to public interests; and criticize those units and individuals whose "public spirit" is confined to only small sectors of the public and who substitute selfishness for public spirit. All these measures must be taken to promote the socialist cause.

JIANGSU HOLDS FINANCE, TRADE WORK MEETING

OW181056 Nanjing Jiangsu Provincial Service in Mandarin 1100 GMT 17 Nov 81

[Excerpts] According to a report by our station reporter (Tang Shengpei), the Provincial People's Government held a financial and trade work meeting in Nanjing from 12 to 16 November. Attending the meeting were responsible comrades in charge of financial and trade work in the various prefectures and municipalities and responsible persons of the departments concerned. Presiding over the meeting was Liu Hegeng, member of the standing committee of the Provincial Party Committee and vice governor. Speaking at the meeting was Zhou Yifeng, member of the standing committee of the Provincial Party Committee and vice governor.

The meeting focused its discussions on doing a good job in vegetable production and marketing work and solving well urban people's vegetable problems. The meeting put forward some practical and effective measures.

The vegetable problem is a major event in the lives of the urban people, involving thousands of households. The Provincial Party Committee and the Provincial Government have attached great importance to this matter, and the various prefectures and municipalities have done a great deal of work in this regard. However, the vegetable problem has not as yet been solved well.

The meeting called for a conscientious job in grasping the vegetable production and supply work for this winter and next spring, especially the supply work on the two major festive occasions, namely, New Year's Day and the Spring Festival.

The meeting also studied financial problems and called on all localities to practically strengthen their leadership over financial work and actively support the work of the financial and tax departments. The meeting urged all leading comrades to go deep into the grassroots levels in person to carry out investigations, study, inspection and supervision and do a good job in ideological and educational work.

The meeting called for vigorous efforts to settle overdue taxes and profits, collect and deposit all of this year's taxes and profits that should be turned over to the state before the end of the year and hit the targets for struggle handed down by the Provincial Government.

LIANG XIANG ON GUANGDONG SPECIAL ECONOMIC ZONE

HK161432 Hong Kong TA KUNG PAO in Chinese 13 Nov 81 pp 1, 2

[Text] Guangzhou, 12 Nov--In his report "On the Work of the Special Economic Zones and the Drafting of Several Provisional Regulations" given at the 13th session of the Standing Committee of the provincial people's congress convened in Guangzhou this afternoon, Liang Xiang, provincial vice governor, mayor of Shenzhen and first secretary of the Shenzhen Municipal CCP Committee, said: "At present, a prominent trend in our import work is that some foreign firms have been getting more and more interested in investing in reclaiming land. For example, Howell Holdings of Hong Kong is ready to make an investment of HK$2 billion in a joint operation with us to jointly reclaim 30 square kilometers of land in Fujian and turning it into a new industrial city with commercial and business centers, residential quarters, cultural, educational, public health and municipal administration facilities, and a railway, highway and sea transportation network. According to the initial plan for building the new urban areas, the projects in the first stage inlcude the building of an electric train station in the central district, the Huanggang-Lemazhou highway and bridges, a gasworks, a transformer substation, a waterworks, a shallow-water pier and an office building for the special zone's government. The contract for this joint reclamation will be signed very soon. The Ta Pao [1129 1405] Company of Hong Kong is also planning to make an investment of HK$1.3 billion in jointly reclaiming 6 square kilometers of land in Chegongmiao and making it an industrial area. Details of this agreement are now under discussion. For another example, the Lien Cheng [5114 1004] Enterprises Corporation of Hong Kong has signed a contract with us for jointly developing 6 square kilometers of land near the Houhai Gulf, including the construction of several universities and the opening up of 260,000 square meters of land in Wenjindu to turn it into a light and electronics industrial base.

The investment in these two projects is planned to be HK$2.4 billion.

Fleeing From Our Country Has Basically Ceased

Liang Xiang said: "Over the past 2 years, since the establishment of the special economic zones, the industrial and agricultural production in Shenzhen has been greatly developed and the people's income has increased. This has resulted in reassuring the public and stabilizing the border situation. In 1980, the total industrial and agricultural output values respectively increased by 75 and 116 percent over the previous year. The local revenue and the municipal's income from foreign exchange have respectively increased by 54 and 32 percent over the previous year. The collective distribution to rural communes and brigades was 440 yuan per capita, which was an increase of 39.2 percent over the previous year. Now the phenomenon of fleeing from our country has basically ceased. Moreover, we are glad to see that some people who had fled, have returned. Practice has shown that the decision of the central authorities to establish special economic zones as an experiment, is entirely correct. To do a good job in this respect will not only end the importation of advanced technology and equipment by using foreign funds, the study of applicable management experience and the accumulation of more foreign exchange for the four modernizations, but will also have far-reaching influence on the stabilization of Hong Kong and Macao and the return of Taiwan to the embrace of the motherland. This is more important. Now every step of advance in the development of Shenzhen special economic zone will evoke strong responses in the industrial and commercial circles in Hong Kong, Macao and Taiwan and will be noticed by the world media. This has proved, in another way, the importance and necessity of building our economic zones."

Liang Xiang also pointed out that the construction of the special economic zones "has been undertaken with insufficient ideological and organizational preparations and insufficient legal and financial preparations." Therefore, there are many difficulties that we are required to overcome through great efforts.

Liang Xiang said: "Our tentative plan is that through our efforts in the next 2 years, 1982 and 1983, a sound basis will be built for the development of the special zones."

He also said: "We have submitted to this session of the Standing Committee of the provincial people's congress, five regulations for discussion and approval. They are: provisional regulations on labor and wages management in Guangdong's special economic zones (draft), 'provisional regulations on management of personnel who enter or leave Guangdong's special economic zones (draft),' 'provisional regulations on enterprise registration in Guangdong's special economic zones (draft),' 'provisional regulations on land in Shenzhen's special economic zones (draft),' and 'provisional regulations on administration in Shenzhen's special economic zones (draft).'"

The 13th session of the Standing Committee of Guangdong's Provincial People's Congress has been held in Guangzhou since 12 November.

The session is being presided over by Li Jianzhen, chairman of the Standing Committee. Vice Chairmen Zhong Ming, Qu Mengjue, Luo Ming, Yi Meihou and Luo Xiongcai, members of the Standing Committee from Hong Kong and Macao Sun Chengzeng, Ma Tingdong and others are present.

Topics for discussion at this session area: 1. To listen to a report of the provincial government on the special economic zones and to discuss and approve the provincial government's five regulations for the special economic zones; 2. To listen to a report of the provincial government on urban sanitation work and to discuss and approve the provincial government's "Provisional Sanitation Regulations for Guangdong's Urban Areas"; 3. To decide the date for the convention of the fourth session of the fifth provincial people's congress; and 4. To approve some appointments and dismissals.

REGULATIONS FOR SPECIAL ECONOMIC ZONES APPROVED

HK181007 Hong Kong WEN WEI PO in Chinese 18 Nov 81 p 1

[Dispatch: "Guangdong People's Congress Standing Committee Approves Five Regulations for the Special Economic Zones in the Province"]

[Text] Guangzhou, 17 Nov--The 13th session of the Standing Committee of Guangdong Provincial People's Congress approved today five regulations for the special economic zones. The five regulations will be reported to the NPC Standing Committee for rectification and promulgation. The session also examined and approved the "regulations regarding the management of sanitation" and "decisions on extending the time limit for handling cases," elected delegates to the Fifth NPC in a by-election, as well as approved appointments and removals.

The five special regulations for the special economic zones examined and approved by the session were "temporary provisions on management of enterprises, labor and wages in the special economic zones of Guangdong Province," "temporary provisions on management of personnel entering and leaving the special economic zones of Guangdong Province," "temporary provisions on management of enterprise registration in the special economic zones of Guangdong Province," "temporary provisions on management of land in Shenzhen special economic zone" and "temporary provisions on administrative management in Shenzhen special economic zone." The first three regulations will be applicable in the various special zones of the province, that is, Shenzhen, Zhuhai and Shantou; the last two regulations will be applicable in Shenzhen alone, while the two special zones of Zhuhai and Shenzhen will draw up their own relevant regulations in the light of the principles of the two temporary provisions, which will be put into effect after approval from the provincial people's government. These special regulations were drawn up by the provincial special zones management committee after the promulgation of "Regulations on Special Economic Zones in Guangdong Province." The drafts of these regulations were examined and revised at the working conference on Guangdong and Fujian provinces and special economic zones. Recently, the Standing Committee of the provincial people's congress sent an inspection team to Shenzhen special economic zone to conduct on-the-spot investigation and study and revise the special regulations; prior to the session held for the examination and approval of these regulations, the legal commission of the Standing Committee of the provincial people's congress held a special meeting to further revise the five regulations.

The reporter learned from the parties concerned that, besides the five special regulations examined and approved by the Standing Committee of the provincial people's congress, the drafts of other special regulations drawn up will be reported for approval to the departments concerned separately according to their natures and the demands of legislative procedure.

During the session, Deputy Governor Liang Xiang gave an account of the condition of Guangdong Province's special economic zones to the Standing Committee of the provincial people's congress, and gave some explanations on the five regulations. All Standing Committee members attending the session held serious discussions on the five regulations.

The session which was presided over by Li Jianzhen, chairman of the Standing Committee, was held in Guangzhou from 12 to 17 November.

HONG KONG COMPANY, SHENZHEN TO DEVELOP NEW TOWN

HK250116 Hong Kong STANDARD in English 25 Nov 81 p 1

[Text] A new town five times the size of Kowloon will be built in Shenzhen under a contract signed by Hopewell China Development and the Development Corporation of the Shenzhen Special Economic Zone (DCSSEZ) yesterday.

The agreement calls for an initial investment of HK$2 billion over 30 years, with the financial resources and technological know-how provided by Hopewell and land provided by Shenzhen.

Hopewell's executive director David Wong said that as the project progressed, total investment could reach as high as HK$10 billion during the 30-year period.

"This goes to show, as far as we are concerned, that the year 1997 is not a problem," he added.

A total area of 30 square kilometres will be developed in two stages into the "central district" of Shenzhen.

During the first phase of development, infrastructures such as electricity supply, communications facilities and highways will be constructed.

And in the second stage, industrial enterprises built in the area will be serviced by a network of commercial, residential, cultural and educational facilities.

Mr Wong said Hopewell will be inviting contractors to participate in the project. Other investors could also join by purchasing land from the Shenzhen Special Economic Zone new town development, a joint-venture company set up under the contract.

Mr Wong said profits from the undertaking will be divided three ways: DCSSEZ taking 50 percent, Hopewell 30 percent and the remaining 20 percent to the reinvested.

Detailed plans of the new town are still under consideration and would be ready in 3 months, Mr Wong added.

BETTER STEEL BOOSTS PROFITS DESPITE OUTPUT DROP

HK190150 Hong Kong TA KUNG PAO in English 19-25 Nov 81 p 3

[By TA KUNG PAO's Beijing correspondent]

[Text] Output of China's iron and steelworks will generally decrease this year over last year as a result of economic readjustment, yet income of many steelworks will likely increase, industry sources in China say.

The Capital Iron and Steelworks Co. is a case in point: Its steel output has reportedly dropped 5.85 percent in the first three quarters of this year over same period last year with iron output down 9.94 percent. Profit for this period, however, increased by 3.94 percent despite a decrease of 4.03 percent in total output value.

Sources attribute this to reorientation of China's steel industry which has over the past 3 years steered away from 'output for output's sake' toward serving light industrial needs and producing quality steel exports. Better management and strict energy conservation also contributed to lower production costs.

Statistics show that 77 percent of the 1978 profit growth of metallurgical industry under Shanghai was gained through output increase and the remaining 23 percent from decrease in production costs. Last year, only 47 percent of the profit growth was gained through output increase and a hefty 53 percent was gained through lower production costs.

To achieve stricter control of energy consumption in China's iron and steel industry, small uneconomical mills have been shut down and fuel-saving technology introduced to the bigger operations. In 1978, China's blast furnaces consumed a total of 73.80 million tons of standard coal equivalent or 13.04 percent of that year's national energy consumption. Last year, steel output increased by 5.34 million tons over 1978, but total energy consumption by the industry dropped to 70.90 million tons of standard coal equivalent. This took up only 11.43 percent of 1980's overall energy consumption.

China's steel industry had, until readjustment, geared itself to needs of heavy industry at the expense of light industrial growth. Consequently much needed steel for consumer goods such as strip steel for bicycles and sheet steel for durable goods were in serious short supply and had to be imported.

Recent changes in the commodity structure of steel products has begun to ease the shortage. Figures show that production of much-needed rolled steel, steel wires, sheet steel and welded steel pipes totaled 15.51 million tons (57 percent share of the year's total steel output) last year as compared to only 9.74 million tons (44 percent share of the year's total steel output) in 1978.

Industry sources report that the quality of Chinese ship plate, used in building ocean-going vessels for export, has improved. A third of the output, the bulk of which is made in Shanghai and Wuhan, reportedly is approved by the Lloyd's Register of Shipping.

In high-speed tool steel, China is also forfeiting quantity for quality. This year's output at 16,000 tons takes a substantial drop from 1978's 27,000 tons. In 1978, however, China had to import an additional 10,000 tons of tool steel because of the poor quality of her own output whereas this year's high-grade output will spare China of import needs. Half of this year's tool steel output could, moreover, be used for the manufacturing of cutting and drilling tools for export.

BRIEFS

CURRENCY BONDS ISSUANCE IN JAPAN--The China International Trust and Investment Corporation held its third board meeting in Beijing yesterday. It has been only 2 years since the corporation was established in October the year before last, but its business has developed very quickly. Not only this, but the corporation has also announced its intention to set up more offices abroad and to issue a 10 billion yen private bond issue in Japan at the end of this year or the early part of next year. This can be described as a bold and correct measure which merits attention. In the 2 years since the establishment of the corporation, the cooperation between China and foreign countries, the setting up of offices abroad and the forthcoming issuance of foreign currency bonds for the first time, have demonstrated China's steady progress in its open-door policy following the smashing of the "gang of four." 'CHINA POST' URGES DEVELOPING TAIWAN-ASEAN TRADE

OW120909 Taipei CHINA POST in English 9 Nov 81 p 4

[Editorial: "ASEAN and Taiwan"]

[Text] During the past decade, Association of Southeast Asian Nations (ASEAN), composed of Indonesia, Malaysia, the Philippines, Singapore and Thailand, has made significant if halting progress. In the years ahead the five member states are bound to attain many of their goals.

Chief of these is the creation of a free trade area among themselves. A customs union could come after this. This--in the view of some overly optimistic observers --why not a common market in the pattern of Europe's EEC?

These goals may eventually be attained. Meanwhile, what of ASEAN's relations with countries in their neighborhood?

Taiwan comes to mind. This country is at the doorstep of the ASEAN region, just an hour's flight from the Philippines. Whatever affects ASEAN would inevitably affect Taiwan.

ASEAN as of now is looking toward broadening its membership. Burma, Sarawak and Sri Lanka are said eager to join and are being considered. Others may follow.

Taiwan may not be a member nor would it seek admission into ASEAN. However, the regional bloc does not operate only among its members, but has been formed precisely to trade as a unit with other countries outside the bloc.

Taiwan, being in the periphery of the bloc, could and should be an active trading partner of ASEAN. To be sure, this country produces roughly similar commodities as the ASEAN countries have to offer. But there are goods that Taiwan can produce and export that command a good market among the bloc countries, and vice versa. This could make trading between Taiwan and the ASEAN members a profitable and desirable proposition.

Something should be done to exploit this situation. No matter how long it takes, any step in this direction should benefit this country and ASEAN as well.

'JINGJI YANJIU' ON DEVELOPING ECONOMIC SCIENCE

HK200951 Beijing JINGJI YANJIU in Chinese No 10, 20 Oct 81 pp 3-15

[Article by Yu Guangyuan [0060 0342 6678]: "Develop Economic Science to Promote Socialist Modernization"--Report delivered at the first annual meeting of the Chinese Economic Integrated Federation on 3 September 1981]

[Text] 1. Review of the Development of Economic Science Since the Founding of the PRC

Since the founding of the PRC, economic science has undergone the following stages of development.

First, before the "great cultural revolution," under the guidance of Marxism, economic science made considerable achievements through studying and summing up the experiences and lessons of the socialist transformation and socialist construction and exploring new problems that had arisen in practical economic life. At the same time, in the socialist part of the study of political economics, there emerged some views deviating from Marxism.

In the recovery period of the national economy and in the early period of the first 5-year plan, in accordance with the economic work and ideological education at that time, the economic circles did a lot of work to popularize Marxist economic theory and started their research work.

From 1954 to 1956, enlightened by Stalin's expositions on the objectivity of the economic laws in his "The Socialist Economic Problems of the Soviet Union," the economic circles had lively discussions on the form of the system of ownership of the means of production in China's transitional period and the question of the economic laws, made relatively detailed analyses of the forms, characteristics and interrelations of the economic laws which functioned in China's economy at that time and expounded the leading role of the socialist economic laws (in particular the socialist basic economic law) in the transitional period. That discussion was a useful attempt to integrate Marxist economic theory with China's economic reality.

From 1956 to 1957, in such works as "10 major relationships" and "problems on the correct handling of contradictions among the people," Comrade Mao Zedong initially summed up the experiences in China's socialist construction, set forth the task of exploring a way of building socialism suited to China's national condition, stated his brand new views that we should promote the greater and faster development of heavy industry by developing some more agriculture and light industry and stressed that in the socialist construction, equal consideration should be given to the interests of the state, the collective and the individual. Later on, he further pointed out that we must take agriculture as the foundation and that economic plans must be arranged with the priority proceeding from agriculture to light industry and then to heavy industry. Under the guidance of these creative theories, China's economic circles have opened up new fields of study.

In 1956 in his speech delivered at the 8th CCP National Congress, Comrade Chen Yun put forth many important assumptions on the industrial and commercial management, production plans and market, thus breaking through the restrictions of the highly centralized economic management system practiced for many years by the Soviet Union and other socialist countries. It gave a useful inspiration to the economic circles for restudying the formula of the socialist economy.

Through summing up and studying the rich experiences in China's socialist transformation and the problems that had arisen in its industrialization, the economic circles discussed the concrete form of the law that the relations of production must suit the nature of the productive forces which functioned in China and how to act upon this objective law so as to win victory for the socialist cause.

In 1956, a year when the socialist transformation had basically been completed, the question of how to understand the role of commodity production and the law of value in the socialist economy was put on the agenda. The economic circles had lively discussions on this question and advanced some important questions and views. In 1958 after the attempts to abolish commodity production and the exchange at equal value had run up against a stone wall in the movement to organize people's communes, Comrade Mao Zedong pointed out that the continuous development of commodity production was a matter of vital principle in socialist construction and that the law of value was the famous thesis of "the great school" for building socialism and communism. A national discussion on economic theory was held in Shanghai in April, 1959. The meeting carried out a discussion on the questions of commodity production and the law of value (and the questions of the principle of distribution according to labor and piece rate wages). During the discussion, some economists deliberated as to the inevitability and the historical role of the relations between commodity and money within the inner sectors of the system of ownership by the whole people and proposed that we should acknowledge and attach importance to the regulatory role of the law of value in the socialist economy and expounded that the role of the law of value and the role of the law of developing the national economy in a planned way are not mutually exclusive but identical.

During the late 1950's and the early 1960's, while correcting the errors of the "great leap forward" and the movement to organize people's communes, Comrade Mao Zedong pointed out that there must be no expropriation of the peasants, that a given stage of social development should not be skipped, that egalitarianism must be opposed and that we must strike an overall balance in economic planning. Comrade Liu Shaoqi said that a variety of means of production could be put into circulation as commodities and that there should be a double-track system for labor as well as for education in socialist society. Comrade Zhou Enlai said, among other things, that the overwhelming majority of Chinese intellectuals had become intellectuals belonging to the working people and that science and technology would play a key role in China's modernization. Comrade Chen Yun held that plan targets should be realistic, that the scale of production should correspond to national capability, consideration should be given to both the people's livelihood and the needs of state construction, and that the material, financial and credit balance should be maintained in drawing up plans. Comrade Deng Xiaoping held that industrial enterprises should be consolidated and their management improved and strengthened, and that the system of workers' congresses should be introduced. Comrade Zhu De stressed the need to pay attention to the development of handicrafts and of diversified undertakings in agriculture. Deng Zihui and other comrades pointed out that a production responsibility system should be introduced in agriculture. All these views are of great practical and theoretical significance. In this period, the economic circles had discussions on the three major theoretical issues of socialist business accounting, economic effect and reproduction. These issues are of great significance. The discussion of the first two issues aroused people's attention to having strict business accounting and stressing economic effect, enabled people to attach importance to the role of socialist interests and to concern themselves with the relations between consumption of labor and useful results. The tasks of study put forward at that time are still of practical significance now. The discussion on the question of reproduction pointed out that under socialism, the relations between simple reproduction and expanded reproduction should be correctly handled and that in realizing expanded reproduction there should be not only additional means of production but also additional means of subsistence, and that in the development of the socialist economy, there did exist the highest and lowest limits for accumulation and consumption.

During this period, apart from publishing a great number of economic works of academic value, China organized force to compile some teaching materials of the various branches of economic science and published large batches of historical and practical economic data which had been systematically sorted out.

Before the "great cultural revolution," under the influence of the "leftist" erroneous guiding thinking in economic construction, some views deviating from Marxism were prevalent in economic circles. For instance, there was an insufficient understanding of the objectivity of the economic laws. It was believed that after the basic completion of socialist transformation, the contradiction between the socialist road and the capitalist road remained the principal contradiction of the socialist economy. One-sided emphasis was put on the argument that having more people was a good thing. The proposition of having birth control was regarded as Malthusianism. The principle of material interets of the socialist economy was asserted categorically as the capitalist principle. The need for a system of piece rate wages was negated. The argument of "restricting" the role of the law of value was not uncommon. Paying close attention to the economic effect and attaching importance to the role of interest in socialist economic management were regarded as heretical beliefs. It was supposed that the bigger the collective accounting unit and the higher the level of collectivization of the system of ownership were, the better.

Second, during the "great cultural revolution," the economic sciences were subjected to damage and trampled underfoot.

During the "great cultural revolution," along with the increasingly serious erroneous development in practice of his theories on class struggle in socialist society, Comrade Mao Zedong also advanced some erroneous views on economic theory.

Taking advantage of the aforesaid errors of Comrade Mao Zedong, Lin Biao, Jiang Qing, Kang Sheng and their like preached with ulterior motives a series of economic theories of sham socialism. They brazenly denied the objectivity of the economic laws, opposed the so-called "unique importance of the productive forces." Negated socialist commodity production and the principle of distribution according to labor, categorically asserted that they were the economic bases for breeding new capitalists and even breeding the bourgeoisie within the CCP, opposed the socialist business accounting and management systems and wantonly repudiated the so-called "putting productive force in command," distorted the principle of self-reliance and opposed the development of necessary economic ties with other countries by flaunting the banners of opposing the "slavish comprador philosophy," "national betrayal," and so forth. In the so-called symposiums held in Beijing, Liaoning Province and other places, the "gang of four" advocated their fallacies, organized the so-called social and economic investigations in Shanghai to compile "socialist political economics" and made a desperate attempt to systematize their absurd economic theories to create "theoretical bases" for usurping the party leadership and state power.

The "gang of four" indulged in cultural autocracy on a large scale. During the "great cultural revolution," the economic research organizations were closed down or compelled to stop working, many financial and economic colleges and schools and many economic specialized organs were abolished, all economic theoretical magazines were forced to stop circulation, large numbers of economic scholars were attacked and persecuted, thus all economic research work was brought to a standstill for a long time, and was unable to contribute to China's economic science.

Because Marxist economic science was flagrantly flogged and the theory of the unique importance of subjective willpower in practical economic work spread unchecked, the disproportions in the national economy became increasingly serious, the effect of economic activities became lower and lower and the whole national economy suffered great damage. It was inevitable that economic practice suffered serious setbacks when economic science was trampled underfoot.

Third, the smashing of the "gang of four" ushered in the spring of a hundred flowers blossoming in a riot of color in economic science.

During the 2 years of 1977 and 1978, the economic circles systematically criticized the economic absurdities of the "gang of four."

They began at the very start to criticize the criticism of the theory of "unique importance of productive forces" of the "gang of four," pointed out that the "gang of four" was diametrically opposed to historical materialism and revived the Marxist viewpoint that productive forces play an ultimately decisive role in the development of society.

Then they criticized the defamation of the socialist principle of distribution according to labor by the "gang of four," reaffirmed that the principle of distribution according to labor is a fundamental socialist principle. The nationwide symposium held four times during 1977 to 1978 played a promoting role in boldly and forcefully implementing the principle of distribution according to labor in reviving piece rate wages and the system of bonuses and in materially arousing the enthusiasm of the working people for socialism.

They criticized the vilification of socialist commodity production and pointed out that it was necessary to vigorously develop socialist commodity production and commodity exchange, and importance should be attached to the role of the law of value in socialist economic development.

They criticized the crimes of the "gang of four" for sabotaging the socialist economy by brandishing the big stick of "putting interests in command."

They criticized the absurdities of the "gang of four" in slandering socialist business accounting and negating the rules and regulations of enterprises, and so on.

With the intensification of the criticism of the "gang of four," the economic circles were gradually freed from the spiritual shackles which had fettered them for many years. The discussion of practice being the sole criterion in testing truth played a great promoting role in emancipating the mind. The emancipation of the mind caused people to seriously study and ponder over the reasons in the guiding thinking for the repeated shortcomings and mistakings in China's socialist construction, and required them to understand anew the socialist economy and economic system and explore the socialist economic formula and the correct path of socialist modernization suited to China's national condition. We have realized that the problems of the rural economic policies and the backwardness of enterprise management are two weak links in China's socialist economy, thus intensifying the study in these fields. During this period, we started the investigation of the economic conditions of other countries and academic exchanges with them, deepened our understanding of the world, broadened our horizons and promoted the study of the world economy.

The end of 1978, after the 3d plenary session of the 11th CCP Central Committee, inspired by the CCP's spirit of emancipating the mind, using our brains, seeking truth from facts and taking practice as the criterion, the economic circles seriously studied the experiences and lessons in China's 30 years of socialist construction and carried out the principle of letting a hundred schools of thought contend. The eight-character policy of "readjusting, restructuring, reorganization and upgrading" formulated by the CCP Central Committee in April, 1979 clearly showed the economic circles important research tasks. In integrating with the formulation of long-term plans for social science, many economic scholars gave consideration to the intensive demands for the development of economic science and the questions of all sectors which are to be studied, of which the most important are such questions as the reform of the economic system, the rationalization of the structure of the national economy and economic ties with other countries. These questions in fact involve every aspect of the socialist economy and every realm of socialist political economics.

After the financial and economic commission under the state council organized the vast numbers of economic theoretical workers and economic workers to conduct investigations and study of the economic system, economic structure, the importation of technology, economic theories and economic means, the economic circles became more active. They published large numbers of theses of great value. Many people dared to break through traditional concepts, broaden their field of vision, studied new conditions and new problems, boldly advanced various assumptions for reforming the economic system and readjusting the economic structure. They not only flourished and developed the economic sciences but also played a propulsive role in the practice of socialist modernization through participation in the making of decisions in various ways.

Since the 3d plenary session of the 11th CCP Central Committee, the economic circles have studied the following subjects:

On the aim of socialist production. This question concerns the direction of China's socialist economic construction and also a problem in our economic work that has not been solved satisfactorily for a long time. Beginning from September and October 1979 to the end of 1980, Beijing and some provinces, municipalities and autonomous regions held many symposiums and discussions and published many articles in newspapers and magazines. This has aroused widespread attention. It was pointed out in the discussion that the long-term and short-term plans and arrangements of the national economy and the rationalization of the industrial structure must be subordinated first of all to the aim of socialist construction. The discussion held that to profoundly study the aim of socialist construction, it was necessary to separately study such questions as the aim of social production and of enterprise production, the ultimate aim and intermediate aim as well as the basic aim and direct aim, to study the objectivity of the aim of socialist production and the economic mechanism for realizing the aim of socialist production, and so on. This discussion closely integrated the historical experiences of China's socialist construction with the current actual conditions. This marks a further understanding of the socialist basic economic law.

On the form of the system of ownership. The economists pointed out that to establish and develop the relations of production which promote the development of the productive forces, under China's productive forces at the present stage, we must allow the coexistence of diversified economic sectors and various forms of the diversified economy under the prerequisite that the system of public ownership of the means of production holds a dominant position; realize the important significance of the collective economy in the cities and towns in the socialist construction at the present stage; acknowledge that the "transition from poverty" runs entirely counter to the objective economic laws; introduce various forms of the agricultural system of assigning responsibility by linking remuneration with output including the system of fixing output quotas for individual households and the system of peasant households assuming responsibility for task completion in accordance with various conditions; and, in the system of ownership, relax policies and appropriately expand the private plots for commune members.

On socialist commodity production and the law of value. The economic circles held a national discussion in April, 1979 in Wuxi. This vigorously pushed the study and discussion of this question forward. A lot of economic scientific workers made a relatively thorough study of the objective inevitability of the existence of socialist commodity production and commodity exchange in socialist society, explored the relations between planning and the market and deliberated on the extensive use of the market mechanism in a socialist planned economy, affirmed that socialist enterprises were relatively independent commodity producers, held that it was necessary to attach great importance to the role of the law of value and to the implementation of the principle of material interests, and so on. The discussion on this question has played a promoting role in the reform of China's economic management system.

On the economic system and socialist economic formula. This is, in essence, a matter of choosing the concrete form and structure of the system of ownership. Quite a few economists have pointed out that the socialist one is a planned economy but it is necessary for the planned economy which preserves the relations between commodity and money to use the market mechanism and vigorously develop socialist commodity production and commodity exchange. To establish the corresponding economic system, it is necessary to change the highly concentrated state policymaking system combining the state, the economic units and the laborers, change the practice of relying mainly on the party and government organizations and administrative measures into that of relying mainly on the economic units, economic measures and laws and regulations in managing the economy. The current reform of the economic system should proceed from the expansion of the decision-making power of enterprises, and so forth.

On the economic structure. All of us hold that there are a lot of imperfections in China's economic structure and it is necessary to readjust and reform it. The rational economic structure must be a structure which suits China's national condition, enables us to give full play to China's strongpoints and ensures the harmonious development of the national economy. We must no longer continue to one-sidedly develop heavy industry and particularly the iron and steel industry and one-sidedly develop grain production as we did in the past. In the light of China's characteristics of being huge in population and abundant in manpower, we must adopt more applicable technology, set up more medium and small-scale enterprises and develop more labor-intensive trades, accelerate the development of agriculture, the light and textile industries, the energy industry, communications and transportation, the building material industry, building industry and culture, education, science, health work, and so forth.

On the development strategy for the economy and society, including the choice of the direction and aim of the long-term development of the national economy. Many comrades hold that in arranging medium and long-term state planning, it is necessary for socialist construction to proceed from the end products and to study the development strategy for the economy which suits China's national condition so as to ensure continuous, stable and high-speed economic growth and the continuous and practical improvement of the people's livelihood on the basis of developing production.

In addition, in accordance with the characteristics of local conditions, the economic theoretical and practical workers of various localities made a comprehensive study of the regional economic structure and economic system and achieved quite a few research findings. They also made a significant study of the regional economy of the national minorities.

During this period, the questions discussed by the economic circles were numerous. We are unable to cite them here one by one. It must be pointed out that all these studies and discussions are needed by China's socialist economic construction.

Along with the shift of the focus of work of the country and the party to socialist modernization, numerous new situations and new problems in economic life have emerged. So it is necessary to study the various branches of economic science. We have done a lot of work, held many academic discussions and made progress in varying degrees in the economic branches with which China is relatively familiar including theoretical, historical, departmental, methodical and frontier economics such as political economics, the science of national economic planning, history of Chinese and foreign economic thought, history of Chinese and foreign economies, world economics, technological economics, industrial economics, agricultural economics (including the animal husbandry economy, fishery economy and forestry economy), finance, commercial economics, money and banking, international trade, capital construction and building economics, transport economics, labor economics, statistics and accounting. Along with this, some new branches of economics such as productive forces economics, population economics, territorial economics, national minority regional economics, environmental and ecological economics, municipal economics, educational economics, health economics, consumption economics, science economics, tourist economics, quantitative economics, comparative economics and development economics have emerged as the times require. Various ecnomic organizations including various research organizations, associations and institutes, and various economic theoretical periodicals have sprung up like mushrooms. The economic exchanges with other countries continue to expand.

In sum, since the 3d plenary session of the 11th CCP Central Committee, the economic circles have vigorously developed on an unprecedented scale. We firmly believe that China's economic science will undoubtedly play an increasingly important role in socialist modernization.

2. Economic Science Should Anticipate the Modernization Program

There is a world of difference between the task of Marxist economic science under socialism and that in capitalist society. This is because under the capitalist system, the working people are not the masters of the economy and the aim of our study of the capitalist economy is to draw a scientific conclusion that capitalism is doomed and socialism is bound to triumph and to lay a firm theoretical foundation for socialist revolution. Socialism was founded by the people themselves in their hundreds and millions. In the history of mankind, socialism is the first society which was established conscientiously in accordance with certtain scientific theories. Under the socialist system, the working people themselves are the masters of the economy and shoulder the responsibility for developing and managing the socialist economy. The aim of the study of economics is not to confine ourselves to understanding the historical tendency of social development and understanding the superiority of the socialist system but to help us further bring to light the various concrete laws of socialist economic movement and apply the knowledge gained in these fields to the practice of socialist economic construction. To offer scientific bases for formulating a correct development strategy for the economy, economic policies, plans and measures and the administrative and managerial methods, and to promote socialist modernization. If we were not armed with Marxist economic theory, we would have been unable to establish the socialist economy. The more socialist construction is conscientiously carried out under the guidance of correct theory, the more effective it will be. The theoretical principles and experience have shown that economic science should anticipate socialist construction and suit the increasingly high requirements demanded by practice.

The 3d plenary session of the 11th CCP Central Committee held in December, 1978, decided to shift the focus of work of the CCP and the country to modernization with economic construction as the center. This marks the beginning of China's new period of socialist construction. The "resolution on certain questions in the history of our party since the founding of the PRC" stipulates that the objective of the CCP's struggle in the new historical period is to turn China step by step into a powerful socialist country with modern agriculture, industry, national defense and science and technology and with a high level of democracy and culture. In a big oriental country like ours which has a population of 1 billion, the carrying out of socialist modernization is a grand cause without parallel in history. It needs the guidance of Marxist theory and the development of the different social and natural sciences. Now that economic construction is the center of modernization, it is only natural to place economic science in a very important position.

However, it must be acknowledged that though China's economic science has developed on a relatively big scale since the smashing of the "gang of four," it is still in general considerably backward. Under these circumstances, we must rouse ourselves to catch up and exert the greatest efforts to develop our economic sciences so as to enable it to really anticipate socialist modernization.

China's socialist modernization poses complex and diverse tasks for economic science. The complexity and diversity of the tasks stem from the complexity and diversity of economic life. In this respect there are both the complexity of the economic process (including the various links of production, exchange, distribution and consumption and various sectors of the national economy) and the complexity of the economic factors (including the essential material factor and human factor of productive forces, the natural factor, the social factor and historical factor), both the complexity brought about by the economic backwardness of a big oriental country like China and its unbalanced development and the complexity of the multifarious economic ties with foreign countries and both the complexity of the economic fields themselves (including handling well the relations of economic interests between various localities, departments and units and between this part and that part of people) and the complexity of politics and culture which are related to economics and other social relations. In this respect, it is necessary not only to solve the current economic problems but also to give consideration to the long-term economic problems. In order to solve these problems, it is necessary to have a powerful contingent of economic scientific workers, and the concerted efforts and cooperation of specialists from all sides and quarters, to conduct large quantities of investigations, to grasp rich data and to engage in making thorough and painstaking analysis and study. These efforts will undoubtedly help economic science and the various branches develop in depth and generally rise to a new height. Economic science is a science of enormous scope and with numerous branches. The problems that demand study are numerous and it will not do to neglect the study of any aspect. We are unable to cite them here one by one. In the light of some problems that demand the most urgent solution in socialist construction, I am going to touch on the development of the corresponding branches of economics.

First of all, we must enhance the study of the various branches related to the perfection of the structure of the system of ownership at the present socialist stage and the economic management system.

Over a considerable period of time, we have held that only the soviet formula in the period of Stalin was the mode formula of the socialist relations of production. After 1958, influenced by such erroneous ideas as "the bigger the collective unit and the higher the level of public ownership, the better," "the expansion of the relations between commodity and money and the development of socialist construction being mutually exclusive" in "doing away with the bourgeois rights," in the structure of the relations of production, we deviated from the Marxist course that the relations of production must be conducive to the development of the productive forces. In the economic system, these erroneous ideas led to the overcentralization of policymaking power and to the tendency to negate the relative independence of enterprises, the practice of "eating out of a big pot" and of excluding the market mechanism. This brought about the negative results of the enthusiasm of the working people being restrained, the enterprise and local management organs lacking vitality, and the economic activities and the superiority of the socialist system being unable to be brought into play. This is the objective basis for our carrying out the reform of the economic management system.

In order to create the concrete form of the relations of production which suits the productive forces and is easy to continue to advance, it is necessary for us to do a lot of research work in theoretical economics and applied economics. For instance, the question, under what conditions of productive forces and other conditions is it suitable to adopt which kind of economic forms and economic means and how will they develop, is the major task of political economics and its corresponding departmental economics. The improvement of the structure of the system of ownership and that of the concrete management system of various economic sectors and of the system of distribution must take the development of political economics and departmental economics such as agricultural economics, industrial economics, capital construction economics and commercial economics as a prerequisite. The reform of the management system of the national economy is a great task that needs the comprehensive results of concerted efforts of various branches. In this respect, the study by comparison of the theories of various socialist countries on the reform of the economic system, the study by comparison of the practices of reforming the economic system of various socialist countries and the study by comparison of the theories of foreign economic scholars on socialist economic formula are of great significance. We are resolved to offer a firm theoretical basis for perfecting China's socialist relations of production. At the same time, with the carrying out of the reform of the economic management system and the strengthening of planned leadership over the whole national economy, planning science should be developed to the stage of precision, and due importance should be attached to quantitative economics and it should be developed to suit China's specific conditions. On the one hand, with the expansion of the role of the market mechanism and the development of socialist commodity production and commodity exchange, the application of various money levers and the forecasting of economic conditions are of vital significance in the normal movement of China's national economic system. In accordance with this, finance, currency and banking studies, statistics, theory of social bookkeeping theory of regulation, theory of the market, theory of price and theory of economic forecasting should be developed in a relatively big way.

Second, we must strengthen the study of various branches related to the definition of China's development strategy for the economy.

During the past few years, instead of proceeding from China's national condition and deciding our own strategical objective and the ways to reach it in accordance with Marxist basic principles. We used to take the total output value and even the high-speed growth of some heavy industrial products as the main strategic objective. This hindered the normal carrying out of socialist expanded reproduction and the full accomplishment of the aim of socialist production and at the same time brought about a conspicuous decrease in the economic effect of the whole national economy. Since the 3d plenary session of the 11th CCP Central Committee, we have had a gradual understanding of the past mistakes in the development strategy and have formulated the principle of striving to reach the goal of modernization systematically and in stages, according to the national condition and resources of the country. How to correctly realize this principle, whether in the definition of the strategic objective of the national economy or in the choice of the path to realize this objective, there are large quantities of work in theoretical analysis and scientific deliberation for economic science to do.

For instance, in order to thrash out China's national condition, it is first of all necessary to conduct a thorough study of the conditions of China's natural resources and economic resources and the possibility of utilizing them. To carry out this study, the establishment and development of such branches as territorial economics and population economics are indispensable. Take another example, in order to correctly choose the strategic objective of China's social economic development, it is necessary to thoroughly analyze the aim of socialist production, sum up the experience and lessons in our choice of strategic objective and make analysis and comparison of the various strategic objectives of other countries. Furthermore, to decide the path for developing China's economy and adopt the steps and measures of policy, we have to thoroughly study the theories of reproduction and the productive forces and make various technological and economic deliberations. In sum, the formulation of scientific regulation for the general objective of China's modernization and the concrete targets at the various stages and the making of the top choice of China's industrial structure, product mix, technological structure and the formula for consumption, await the concerted efforts of political economics and such branches as development economics, ecological economics, technological economics and consumption economics.

It must still be pointed out that various operation sciences should be developed rapidly. For a considerably long period of time in the past, under the influence of the guiding ideology of regarding the socialist economy as a natural economy and the management system in which the policymaking power was excessively centered on the administrative organs and the relative independence of enterprises and the market mechanism were excluded, the fairly developed branches of modern economic science--various operational sciences and managerial sciences--cannot very well avoid being neglected. Under these circumstances, the poor economic effect of enterprises and the whole social economy and the amazing waste have become inevitable. With the strengthening of China's socialist economy and the further socialization of production and the increasingly complicated relations between production and exchange, the demands for properly solving the various problems of operation and management will be higher. This makes us necessarily adopt more powerful measures to revive and develop various branches of operation and management and departmental economics and makes us intensively apply the methods of modern mathematics and calculating technology to solving various questions of operation and management. In the study of these questions, the central issue is how to improve the economic effect. Therefore, with regard to the theory of the socialist economic effect including the yardstick for measuring the economic effect and the quota system, and the ways and measures for achieving the best effect, great efforts must be made to study them.

For economic science to anticipate socialist modernization, it is not only necessary to develop the above-mentioned various applied economic sciences but also to enhance the study of basic theories including the study of ancient and foreign basic theories and the branches of rudimentary theories. Practice has proved that it is a shortsighted approach to attach importance only to the study of theoretical application to the neglect of the study of basic theories. We must set up high aims and lofty aspirations and write scientific theses and compile teaching materials concerning the part of socialism of political economy in not too long a period of time through the study of basic theories and the major theoretical problems of socialist modernization and through the summarization of the historical experience and lessons of Chinese and foreign socialist construction.

It must also be realized that China's economy today was developed from China's economy in the past. Without a good understanding of history, it is impossible to have a thorough understanding of what is going on today. The study of the Chinese economic history and Chinese history of economic thought is the foundation for understanding China's present economic condition. Meanwhile, under the conditions of modern times, no country can exist in isolation by walling itself off from other countries in the world. Although China is a big country, international economic ties are still of great significance to us. It is beneficial for China's socialist construction to develop these ties. Thus it is very necessary to study the international economy. Moreover, the existence and development of the socialist economy is an international phenomenon, so we must not judge this phenomenon by a standard of closing the country to international intercourse and adopt an attitude of looking at the sky from the bottom of a well towards it. To develop Marxist economics, we must strengthen the study of Chinese and foreign history and present conditions and be good at absorbing the practical experience and theoretical results of other countries. For this reason, the development of political economics, world economics, Chinese and foreign economic history and the history of economic thought will be the firm foundation of the prosperity of economic science as a whole.

3. Strive to Make Contributions in Fulfilling the Tasks of Economic Construction During the Readjustment Period

From a long-term point of view, economic science must not only anticipate modernization but also serve the present practical economic work.

At present, China's national economy is in a period of readjustment. Since the 3d plenary session of the 11th CCP Central Committee, the development of China's economic situation is, in general, very fine. In particular the rural economic situation is better than expected, because various forms of the system of assigning responsibility by linking remuneration with output have been introduced and various economic policies suited to the rural conditions implemented. Agriculture is the foundation of the national economy. The rapid development of the rural economy has a decisive impact on the development of the whole national economy. Since the implementation of the principle of further readjusting the national economy, we have again made new achievements. The industrial structure is undergoing a profound change, the light and textile industries are further growing at a rapid speed, and the needs of the people have been satisfied better compared with the situation in the past. The heavy industrial products are more suited to popular taste. The momentum of price hikes has been controlled and the market continues to flourish. Even though many provinces and areas were hit by natural disasters this year, China's national economy as a whole has advanced as predicted by the report delivered by the leading comrade of the state council in March this year at the meeting of the standing committee of the National People's Congress. Along with this, we must also acknowledge that there are quite a few problems in China's present economy: The speed of development of industrial production was a little slow and particularly that of heavy industry, the economic returns were relatively poor, the enterprises which incurred financial deficits increased in number in the first half of the year, the interest rate decreased somewhat, the management of some enterprises has not been put on the right track, and violations of financial discipline and serious cases of waste frequently occurred.

China will need a longer period of time to readjust its national economy, aiming at overcoming the serious disproportions in the national economy caused by historical reasons and at putting an end to the extremely irrational condition of the national economic structure so as to gain a firm position of advance in further developing its modern socialist economy. In the various efforts to fulfill the tasks during the readjustment period, the most important thing is to enthusiastically develop production, thus enabling the national economy to grow at a certain speed. It is very obvious that only when agricultural and industrial production increase at a certain speed, can we have the material basis for solving the various problems that have arisen during the readjustment period. At present the people all over the country are rousing themselves and struggling for it. Of course, we must seek truth from facts, do things within the limits of our capabilities, and try our best to advance steadily. We hope that the pace of advance in the future will be quicker than it is now.

Under these circumstances, it is a very urgent task for economic science to study well the current economic problems and make positive contributions in putting the eight-character policy of "readjusting, restructuring, reorganization and upgrading" into effect and in developing production. The economic integrated federation and its members must exert their efforts in this respect. For example, there are the following questions that merit our serious study.

First, on the question of operation. At present, owing to readjustment, the curtailment of the scope of capital construction and the reform of the industrial structure, quite a few enterprises and particularly heavy industrial enterprises are operating below their capacity and their abilities have not been brought into play. Therefore how to improve operations, open up new prospects for production and produce marketable goods and give play to the production potentials of their units have become an urgent problem of the aforesaid enterprises. Even if the enterprises operated at full capacity, they should readjust the product mix according to need, do a good job in the renewal and replacement of products, raise product quality, develop new products and improve the enterprise operational forecasting and decision making. Not only the enterprises but also the departments and localities should pay attention to the effective utilization of manpower, material resource, natural resources and other economic conditions so as to maximize economic effect. For a long period of time, we have paid insufficient attention to operation and seldom studied it. This state of affairs must be speedily changed. On the one hand, the management organs of the enterprises, departments and localities should study this question of operation, and on the other hand, the economic theoretical workers should also energetically participate in the study, conduct investigation and study of the market and resources and make technological and economic deliberations in order to improve operational skills.

Second, on the rectification of enterprises. At present, the problems of quite a few enterprises are inseparable from mismanagement. The basic work of some enterprises at present is not solid. Their original records, statistics, measurement figures, tests, drawing and quotas should be reorganized and strengthened. Quite a few enterprises have not revived and established sound responsibility systems and business accounting systems. The leading bodies of some enterprises are not sufficiently sound. Up to this day, the tax and profit yielded by every 100 yuan's worth of funds in state-run enterprises is far from reaching the highest level in history. We must study well various problems related to the reorganization of enterprises, study how to establish different forms of responsibility system in accordance with different conditions, give play to the potentials of the existing enterprises, economize on energy and on the consumption of raw materials, reduce costs, raise labor productivity, put an end to losses in running enterprises, increase profits, improve the economic effect and promote readjustment and reform through rectification.

Third, on making economic decision making scientific. The large quantities of waste and losses in China's economic construction in the past are inseparable from our neglect of strict scientific deliberations of various economic plans, economic policies and measures. At present, we must develop the study of policymaking procedures and methods, make scientific deliberations of various economic decisions and put our decisions on a firm scientific foundation both economically and technically. For instance, together with the natural scientific workers and engineering and technical specialists, the economic scientific workers must meticulously carry out feasibility analysis and study of capital construction projects and especially the major projects among them. They must serve well as the staff officers of the policymaking organs.

Fourth, on the improvement of planning management. There is enormous potential in China's economy. The work of planning management demands urgent reinforcement. Recently, due to various reasons, large quantities of productive force were left unused, large amounts of materials kept too long in stock and manpower not given full play in some industrial branches and particularly such heavy industrial branches as metallurgical and machine building branches. This is the greatest waste in our economic work. If this problem is not solved, it will continue to hinder the speed of economic growth, the increase in state financial revenue and the advance of the whole economic movement with great vitality. How to further enliven the economy and put the idle manpower and materials into the economic turnover is a task confronting us that needs serious study. For this reason, we must reinforce the study of the questions concerning national economic planning and comprehensive balance, study how to better bring the role of such economic levers as finance, credit, price and taxation into play and study how to do well the work of various economic forecasts.

Fifth, on the question of economic policy. The rapid improvement of the rural situation over the past few years is, first of all, the result of suitable economic policies. Therefore, in the various aspects of economic work, it is necessary to formulate policies on a scientific basis which suit the actual conditions. This is a matter of great importance. The tasks of economic science are to offer theoretical bases for formulating and perfecting the various economic decisions on the basis of large amounts of investigation and study. In order to do a good job of readjustment, at present we must stress the need to study how to improve the policies of finance, credit, taxation, wages and rewards, price, foreign trade, energy and technology and to advance solutions and proposals. Economic science must not only study the principles for working out economic policies but also study the concrete problems that have arisen in the process of enforcing policies. For instance, with regard to price policy, it is necessary to study the detailed prices for various products and labor and to study the most rational prices under certain economic conditions. These are complex matters that must be solved with concentrated efforts.

Sixth, on the reform of the economic system. In order to fulfill the tasks of economic construction during the readjustment period, it is necessary to continue to carry out the reform of the economic system. Economic science must study the question of promoting readjustment with reform, study the irrational elements in the economic system which seriously hinder the fulfillment of the tasks of readjustment, study what measures we should take and what conditions we should create to reform these irrational elements and study the relationship between the partial reform carried out in the light of readjustment and the all-round reform of the economic structure so as to make the former conducive to the latter.

Seventh, on the rationalization of the national economic structure. In recent years, the economic circles have put forth some important opinions and suggestions on structural rationalization. For instance, they have made serious analysis of the negative effects brought about by the industrial structure which took steel as the key link and was practiced for a long time. However, we have not thoroughly studied the question of economic structure. We must further make a profound analysis of the departmental structure and product mix to which we have given a lot of consideration. Some formulations must be made more precise. We must strengthen the study of some branches (of the economy) which are emphatically to be developed presently (such as the food industry, textile industry, consumer durables industry, fuel power industry, communications and transportation, forestry, animal husbandry and aquatic products industry) and the machine-building industry which is needed in developing these branches. The regional structure, enterprise scope structure and technological structure which we seldom discussed in the past have all the more to be studied.

Eighth, on economic ties with other countries. Economic science must sum up the rich experiences in developing economic ties with other countries over the past few years. Since the smashing of the "gang of four," the policy of walling the country off from international exchanges which China had pursued for a long time has been resolutely discarded. It is historically inevitable that we will expand economic exchanges with foreign countries and develop various forms of economic ties for the purpose of introducing advanced technology from abroad and appropriately using foreign capital. But whether in practice or in theory, our present level is not commensurate with practical needs. This requires us to sum up experience well and achieve scientific results in economic research.

Ninth, on theory. Besides the above-mentioned questions concerning theory, it is necessary to organize force to firmly grasp the study of many other questions concerning theory. The theories of reproduction, circulation and investment are instances in this respect. On the one hand, we must fully make use of existing resources and revitalize the economy, and on the other hand, we must keep a balance between financial revenue and expenditure, stabilize prices and avoid repeating the errors of overextending the scope of capital construction. We must thoroughly study the laws governing money movement and material movement and calculate their balance factor and time factor. For this reason, we must make not only qualitative analysis but also quantitative analysis.

What I have mentioned above is just the direction of some of what we should concentrate our energies and efforts to study. They cannot embrace all the questions. It is hoped that the various institutes, associations, research organizations and their members will set the tasks of study and make intensive studies. All these studies are for one objective--to enable China's national economy to smoothly step out of the readjustment period and march ahead along the correct path of socialist modernization suited to China's conditions which the CCP has gradually mapped out.

4. Rouse the Spirit and Strive to Develop Economic Science

China's various socialist construction projects must be based on a firm scientific foundation. Of these, the case of economic science is particularly important. Therefore, we in the economic circles must rouse ourselves, try our best to develop economic science and help economic sciences to better serve our socialist modernization.

First, in the study of economic theory, it is imperative to uphold Marxism-Leninism-Mao Zedong thought.

Historical experience and lessons have told us that in order to give play to the role of our theoretical research work in socialist modernization, it is imperative to uphold Marxism-Leninism-Mao Zedong thought as the guidline. The basic principles of Marxism-Leninism-Mao Zedong thought are the guide for us to engage in the study of economic science. We must not only systematically study the works of Marx, Engels, Lenin, Stalin and Mao Zedong and particularly such works as "Das Kapital" but also really understand and learn to apply them. Otherwise, our study and research will go astray. Adhering to this point does not mean not continuing to develop our economic science. Comrade Mao Zedong once made statements containing the following ideas: The communists of any country and the ideological circles of the proletariat of any country must create new theories, write new works and give rise to their own theorists. It will not do to rely solely on old things at any time. Proceeding in all cases from reality is the living soul of Marxism-Leninism-Mao Zedong thought. We must use dialectical materialism and historical materialism to break through ossified and semi-ossified thinking, to free ourselves completely and thoroughly from the shackles of dogmatism, to earnestly study the objective process of the movement and the development of the socialist economy and to specially explore the unique form of the socialist economic laws that function in our country through the zigzag road we have traversed and to establish the socialist economic system so as to better serve socialist modernization on the basis of summing up Chinese and foreign practical experience. Fundamentally speaking, bourgeois economics serves the capitalist system. We cannot take in what is philistine and unscientific in it, nor can we tolerate that which is unsuitable for our system. Of course, it cannot be denied that bourgeois economics also studies all socialized mass production and some laws governing commodity economy. We must attach certain importance to it. We must pay close attention to the history and present conditions of foreign economic theoretical research and in the light of China's national condition, critically assimilate its useful substance.

Second, it is imperative to enthusiastically implement Marxist principles and policies for developing science.

The policy of "letting a hundred flowers blossom and a hundred schools of thought contend" is a basic principle for allowing socialist culture to flourish and also a basic principle for promoting the development of economic science. In 1956, in accordance with the objective fact that there were various contradictions in socialist society and with the urgent demands for our country to rapidly develop its economy and culture, Comrade Mao Zedong advanced the "double hundred" policy. But owing to the obstructions from the "left" and the right, this policy was not implemented well. After the smashing of the "gang of four" and in particular after the 3d plenary session of the 11th CCP Central Committee, the movement to emancipate the mind was gradually carried on throughout the country, thus allowing the lively situation to emerge whereby "a hundred flowers blossomed and a hundred schools of thought contended." This has created a good atmosphere for the prosperity and development of economic science. In order to develop economic science, the movement to emancipate the mind must continue to develop in depth. Without the emancipation of the mind, it is hard to analyze the new situation, study new problems, put forth one's own opinions including constructive opinions and critical ones so as to solve problems well. We must have the theoretical courage to actively explore new problems and especially to study the major issues of overall importance which concern the vital interests of the party and the state. In scientific research, without thinking things out for oneself and without an atmosphere that is conducive to a free exchange of views, it is impossible to push scientific research forward. The question of whether the views are right or wrong must be judged through discussions and practice. Anyone who draws a conclusion on certain matters without going through discussions and practice will more often than not show that he lacks a thorough understanding of the complexity of the problems in economic science. Some problems seem to have been settled but in concrete practice they become complex. Therefore, in economic scientific research, there must be an atmosphere that is conducive to an earnest and free exchange of views on academic matters. In practicing criticism and self-criticism in the academic field, we aim at conducting an earnest and free discussion in which everyone can air different views and make criticism and can also make countercriticism. Conducting earnest and free discussions and bourgeois liberalization are two entirely different things, and they must not be lumped together. We must prevent bourgeois liberalization. The tendency of bourgeois liberalization must be seriously criticized. Bourgeois liberalization and the "leftist" trend of thought are obstructions to the conduct of earnest and free exchanges of views and must be eliminated. Integrating theory with practice, forging close links with the masses and practicing criticism and self-criticism are the three important and fine work styles of our party. They form an integral whole. Many erroneous ideas are often the result of not going deep among the masses, not delving deep into reality and not doing a good job in integrating theory with practice. Therefore, we, the economic theoretical workers, must not only attach importance to theory and earnestly study but also lay stress on reality and reinforce the work of investigation and study. Only in doing this, can we proceed in all cases from reality, uphold truth and rectify errors in the interests of the masses. Under the influence of "leftist" mistakes, we have always adopted the methods of launching political movements to solve the problems arising from erroneous thinking for a long period of time, thus giving some comrades a false impression that mentioning practicing criticism means that some campaigns will be launched. Criticism means discussion and analysis of different opinions and controversies. It must be realized that nurtured and educated for years by the CCP, the large numbers of economic theoretical workers are the valuable assets of socialist modernization and the force on which the CCP relies. Most of the different views in scientific research belong to matters of recognition as to whether or not they conform to objective reality. This can be solved only through social practice. The "resolution on certain questions in the history of our party since the founding of the PRC" points out that "we must correctly understand that there are diverse social contradictions in Chinese society which do not fall within the scope of class struggle and that methods other than class struggle must be used for their appropriate resolution." Upholding the four basic principles is in keeping with the policy of "letting a hundred schools of thought contend." In carrying out the policy of "letting a hundred schools of thought contend" and practicing normal criticism and self-criticism, it is imperative to follow the four basic principles. At the same time, we must not handle the different views and even erroneous ones in academic research in an over-simplified and crude way and especially oppose the practice supporting one kind of academic view and discriminate against another one by resorting to administrative means. This is an important experience of our implementation of the "double hundred" policy over the past two decades. Of course, words and deeds that disrupt socialist construction are matters of another nature. We must launch a necessary struggle against them.

Integrating theory with practice is the fine work style of our party and also the fundamental principle for developing economic science. Since the smashing of the "gang of four" and especially since the 3d plenary session of the 11th CCP Central Committee, the economic circles have adhered to this principle, thus playing a good role whether in the improvement of theoretical standards or in the promotion of practice. However, we must still pay attention to correcting theoretical study that departs from practice. The subjects of economic research must stem from reality. The economic theoretical workers must lay stress on investigation, take socialist modernization as a classroom, dare to practice, continuously study new situations and seek solutions to new problems and truly put into effect the practical principle of "not just listening to the higher ups and not just following what is said in books but paying attention to reality" which was put forth by Comrade Chen Yun early on when he was in Yunnan, and foster the scientific attitude of proceeding in all cases from reality. Of course, while paying attention to overcoming the tendency for theory to depart from practice, we must overcome the tendency of looking down on theoretical work. The "resolution on certain questions in the history of our party since the founding of the PRC" points out that one of the social and historical causes underlying the "great cultural revolution" which dragged on for as long as a decade and brought serious disasters to the CCP, the country and the people of all nationalities is that our party "was not fully prepared, either ideologically or in terms of scientific study, for the swift advent of the new-born socialist society and for socialist construction on a national scale." Thus stressing that "it was imperative for the whole party to engage in a more diligent study of Marxist theories, of the past and present in China and abroad, and of the different branches of the natural and social sciences." Engaging in a more diligent study of economic theory is of unique and important significance in this respect.

In the various branches of economic science and the different research subjects within the same branch, owing to the different objects and tasks of study, the ways of solving the question of integrating theory with practice are not necessarily the same. Turning the research findings into material results is a complicated process. It is hard to imagine that all research findings will play a direct role in practice. Some research findings will only play an indirect role in practice. In the past, under the influence of "leftist" mistakes, a large number of comrades who engaged in the study of basic theories and history were very often blamed for "departing from reality" and moving "from concept to concept." This was unjust.

One of the important issues in correctly implementing the principle of integrating theory with practice is that we, the economic scientific workers, must foster a strong sense of responsibility and resolve to serve socialist modernization with our own research findings. Of course, how far our research findings will play a propulsive and guiding role in practice depends on the scientific value of the research findings and must be tested by practice.

Third, to develop economic science, it is imperative to expand and improve the existing contingent of economic scientific workers and train large numbers of qualified economic scientific personnel.

In recent years, the ranks of our economic scientific workers has developed considerably, but this still cannot suit the needs of the arduous tasks of socialist modernization confronting us. This contingent of economic scientific workers is not only too small in quantity but also relatively low in quality. For instance, in terms of professional distribution, those who engage in the study of general economic theory are in the majority and very few people engage in the study of other branches. Many developing branches and the frontier branch are still nonexistent. The branches and the personnel are not fully integrated. Many economic scientific workers have a narrow range of knowledge and they have little understanding of the history, society and various production knowledge of their own country. To accomplish socialist modernization, it is necessary for economic scientific workers to understand advanced mathematics, modern science and technology and have practical knowledge of the modern economy, and the new achievements of study of different branches in other countries of which we have a very little understanding. They have poor knowledge of foreign languages, and in studying economic matters. They are used to laying stress on qualitative analysis to the neglect of quantitative analysis.

Therefore, it is a very pressing task to fill out and improve the existing rank of economic scientific workers so as to keep abreast of the demands of socialist modernization for economic science. We, the economic integrated federation, must play a deserved role in this respect. We must vigorously train a new force. The teaching of economics must be adapted to the requirements of socialist modernization, the teaching structure and the arrangement of specialized economics courses must be reformed, the range of knowledge of the students specializing in economics must be expanded and economic research, teaching and economic departments must be provided with qualified personnel of high quality.

In the study of economic science, there must be a division of work in science and at the same time the relations among the various branches must be strengthened. If everyone sticks to their narrow sphere and walls themself off from exchanges with others, then many problems cannot be better linked up. In addition, we must take into overall consideration and make arrangements for the development of economics throughout the country including the planning for the economic science of every region. We, the economic integrated federation, must do some useful work in this respect.

Fourth, it is imperative to develop various economic scientific service undertakings. The development of service undertakings is a result of the development of society of our time. Scientific service undertakings (including economic scientific service undertakings) are an important aspect of the various services. Besides their own tasks of study, economic science must do a good job in scientific service and serve socialist modernization with scientific conclusions, scientific know-how, scientific information and scientific methods in the fields of defining the results of economic policies, of offering economic information, data and advice, of training economic managerial personnel, of advancing rational solutions and suggestion and of making scientific deliberations of various technological measures and construction projects.

In socialist construction, it is an important task in the new historical conditions for us to strive to popularize economic scientific know-how. Only when the great majority of the people grasp economic scientific know-how, can our economic work be done better.

The tasks confronting us today are very arduous. The Chinese economic integrated federation is a scientific organization of a mass character. It holds itself responsible for connecting the economic circles, exchanging research findings, promoting academic research and popularizing economic science. We must energetically go into action, give full play to the strength of "integration," organize effective cooperation in the contents of study and personnel, train specialized personnel in different branches, open up new fields of discussion, actively participate in the various economic activities of the practical departments, offer scientific deliberations with full bases and develop economic service undertakings in a gradual way. Socialist modernization is not unconnected with economic science. We, the economic circles, must rouse ourselves, like climbing the topmost summit of Mount Taishan, brave hardships and dangers, march forward courageously and shoulder the great historical mission of developing economic science.

'JINGJI YANJIU' ON PRICE SUBSIDIES

HK280546 Beijing JINGJI YANJIU in Chinese No 10, 20 Oct 81 pp 78-81

[Article by Deng Huansong [6772 1360 2646] of the Sichuan Jiangjin Area Commodity Price Committee: "On the Duality of Price Subsidies and Ways of Reforming Them"]

[Text] Price subsidies represent an important economic policy of our country. To analyze and study the existing price subsidies system and to put forth realistic views on reforming this system will be of practical significance in improving the comprehensive equilibrium of our national economy and forming a rational price structure.

I

In our country, price subsidies have undergone a definite process of development. At the beginning, subsidies were given to enterprises which incurred losses. Later, they were gradually extended to the realms of circulation and consumption. The variety of subsidies was extended from the means of production to the means of livelihood. In our country, the amount of subsidies now accounts for over 20 per cent of total fiscal expenditures. Considering Sichuan as an example, subsidies disbursed from the fiscal funds of the central authorities are extended to grain, edible oils, coal sold on the market for daily consumption and other categories of commodities. Subsidies disbursed from local funds are extended to certain means of production, such as small chemical fertilizer plants, small iron and steel works, timber produced to support agriculture, pigskin products, raw silk for local sale, certain categories of agricultural machinery and equipment and so on, as well as to certain means of livelihood, such as vegetables, cotton for weaving, soap, pots for cooking rice, locks and so on. These subsidies are allocated to industrial enterprises and also commercial enterprises. Moreover, some subsidies are given to individual consumers. For example, in 1979, when the selling prices of 8 categories of non-staple foodstuffs were raised, price subsidies were given to workers.

In our country, the initiation and development of price subsidies have been related to certain political and economic conditions. Roughly speaking, such conditions can be categorized as follows:

The first category of political and economic conditions is that in the past, under the guidance of the principle for economic development called walking "on two legs," a number of the five categories of small industrial enterprises, such as small iron and steel works and small chemical fertilizer plants, appeared in various provinces. If we compare these "five categories of small" enterprises with large factories, their costs of production have been much higher than the average costs of the entire industries. If prices were raised on the basis of the individual enterprises' costs of production, then their products would have been unmarketable, and this would have been unfavorable to other enterprises' accounting work. Therefore, they have been subsidized. The price subsidies for small iron and steel works and small chemical fertilizer plants have thus continued to this today.

The second category of conditions is that subsidies have been given in compensation for losses due to low prices of industrial materials and raw materials and fuels. Take raw coal as an example. Today, the price of a ton of raw coal as it leaves the coal mine is even lower than that of a ton of firewood. The cost of excavating raw coal has been continuously rising because of the influence of natural conditions, but over the past 20 years the price of coal has very seldom been adjusted, resulting in losses for the whole industry. In 1979, after the prices of coal leaving the mines, including coal subject to centralized distribution and coal produced by the localities on their own behalf, had been raised by an average of 5 yuan per ton, two thirds of the enterprises still incurred losses. At present, the state's subsidies applied to coal are two-fold in nature. For one thing, the state continues to extend financial subsidies to those enterprises of the coal industry which suffer from losses. For another, it gives subsidies in compensation for losses due to the policy of raising the purchase price of coal to be sold by commercial units on the market for daily consumption without raising the market selling price.

The third category of conditions is that subsidies are given in compensations for losses due to increases in the prices of agricultural products or materials or raw materials without corresponding changes in the selling prices of products, that is, due to an inverted price structure in the links of circulation, with purchase prices exceeding selling prices. For example, with increases in the price of timber, the selling prices of timber for agricultural use and farm equipment have remained unchanged. With rises in the prices of tung oil and other oils extracted from wood, the producer price of soap has been correspondingly raised but the wholesale and retail prices charged by commercial units have remained unchanged. With rises in the purchase prices of grain and edible oils, their selling prices on the market have not changed. Fiscal subsidies are given to compensate for losses incurred in this way as a matter of policy.

The fourth category of conditions is that the state adopts a policy of keeping internal prices and external prices different for exported or imported commodities. Deficits arising in this way in external trade are covered by financial subsidies. In 1978, our country imported 6.96 million tons of iron ore at a cost of 54.8 yuan per ton. The Foreign Trade Ministry sold it at 45 yuan a ton to the enterprises. The price difference was 918 yuan per ton and the losses amounted to 68.20 million yuan. Then the Ministry of Finance subsidized the Foreign Trade Ministry to maintain domestic price stability.

The fifth category of conditions is that wages are low in our country, and in the light of this characteristic, financial subsidies are given to cover the losses due to low standard fees charged by those units responsible for medical and health services, health services for women and infants, and cultural and educational undertakings.

II

Judging from the political and economic conditions that give rise to price subsidies, the price subsidies system is closely related to our country's political and economic system. It is an integrated administrative and economic means adopted by the state to intervene in economic life and price movements. The aim of this means of intervention is to substitute price subsidies for price readjustments. By subsidizing the enterprises for their losses, the state checks the chain reaction effects of increases in the prices of related products so as to maintain the stability of planned prices and of the people's livelihood. This is a positive effect of price subsidies on our country's political and economic situation.

Our country pays relatively great attention to using the method of price subsidies as a substitute for price readjustments. Aside from reasons of the prevailing political and economic conditions and our economic system, there is also a theoretical cause: We do not attach importance to the regulatory roles of commodity and money relations and the law of value in the process of social reproduction, and we have been accustomed to using administrative intervention and regulation by planning mechanism to substitute for regulation by the market mechanism and the law of value. With the progress of economic readjustment and reform, the negative effects of the price subsidies system have become increasingly apparent. They can mainly be grouped under the following two categories.

1. The role of price as a lever to regulate the process of social reproduction has been weakened, resulting in an irrational pricing structure.

Although price subsidies can compensate the enterprises for their losses, they violate the requirements of the law of value by many respects. First, price subsidies cause the prices of commodities to deviate from their value, because financial subsidies constitute some artificial additions to prices. Whatever the amount of a subsidy, it makes it impossible for price to correctly represent value. The larger the amount of a subsidy, the greater will be the deviation of price from value. The longer the time during which a subsidy is applied, the longer will also be the time during which price deviates from value. In our country, the price of coal has been lower than its value for many years, without being readjusted. A reason is that the regulatory role of price as a lever has been neglected. For many years, some enterprises have depended on financial subsidies to keep up production. Consequently, the price structure has been irrational, with fuel prices remaining low and the prices of processed industrial products remaining high. This is surely one reason why we have been unable to boost the coal industry. Second, because subsidies cause price to deviate from value, the profit levels and operation results of various enterprises and various trades cannot be correctly assessed and reflected. Third, the regulation by price as a lever in the rational allocation of resources is weakened. It has been mentioned that the import price of iron ore is high but its domestic selling price is low, with the losses borne by the state. The enterprises scramble to use the imported iron ore. This is disadvantageous to promoting the opening up and utilization of our country's resources and to economizing on the use of foreign exchange. Fourth, financial subsidies tend to protect the backward enterprises and are disadvantageous to promoting technological advance and launching competition. For example, the low price of coal is unfavorable to encouraging the processing enterprises to economize on energy resources and undertake technological transformation for improving the energy consumption pattern. Practice has proved that the protracted use of financial subsidies to maintain the stability of planned prices will prevent us from building a rational economic structure and economic system.

2. The price subsidies system is disadvantageous to the comprehensive equilibrium of the national economy and to price stability.

Price subsidies hamper the attainment of comprehensive equilibrium. This finds concentrated expression in the fact that price subsidies are unfavorable to the attainment of equilibrium between fiscal revenue and expenditure and to the coordination of the proportional relationship between accumulation and consumption. Price subsidies are in contradiction to equilibrium between fiscal revenue and expenditure, because they are governed by different laws. Price subsidies have the following characteristics: they are integrated with the economic interests of the enterprises and the consumers; it is easy to increase or introduce or abolish them; and moreover, subsidies are integrated with production, circulation and consumption, so that even if the scope and criteria of subsidies remain unchanged, the larger the quantities of commodities purchased and the larger the volume of consumption, the larger will be the amount of subsidies and the greater will be the strain on the equilibrium between fiscal revenue and expenditure. In the Jiangjin area of Sichuan Province, in compliance with instructions of the central and provincial authorities, the purchase prices of timber, raw coal and agricultural products have been raised over the past year. Price subsidies have been greatly increased to stabilize the market selling prices of related products. In 1979, subsidies were extended to only 9 categories of products and the total amount of subsidies was 28.23 million yuan, accounting for 19 percent of that year's total fiscal expenditure of 147.37 million yuan. In 1980, the subsidies were extended to 18 categories of products, with the amount of subsidies increasing to 33.88 million yuan, accounting for 24 percent of that year's fiscal expenditure of 140.67 million yuan. In 1981, subsidies are still extended to 18 categories of products. Because of economic readjustment, the budgetary fiscal expenditure is reduced to 95.06 million yuan and the subsidies will be reduced to 30.06 million yuan. The reduced subsidies will account for 31 percent of the budgetary fiscal expenditure. The figures above have not yet included subsidies to foreign trade and medical and health units for covering their losses as well as price subsidies to workers for nonstaple foods.

Fiscal subsidies aggravate the irrationality of our pricing system. An irrational pricing system in turn enhances the continuous increase in price subsidies. The reasons are as follows. 1) The scissors differential between industrial and agricultural products is still relatively great. To strengthen agriculture, the foundation of our economy, and to develop the light and textile industries as quickly as possible, the state must continue to adhere to the policy of raising the purchase prices of the major agricultural products, such as grain, oils and cotton. At the same time, to enable the workers to enjoy a stable life, the state cannot yet correspondingly raise the selling prices. With the development of production, the increase in the quantities of products purchased, the increase in urban employment and the expansion of the work force, the state will increase its expenditure on price subsidies on the basic means of livelihood such as grain, oils, cotton, coal and so on as well as 8 categories of nonstaple foodstuffs. 2) Because of the needs of national economic development, we must not postpone for an overly long time changes in the prices of the means of production, with energy resources as the key items. In particular, raising the prices of coal and timber is a very urgent matter. With the increases in the producer prices of coal and timber, the state will increase its price subsidies on coal sold on the market for daily life and so on. 3) Import and export trade is expanding. Prices on international markets change frequently but domestic prices are relatively stable. Although the system of administration of foreign trade is becoming decentralized (responsibility being assigned to various departments and localities) subsidies for covering losses due to price differences will follow a trend of increase irrespective of what departments or localities bear the losses. With the development of the above factors, even if the scope of subsidies does not expand, the proportion of price subsidies in the budgetary fiscal expenditure will increase. Therefore, we should pay attention to the question of controlling the proportion of price subsidies in budgetary expenditure. The growth in price subsidies must be ensured by budgetary fiscal expenditure. However, the amount of budgetary fiscal expenditure is governed by laws peculiar to itself. First, the amount of budgetary expenditure is under the constraint of the current year's revenue and the previous year's balance. There is an objective limit. The entire fiscal expenditure consists of expenditure in the nature of accumulation and expenditure in the nature of consumption. Judging from the ultimate aim, price subsidies amount to an expenditure in the nature of consumption. Under the condition that the fiscal expenditure in a given year is a fixed amount, if the proportion of price subsidies rises, the proportion of other categories of expenditures will inevitably fall. Thus, an overly large proportion of price subsidies in the budgetary fiscal expenditure will inevitably displace other categories of expenditures and will hinder the achievement of a rational and well-balanced proportional relationship between accumulation and consumption.

Moreover, we should note that there must be some minimum limits, the attainment of which must be ensured by the budget, for price subsidies and other categories of fiscal expenditures. If the financial budget fails to provide for adequate price subsidies, the prices of some products--products whose prices must be kept stable by means of subsidies--will rise. On the contrary, if the minimum needs represented by other consumption and accumulation expenditures cannot be met, shortages in the relevant aspects of economic life will occur. When these expenditures, just as price subsidies, must increase and must not be reduced, a deficit financial budget must be made and consequently inflation and increases in commodity prices will be unavoidable. Then, because price subsidies expand and things happen in a way contrary to the aim of stabilizing commodity prices, commodity prices will consequently be unstable. Therefore, we should now raise the question of preventing the expansion of price subsidies. Steadily and with vision, we must reform the price subsidies system, exploit favorable conditions and avoid unfavorable conditions, and guard against being caught in a "dilemma" of failing to make both ends meet.

III

To sum up the above discussion: We should take controlling and reducing the proportion of price subsidies in the fiscal expenditures as some important substance of economic reform and price reform. In reforming the price subsidies system, we should follow this principle: for one thing, the reform must be conducive to achieving a proper balance in the proportion between accumulation and consumption and achieving comprehensive equilibrium in fiscal revenue and expenditure; and on the other hand, it must be conducive to the formation of a new economic system and a rational pricing system. If we are to attain this goal, we must not take hasty action now and immediately abolish price subsidies. Instead, we should gradually decrease price subsidies in a planned way. The following are the basic steps and paths we should take during the period of readjustment.

1. We should strictly control the scope of price subsidies. Currently, price subsidies account for about a quarter of our fiscal expenditure. We should take this proportion as a line of defense and prevent price subsidies from rising above this level. The appropriate measures are as follows. On one hand, the power of control over price must be centralized. The power of making decisions about national price subsidies must be centralized in the State Council. For another thing, in reducing price subsidies, we must proceed in an orderly way and step by step and coordinate such reduction with the measures and pace of economic readjustment and reform. For example, small iron and steel works and small chemical fertilizer plants incur losses because they produce products in small quantities and they consume large quantities of resources. Subsidies for covering such losses may be abolished if the enterprises undergo technological transformation, reorganization and rectification. Subsidies for covering the deficits of various institutes, such as medical and health institutes, may be cut back if they are run "in the way enterprises are run." Effective methods of control must be formulated to limit the subsidies arising from import and export trade. From now on, price subsidies drawn from fiscal expenditure should be applied mainly to several major commodities (such as grain, oils, vegetables and coal) which are closely related to the people's livelihood. Even in the case of these commodities which are important to the people's livelihood, the policy of an inverted price structure whereby purchase prices exceed selling prices should not be adhered to for a long time. If prices excessively deviate from value for an overly long time, then in the end "things will develop in the opposite direction when they become extreme." Therefore, we should create conditions for adopting the method of gradual price increases to reduce price subsidies of this nature.

2. The method of a combination of regulations by means of tax rates and regulation by means of pricing should be used to replace a part of our price subsidies. For example, in the light of different circumstances, the chain reaction effects caused by increases in the prices of coal, timber and agricultural products should be tackled by the method of a combination of regulation by tax rates and regulation by pricing. The market selling prices of some products should be raised if it is appropriate to do so. The method of regulation by means of tax rates should be applied to those products for which this method is appropriate. For example, in 1979, when the purchase price of cane sugar had been raised, the industrial and commercial tax rate applicable to machine-processed white sugar was lowered by the state from 40 percent to 30 percent, so that the market wholesale and retail prices of white sugar were kept stable.

3. Regulation by means of pricing must be integrated with measures of increasing the workers' wages and the residents' income. The state planning agencies must pay attention to changes every year in the price indices that reflect the workers' livelihood and the workers' income level. In working out the budgetary fiscal expenditure, due attention must be paid to both price readjustments and wage readjustments. We should make a gradual transition from relying mainly on administrative

means to relying mainly on economic means to stabilize commodity prices, and we must adopt the policy of coordinated increases in commodity prices and wages. Only thus can our economy have a way out. We must not follow the beaten track we have taken over the past 20 years, which is characterized by "no price changes, no wage increases and no economic vitality."

HEBEI COMPANY'S RESPONSIBILITY SYSTEM HAILED

OW150921 Beijing XINHUA Domestic Service in Chinese 0023 GMT 15 Nov 81

[XINHUA editor's note and investigation report No. 1: "Proceed from Setting an Average Advanced Work Quota--On Implementation of the Economic Responsibility System by the Handan Municipal No. 2 Construction Company"]

[Excerpts] Shijiazhuang, 15 Nov (XINHUA)--XINHUA editor's note: Hu Yaobang, chairman of the CCP Central Committee, recently visited the staff members and workers of the Handan Municipal No. 2 construction company of Hebei Province which is participating in Tangshan's reconstruction work. He praised the company as the most advanced construction unit in the entire country. Not long ago, XINHUA reporters also visited the construction company and thought that it indeed deserves its reputation.

The company, with some 2,200 staff members and workers, began working in Tangshan in early 1979. At the same time, it began to implement the system of economic responsibility with piece rate wages based on zero defect and overall fulfillment of work quotas as its core. In the past 2 years and more, the company's production outlook has changed greatly. In 1980, its per capita labor productivity was 10,445 yuan. From 1979 to the end of October 1981, it completed 210 apartment and public buildings with a total floor space of 359,307 square meters, averaging 62 square meters per worker in each year. Its working efficiency exceeded the state quota by 120 percent. Of the 210 buildings completed, 150 have been examined and found to be of zero defect, while the remaining 60 have not yet been examined. The company's construction costs were 8.43 percent below plan. Such a savings in cost was rare in China's construction industry.

How did the Handan Municipal No. 2 construction company make these remarkable achievements, attain its high working efficiency and achieve good construction quality with lower construction costs? How did it proceed in implementing and continuing the system of economic responsibility? These questions will be answered in the following three investigation reports. (End of the editor's note)

The Handan Municipal No. 2 construction company began the system of economic responsibility with the setting of an average advanced work quota. In early 1979, the company began piece rate wages based on work quota fulfillment for the construction workers. Under the wage system, the workers are paid according to work. Workers who overfulfill the work quota are rewarded, those who fail to fulfill it are penalized, and those who just fulfill the quota receive only the basic wage.

What is an average advanced work quota?

The company set the work quota according to the principle that the majority of workers can overfulfill it if they make great efforts, they can just fulfill it if they make some efforts, and they will fall behind it if they do not make efforts.

AGGREGATE ECONOMIC DATA

BRIEFS

GUANGDONG SOCIAL COMMODITIES PRODUCTION--In the first 9 months of this year, the total volume of retail sales of daily necessity products was 9.811 billion yuan, an increase of 11.7 percent over the corresponding period last year. Since the beginning of this year, Guangdong Province has rapidly developed industrial and agricultural production. The peasants' income from domestic sideline occupations in the first half of the year increased by 38.1 percent over the corresponding period last year. Thus, the peasants' purchasing power increased. As a result, famous brand products and high quality products were more popular than cheaper ones. In accordance with the new market demands, the Provincial People's Government took measures at the beginning of this year to develop production of consumer goods for everyday use; light industrial production in the first 8 months of the year increased by 15.7 percent over the corresponding period last year. In addition, production of foodstuffs, construction materials and so on also increased. The relevant departments also ensured supply of these products to the rural areas. [Guangzhou Guangdong Provincial Service in Mandarin 1000 GMT 5 Nov 81 HK]

GUANGDONG ECONOMIC DEVELOPMENT--In 1980 in Guangdong Province, the total agricultural output value was 12.4 percent, the total light industrial output value was 21.4 percent, the total heavy industrial output value was 5.6 percent and foreign currency income was 58.8 percent more than in 1978. From January to August this year, the total industrial output value was 10.5 percent and foreign currency income was 14.6 percent more than in the corresponding period of last year. As the province has readjusted and reduced the areas sown to grain and enlarged the areas sown to industrial crops, production of grain and production of industrial crops have promoted each other and developed in an all-round way. Over the past 2 years, the total grain output has increased by 3.4 billion jin. In 1980, output of sugar was over 1 million tons, output of peanuts was over 1 billion jin and the total output of grain, oil and sugar was more than the previous highest levels. CSO: 4006/128

BRIEFS

SHANDONG ECONOMIC CONTRACTS ADMINISTRATION--The Shandong Provincial Administrative Bureau for Industry and Commerce convened a forum on the administration of economic contracts 17-20 November in Jinan. The forum noted that the province has scored some achievements in the administration of economic contracts. Over 90 counties in the province have implemented this work on the basis of trial implementation in pilot counties last year. It has had a positive influence in developing industrial and agricultural production, accelerating commodity circulation, improving market supplies and stimulating the economy. However, some localities and departments still lack an adequate understanding of the importance of the contract system and have failed to step up the administration of economic contracts. The forum urged localities to study and implement the regulations promulgated by the central and provincial CCP committees on the administration of economic contracts, actively institute the economic contract system and promote the administration of economic contracts. FINANCE AND BANKING

ROLE OF CONSTRUCTION BANK IN READJUSTMENT DISCUSSED

Beijing CAIZHENG [FINANCE] in Chinese No 8, 5 Aug 81 pp 1-4

[Article by Wu Boshan [2976 0590 1472]: "The People's Construction Bank Will Earnestly Implement Readjustment Guidelines"]

[Text] The decision by the party Central Committee and the State Council to implement further economic adjustments and achieve further political stabilizing guidelines is a continuation of the vigorous, great policies of the Third Plenary Session of the 11th Party Central Committee. The proper regulation of basic construction holds great significance for the readjustment of the national economy and the realization of political stability. The People's Construction Bank of China is the entity which manages basic construction funds, accurately comprehends and thoroughly implements readjustment guidelines, improves the management of basic construction appropriations and loans, promotes readjustment of basic construction, and improves investment results. This is an extremely arduous and very honorable responsibility.

Sufficient impetus should be given to basic construction: this is the key to the current readjustment of the national economy. It is the great measure which strives for a balance between revenues and expenditures and for a stabilized economy. First of all, in order to serve economic readjustment, the People's Construction Bank should resolutely handle funds allocation and lending in accordance with the national plan. As for construction projects in the national plan, the People's Construction Bank should reasonably supply funds within the nationally ratified plan and budget. Allocations and loans for projects outside of the plan should be halted in accordance with regulations. The bank should, consistent with the demands of the national plan, guarantee those things designated to be guaranteed and resolutely promote those things designated to be promoted. Second, it should tightly control suspended projects. The key to whether or not the scale of basic construction can be held down is in ceasing or delaying construction of those projects for which there is no urgent livelihood or production need or for which construction prerequisites do not exist. The excessive conditions arising out of unchanged basic construction projects would not be beneficial to improving investment efficiency; a reduction of the current year's scale of investment can also strike a blow in the war on consumption. Thus, the suspension of postponed projects, as affirmed in the national plan, should continue to be urged through administrative and economic procedures. Furthermore, the bank must earnestly do the work arising out of the aftermath of such suspension; it cannot allocate funds to unauthorized organizations approving a return to work. Third, the bank should promptly reflect the actual conditions of the overall scope of basic construction. At present, the investment funds for basic construction come from many channels. This brings some difficulties in controlling the overall scale of basic construction. However, the vast majority of all aspects of the funds used in basic construction are controlled by the People's Construction Bank. In addition, the People's Construction Bank has branches throughout the whole country with which to observe and forecast the actual size of basic construction investment. Comrade Chen Yun [7115 0061] has said: "The monetary, financial, and commercial areas are ones which are well-informed and acutely sensitive." "From these areas, the total situation can be seen." In order to bring about readjustment, the People's Construction Bank should give priority to its own responsibilities and promptly reflect the overall scale of construction, giving all levels of party and government, even to the Central Committee and the State Council, an understanding of the actual situation with which to make decisions. In short, in the process of readjustment, the People's Construction Bank is capable of fulfilling its role, beginning with the overall situation of the national economy.

To reduce the scale of basic construction is also to promote centralized, reasonable measures to utilize construction funds and to improve investment efficiency. The arrangements in this year's plan continue the delay and cessation of some construction projects, relatively concentrate investment, and also include some improvements in the requirements for supply of materials, design, and construction strength. However, it can also be seen that investment in some key projects is still insufficient; some of the materials are still incapable of satisfying requirements as to quantity, quality, specifications, and timely supply, in some areas, such phenomena as "gorging on food," taking state investment funds at will, and spending money freely still exist. The losses and squandering are still fairly serious. For this reason, in the implementation of readjustment guidelines, the People's Construction Bank will also further expand practicable investment, will use the limited investment funds in line with the national plan first of all for construction in energy, transportation, light textiles, construction materials, and then for municipal housing, municipal construction, cultural and educational health, etc. The bank will bring about strengthening of shortened or weakened links, and will bring the operations of key projects and investment projects into line with the national plan. As for projects which only require small amounts of investment and which both alleviate shortages and can be brought into production, the People's Construction Bank can, within the scope of the basic construction expense budget, adjust funds surpluses and deficits and provide loan support in accordance with the financial system. The bank will increase investigation of the basic construction budget, promote improved economic accounting by basic construction units and construction enterprises, and lower construction and engineering costs. It will strictly examine disbursements and loans, greatly tap the potential of funds and materials, and plug the holes through which there are losses and waste. The People's Construction Bank has accumulated some good experience in these areas, and in the economic readjustment it should redouble its efforts and attain even greater efficiency.

Basically, to carry out the readjustment guidelines is to adjust the economic structure, including both the adjustment of state economic proportional relationships and the adjustment of product structure. Further readjustment will achieve even greater coordination in the ration of agriculture, light industry, and heavy industry, trades and industry; even greater reason throughout the entire economic structure; and a basic transformation in our basic construction guidelines. If society's overall production does not rely on the many basic construction projects or the laying of a new organizational structure, but rather relies primarily on giving full play to existing businesses, it will gradually move from extensive to intensive, from extensive farming to intensive farming, taking up a new route where investment is not too great, where one-sided requests for speed increases are not too high, and where economic efficiency is highly stressed, the wealth of society increases a lot, and benefits derived by the state, collectives, and the people are fairly abundant. Accurately comprehending the profound meaning of this holds extremely important significance for the work of the People's Construction Bank in serving and promoting readjustment even better.

In accordance with the demands of readjustment, in the future there will be no great increases in the basic construction investment directly arranged by the state budget, and except for some projects in the weak links of energy and transportation still to be initiated, it will not be possible to start many new projects. Furthermore, the investment in all sectors for revision, reform, or developing potential will continually increase. For this reason, in the future, the People's Construction Bank will not only continue to carefully manage basic construction funding and loans, but will at the same time expend great effort to closely follow the renewal and technical reform of the fixed assets of existing business in order to assist such businesses in practically managing the funds used in developing potential, reforming, and revising to best bring about even greater economic results. Since 1978, the State Council has repeatedly and explicitly requested the People's Construction Bank to provide very effective management of the funds for basic construction, developing potential, making revisions and reforms. Efforts should be exerted to undertake this heavy responsibility.

At present, the People's Construction Bank already manages a lot of funds for basic construction, developing potential, and making revisions and reforms. It manages the financial budgetary allocations for all levels as well as the depreciation funds and production development funds from deposits of departments and businesses; and at the same time, it manages loan funds allocated in succession by finance departments at all levels in accordance with the necessity and possibility for measures to make reforms and develop potential. It should manage these funds properly, support the reasonable reorganization of existing businesses, implement coalitions, bring about technical reforms and equipment renovation, and promote the rationalization of the economic structure. In the future, following the expansion of readjustment and reform, the responsibility of the People's Construction Bank for the management of funds for development of potential, reformation, and revision on behalf of existing businesses will certainly increase daily. It should be pointed out that there are still some comrades among us who have insufficient understanding ideologically for this great change. They still remain in that original phase where basic construction allocations are handled in accordance with the plan and they still have not put the management of funds for development of potential, reformation, and revision on the agenda. Some go so far as not to consider such measures as projects for the basic construction plan and think that managing such funds is outside the realm of the People's Construction Bank. Obviously, this is inconsistent with readjustment demands and development conditions. It should be rectified.

The People's Construction Bank will support existing businesses in the increase of production and development of potential in two aspects. On the one hand, it will actively develop deposits and attract idle capital back into production areas as fixed assets; on the other hand, it will earnestly provide proper handling of various loans for potential development, reformation, and revision. The question of loans in particular should be discussed here. As early as 1979, Comrade Deng Ziaoping pointed out that the People's Construction Bank should also act as a lever. Even though it is called the Construction Bank, it should not be content with making computations and calculations, but also should open wide its doors and be skillful at economics and trade. Through various methods such as credit, trusts, and acting as agents, it should gather together funds for return to production areas as fixed assets. The bank should also be used to actively mobilize such funds in accordance with state policy requirements and investment guidance to adjust the funds surpluses and shortages among the various departments and businesses. Further, it should support old factories in developing potential, reformation and revision in accordance with the plans for use of such funds ratified by the various businesses and departments realizing increased receipts for increased production. The use of funds for measurers to develop potential and implement reforms and revisions should comply with the readjusted state economic guidelines and benefit the improvement of the economic and product structures. In 1981, there should be emphasis on supporting existing businesses in the development of consumer goods production required by the market, as well as the enlivening of the market, the withdrawal of currency, and the increase in fiscal revenue to satisfy the needs of the people. In order to solve the problem of insufficient housing, particularly the problem of "small families of small means" using their housing funds yearly, the Construction Bank can absorb housing deposits and issue housing loans. When extending credit for measures to develop potential, make revisions and reforms, particular attention must be paid to the conditions. The principle of "the five loans available and the five loans unavailable" must be persistently applied with extreme attention given to the result of the credits.

At present, our nation is in the midst of a new change in the course of history. The developments in circumstances and the changes in construction guidelines inevitably bring new developments and changes to the work of the People's Construction Bank. Our thinking should be guided even more by improving economic results. Our work objectives should expand from the renewal, expansion, or reconstruction of fairly small units to the development of potential, revision, and reform of the many existing businesses. The content of our work should gradually make the transition from carrying out the many financial functions to continually improving the function of the bank at the same time as improving the financial functions. Our working procedures should gradually be transformed from the simple administrative procedures of supervision of funds allocation to even better application of economic procedures. Under these conditions, the entire staff of the Construction Bank, and in particular leading cadres at all levels, should show a great improvement in thinking and in work as well as a great change in working style.

The key lies in study, research, and investigation. We should continue to earnestly study the relevant Central Committee documents, persist in the four basic principles, earnestly strengthen political ideology, and pay attention to eliminating the influence of "leftist" thought from our guiding ideology. We should broaden our outlook; we should investigate, analyze and do research in economics in line with the demands of "liberating ideology, using our brains, being practical and realistic, and uniting in being forward-looking." In a sense, how well the work of the Construction Bank is done to a very great extent is determined by how well the research and investigative work is done. For this reason, no matter how busy the enterprise, it should resolve to transfer some leading cadres to the development of economic research. The key points in the research are: 1) proper investigation of the feasibility of a project and an analysis of the necessity, possibility, and economic rationale of the project in order to create conditions for inclusion in the planning, arrangement, and confirmation of the 1982 funding supply (funds allocation and lending); 2) investigation of the economic results of the project once on-line to discover typical or general experiences in order to seek ways to improve investment results; 3) development of the industry's economic research and establishment of a system for the exchange of economic information in order to have a firm grasp on reliable economic data for the allocation of funds and the extension of loans.

We should clearly recognize and undertake the heavy burden, brace ourselves, work hard with spirit, be modest and prudent, bring about cooperation, spare no efforts, and do each bit of work to make the rightful contribution to the readjustment of our economy.

CONFERENCE URGES FORMULATION OF ENERGY STANDARDS

Beijing BIAOJUNHUA TONGXUN [STANDARDIZATION JOURNAL] in Chinese No 5, 1981 p 11

[Article by Xu Wen [1776 5113]: "Speeding Up Formulation of Energy Standards"]

[Text] In May 1981, the State Standardization Bureau held a national work conference on energy standards in Beijing. The conference was chaired by Comrade Yue Zhijian [1471 1807 1017], deputy director of the State Economic Commission and director of the State Standardization Bureau. The opening address was given by Comrade Wu Bowen [0702 0130 2429], deputy director of the State Standardization Bureau. Professor Wu Zhonghua [0702 0112 5478] spoke at the opening of the conference and, later in the meeting, made scientific reports on heat, energy and energy balance, and thermal efficiency to all the participants.

During this conference there were 37 presentations of scientific research results, work experience and academic papers on the standardization of energy resources. The conference participants proposed a number of useful opinions and suggestions on the production, development and rational utilization of energy, improving efficiency and reducing consumption of energy-consuming equipment, and promotion of new energy-conserving materials, devices, and technology. The papers presented were of high academic standard and they demonstrated the encouraging progresses on the standardization of energy resources made in China in recent years.

During the meeting, serious and detailed discussions were made on the four basic energy standards: unit, notation and conversion of heat, general rules of thermal device energy balance, general rules of thermal device efficiency computation, and general rules of general energy consumption computation.

The main points of the energy standardization plan during the "Sixth Five-Year Plan" period were discussed in the meeting. It is recognized that energy standards are the technical basis of energy legislation and management, rational development of energy resources, improvement of energy utilization, innovation and modification of energy-consuming and energy-transforming equipment. The general goal of energy standardization in the "Sixth Five-Year Plan" period is to establish a series of standards on the development, production and utilization of energy resources, technical energy equipment, energy base, and conservation materials so that they can be coordinated into a complete system to satisfy the needs of energy production and management. Therefore, the following tasks must be done well:

1. Basic energy standards urgently needed in energy management must be established as quickly as possible. After completing the standardization of the four basic energy standards passed in the conference, work should be speeded up in standardizing energy terms and terminology, enterprise energy balance and energy utilization computation rules. Industrial departments should establish at the earliest possible date the standard computation methods of general energy consumption in various types of enterprises and energy balance and thermal efficiency computation standards and associated equipment, meters, and measurement standards for various industrial furnaces and kilns.

2. Establish energy conservation standards for the production and use of oil products. First, the establishment of an automobile gasoline consumption standard should be required in 1982 and, after conducting tests under varied engineering conditions, it should be modified and perfected. Next, energy conservation standards should be made for petroleum products including the most economic and optimal standard octane values compatible with automobile engine parameters, pertinent targets for gasoline and diesel fuel production, lubricating oil that saves electricity and fuel, and standard periods for discarding and changing oil. The conference also requested the Ministry of Petroleum Industry and the Ministry of Textile Industry to quickly establish a national standard for the notably effective electricity-saving No 4 high speed machine oil.

3. Establish coal quality standards for major mining zones and coal consumption standards for large energy consumers. Set up limiting value standard for the effective utilization of low heat-value fuel in order to resolve the question of economic and rational usage of coal resources.

4. Establish a series of standards from raw material, including electrical copper and aluminum, to wires, cables, and electrical transmission and transformation equipment.

5. Do a good job in standardizing new energy resources and new energy-conserving material, technology, and equipment.

The conference asked responsible departments in Shanghai to establish national standards for far-infrared coatings and elements. Standards should be examined and evaluated in Shanghai and then reported to the State Standardization Bureau for approval and issuance.

It was proposed in the meeting that leadership for the energy standardization task should be strengthened. Full (part) time positions should be initiated, training and education of personnel should be carried out, and major undertakings such as "energy balance service centers" should be done well to insure the smooth completion of the tasks listed above.

GUANGXI INDUSTRY, COMMUNICATIONS MEETING HELD

HK270308 Nanning Guangxi Regional Service in Mandarin 1100 GMT 25 Nov 81

[Summary] A Guangxi regional conference on industry and communications was held in Nanning from 18 to 23 November. The conference summed up experiences in the economic responsibility systems, studied the work of further straightening out the enterprises, tapping potential and conducting innovations and improvements, and made preparations for next year's production. The participants seriously studied the relevant central documents and gave their views on how to make a success of industrial production next year.

(Huang Jia), director of the regional economics committee, delivered a report on the current situation in Guangxi industry and communications and the task and measures for 1982. Regional CCP committee first secretary Qiao Xiaoguang and secretary Qin Yingji listened to the reports delivered at the conference and discussed and issued instructions on the issues raised. Regional government Vice Chairman Huang Yun delivered a summation report.

The conference pointed out: Rapid changes have taken place in the region's industry and communications since implementing the regional CCP committee and government July regulations on instituting economic responsibility systems. It is hoped that total value of output by the end of the year will show an increase of about 3 percent over last year. The conference pointed out: the work of instituting economic responsibility systems is still in the exploratory stage, and it is necessary to strengthen leadership, sum up experiences, and constantly improve and perfect the systems. The conference also stressed the importance of tapping potentials and carrying out innovations and improvements in existing enterprises. This work must be vigorously grasped next year.

The conference held: "The region has done a lot of work in recent years in straightening out the enterprises. The machine-building trade has grasped this earlier and better than the others. Next year, under the premise of implementing economic responsibility systems, we must concentrate on straightening out the enterprises and strive to have this work completed in the majority of enterprises before the end of next year, to reach the six criteria set by the State Council."

The conference also called for expanding the region's sugar refining capacity and for developing some industry in mountain areas, where one or two enterprises should be set up in a number of counties next year.

"The regional CCP committee has decided on a 5 percent growth in planned output value of industry and communications next year. This will be an arduous task, but it can be accomplished so long as people work hard. The key to gaining the initiative in next year's production lies in ideological mobilization, stability of policies, and a good grasp of production preparations. We must now get a good grasp of preparations for next year's production and implement them in each enterprise."

SHANGHAI INDUSTRIAL COOPERATION URGED

OW201059 Beijing XINHUA Domestic Service in Chinese 0209 GMT 20 Nov 81

[Letter from XINHUA correspondent Wu Fumin]

[Excerpts] Shanghai, 20 Nov (XINHUA)--The textile industry is a vast field for heavy industry to explore.

In the course of economic readjustment, can heavy industry find more outlets? According to this correspondent's preliminary findings, Shanghai's textile industry alone has a vast market for heavy industry to open up.

At present, new demands in domestic and foreign markets are forcing Shanghai's textile industry to accelerate the upgrading and developing of new generations of products and to renew and transform equipment. The industry urgently needs the machine-building, instrument and meter, chemical and metallurgical industries to provide large quantities of new technical equipment, materials, dyestuffs and raw and semifinished materials.

At present, the textile machinery industry is faced with four big difficulties: It cannot meet domestic demand and is forced to cut down on exports; old products fall short of demand, and this seriously affects development of new products; new textile mills in the country require the provision of new equipment, so service projects for renovating old mills have to be put off; and factories have no spare capacity to carry out their own technical renovations.

Other machine-building industries in Shanghai are of strong technical capability, are well-equipped and can spare considerable resources to convert to textile machinery production. So far, some large and well-known factories in the machine-building trade have undertaken the production of 14 types of textile machinery difficult to manufacture. But the production potential of the machine-building industry, as a whole, is still very great.

At present, more than 30,000 kinds of dyestuffs have been developed world wide. Our country, however, can produce only 490, and not all in sufficient quantity to meet domestic demand. Since 1977, imports of dyestuffs required by Shanghai's textile industry have been increasing year by year. Comparing 1977 with 1980, imported dyestuffs increased from 459 to 810 tons. Last year alone, Shanghai's textile industry spent US $15 million on imported dyestuffs. It is still up to the chemical industry to try to meet the textile industry's needs for dyestuffs.

The conditions of the Shanghai textile industry show that in the course of readjustment, intead of having nothing to do, heavy industry has much to do in a vast field, if it will only seriously change its service orientation.

HEILONGJIANG'S YANG YICHEN ATTENDS TEXTILE MEETING

SK180215 Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 17 Nov 81

[Excerpts] The provincial textile-product sampling meeting concluded 16 November. The provincial plans on producing and marketing textile products for the first half of 1982 were formulated, and many production contracts were signed.

Leading comrades of the provincial planning and economic commissions and the provincial finance and trade office did much work in this regard. The provincial economic commission invited leaders of the Harbin, Qiqihar, Mudanjiang and Jiamusi municipal economic commissions to the meeting to advise enterprises in implementing production and marketing plans. Leaders of the provincial light industrial bureau conveyed the views of the commercial departments and gave guidance to subordinate textile enterprises on improving product quality, increasing product varieties and overcoming blindness in action to do a better job in producing second light industrial products.

Leading comrades in the Provincial CCP Committee and the provincial government were very concerned about the textile-product sampling meeting. Comrade Yang Yichen viewed the samples displayed at the meeting. Comrade Chen Jianfei delivered a report. Comrade Xie Yunqing gave a summing-up speech.

INDUSTRY

BRIEFS

GUANGXI INDUSTRIAL PRODUCTION--The total industrial output value of Guangxi region in October was 27 percent more than October last year. The total industrial output value of the region from January to October was 3.59 percent more than in the corresponding period last year. The profits submitted by the region in the same period increased by 11 percent. The region fulfilled its quotas for production of 17 products, including steel, rolled steel, pig iron, phosphatic fertilizer, agricultural chemicals, TV sets, synthetic fibers, printed and dyed cloth, bulbs and thermos bottles, for this year ahead of schedule. [HK140820 Nanning Guangxi Regional Service in Mandarin 1100 GMT 9 Nov 81]

GUANGDONG FULFILLS MACHINE-BUILDING QUOTA--By the end of October, the Guangdong provincial machine-building trade had fulfilled the total industrial output value of 767 million yuan and overfulfilled its production quota for this year by 2.3 percent 2 months ahead of schedule. The total industrial output value in this period was 8.4 percent more than in the corresponding period of last year. The value of output of mechanical and electrical products for daily use in the province from January to October this year was 30 percent more than in the whole year of 1980. [HK180841 Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 13 Nov 81]

GUANGZHOU INDUSTRY, COMMUNICATIONS FORUM--The forum on industry and communications convened by the Guangzhou Municipal People's Government concluded on 30 October. The forum conveyed the spirit of the national and Guangdong provincial conferences on industry and communications and the Guangdong provincial conference of cadres at three levels, and studied and formulated plans for various work arrangements for next year's industrial production. Comrade Liang Lingguang, first secretary of the municipal CCP committee and mayor, attended the forum and spoke; and Fan Hua, secretary of the municipal CCP committee, made a summation report of the forum. The forum decided that Guangzhou Municipality's industrial production growth rate for the next year will be 7 percent and that efforts will be made to exceed this rate. Serious efforts will also be made to enhance the economic effect. [HK070616 Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 1 Nov 81]

GINGHAI TEXTILE INDUSTRY--The Qinghai provincial textile industrial company recently held a provincial forum on the textile industry to set forth the production quota for the fourth quarter. It was decided that the fourth quarter textile industrial output value of the province should increased by 4.6 million yuan over the original plan, and that next year's output value should be 10.12 percent higher than in this year. The province's January : September 1981 textile industrial output value was 13.65 percent greater than in the corresponding 1980 period. [SK191230 Xining Qinghai Provincial Service in Mandarin 1100 GMT 18 Oct 81]

SHANGHAI TEXTILE TEAM PRAISED--The Shanghai textile assistance team successfully completed its technical assistance program in 70 days and left for Shanghai in several groups starting 22 November. The original plan was for the team to spend 3 months in Anhui. On the morning of 21 November, the provincial textile industry department and the Hefei Municipal Textile Industry Bureau held a meeting at the Anhui knitwear plant to examine the achievements of the team in providing technical assistance to Anhui Province. Leading comrades of the provincial and municipal CCP committees attended the meeting and celebrated the achievements together with all members of the Shanghai textile assistance team. In his speech, Comrade Zhang Jingfu highly praised the good work style of the Shanghai textile assistance team and its contributions to Anhui Province and once again expressed his appreciation for the team's coming to Anhui to provide technical assistance. He hoped that from now on a teacher-student relationship and a cordial and comradely relationship between Shanghai and Anhui will be established. He hoped that the relationship would last for a long time in order to promote the four modernizations with concerted efforts. [Excerpt] [OW250954 Hefei Anhui Provincial Service inMandarin 1100 GMT 24 Nov 81]

BEIJING INDUSTRIAL PRODUCTION INCREASE--Beijing, 3 Nov (XINHUA)--Industrial output value in Beijing in October increased 8.6 percent over the same month of last year, registering the biggest monthly increase since the beginning of this year, according to the municipal statistical bureau today. The average daily output value in October registered a 7-percent increase over September. Total output value of heavy industry was 0.9 percent more than in the same month last year while light industry rose 20.3 percent over the same month of last year in terms of total output value. Of the 100 major industrial products of the city, 70 recorded increases over October of last year. The annual output plan for television sets, radio sets, knitwear, refrigerators, washing machines and woolen blankets has been fulfilled, showing increases from 8 percent to 4 times over the same 1980 period. Productivity in state enterprises was up by 4.6 percent over the same month last year. [Text] [OW031013 Beijing XINHUA in English 0701 GMT 3 Nov 81 OW]

BEIJING TEXTILE PRODUCTION--On the basis of fulfilling production quotas in the first three quarters of the year, the Beijing textile bureau recently demanded that all relevant units work hard for 90 more days to boost production. From January to September, the production value accomplished by the textile front amounted to 1,679 million yuan and profit amounted to 296 million yuan which, respectively, were increases of 11 and 8 percent. In order to fulfill the goal of overfulfilling this year's production quotas, the party branch of the municipal textile bureau recently held its third work conference and pointed out that all workers and staff of the bureau must go all out to increase the economic results. Currently, it is necessary to pay attention to the quality and the orientation of the products. On the other hand, it is necessary to further perfect the economic responsibility systems and strengthen democratic management. In conclusion, the party branch of the textile bureau demanded that all units strengthen ideological and political work and strengthen party leadership over economic work. [Beijing City Service in Mandarin 2300 GMT 20 Oct 81 HK]

BEIJING COMMODITY SUPPLY--From January to September this year, commodity supply in Beijing municipality has been abundant. According to statistics, the retail sales of social commodities amounted to 4.92 billion yuan, which was an increase of 11.2 percent over the corresponding period last year. The retail sales of consumers goods amounted to 4.62 billion yuan which was an increase of 11.8 percent over last year. The retail sales of wool fabrics and silks and satins in the first 9 months of this year increased respectively by 14.1 and 12.2 percent over last year, and retail sales of sewing machines increased by 66.8 percent. Sales of electric fans increased by more than 700 percent. According to certain departments' estimates, the people's purchasing power is expected to be on the increase in the last 3 months of the year. Thus, all departments concerned must work hard to ensure adequate supplies for the people. [HK051434 Beijing City Service in Mandarin 2300 GMT 20 Oct 81 HK]

SHANGHAI INDUSTRIAL OUTPUT--Shanghai's total industrial output value in September was upwards of 300 million yuan more than in the same period last year, accounting fora 5.8-percent increase. The light industrial output value in September topped that of the same period last year by 11 percent while total output value from January to September topped that of the same period last year by 8 percent. The heavy industrial output value in September topped that of the same period last year by 0.2 percent. [OW201125 Shanghai JIEFANG RIBAO in Chinese 7 Oct 81 p 1 OW]

ANHUI DELEGATION VISITS TEXTILE FAIR--A new textile and knitted goods exhibition and sales fair is being held by the Hefei Municipal Textile Industry Bureau at the Hefei Department store building from today through 23 November, to show new achievements by Hefei textile workers in learning from Shanghai. Textile and knitted goods on display include 8 types of products, 23 new patterns, 145 new designs and colors and 4 new varieties. On the evening of 18 November, leading comrades of the province and Hefei City, Zhang Jingfu, Zhou Zijian, Huang Yu, Zheng Rui and Wei Anmin, and the deputy director of the Shanghai textile industry bureau (Liu Guangbin) and general leader of the Shanghai (?assistance) team (Zhou Guoliang) had a preview of the fair. [Excerpts] [OW191431 Hefei Anhui Provincial Service in Mandarin 1100 GMT 19 Nov 81]

HAINAN INDUSTRIAL PRODUCTION MEETING--The Hainan Administrative Regional Economic Committee recently held a meeting of all county economic committee chairmen. The meeting called on the staff members and workers to work hard for 2 months to fulfill this year's industrial production quotas and to make early and good preparations for next year's production. The meeting held that the industrial output in August and September was 1.43 and 9.86 percent more, respectively, than in the corresponding period last year. However, the industrial output from January to September this year was 3.21 percent less than in the same period last year. In view of this, all staff members and workers must attach great importance to the promotion of industrial production. [Haikou Hainan Island Service in Mandarin 0330 GMT 5 Nov 81 HK]

HEILONGJIANG LIGHT INDUSTRY--The output value of Heilongjiang Province's light industry, including the textile industry, increased by 24.4 percent in the first 9 months of 1981 over the corresponding 1980 period, accounting for 83 percent of the 1981 annual output plan. [SK290921 Harbin Heilongjiang Provincial Service in Mandarin 2200 GMT 25 Oct 81 SK]

GUANGXI METALLURGICAL PRODUCTION--By the end of September, the Guangxi region's metallurgical system had fulfilled its quota of profits which need to be submitted to the state for this year 3 months ahead of schedule. The system had a deficit of 1.35 million yuan in the period last year but had submitted profits of 7.72 million yuan to the state by the end of September this year. There were many iron and steel enterprises in the system which incurred losses. Some nonferrous metal enterprises and old enterprises took a long time in their extraction work and their production capacity dropped. Some newly-instituted enterprises have not done well in production. To increase production, the regional metallurgy bureau has seriously implemented production responsibility systems. Since the beginning of this year, the bureau has sent work groups, at three different times, to go deep into basic-level units to help them do well in readjusting enterprises and implementing production responsibility systems. They have also helped them manufacture marketable products. The bureau has planned to submit profits of 7.484 million yuan for this year. By the end of September this year, the regional subordinate iron and steel enterprises had submitted profits of 420,000 yuan to the state and the regional subordinate nonferrous metal enterprises had submitted profits of 8.11 million yuan to the state as compared with the latter's plan for submitting profits of 9.024 million yuan to the state this year. [HK030733 Nanning Guangxi Regional Service in Mandarin 1100 GMT 25 Oct 81 HK]

GUANGZHOU ECONOMIC WORK--At the recent municipal forum on industrial and communications work, Liang Liangguang, Guangzhou Municipal CCP committee first secretary and mayor, said that the municipality must learn from Foshan and Nanhai. He said that although the speed of this municipality's industrial development this year is faster than the other seven cities in the whole country, we must by no means be unrealistically complacent. He introduced at the forum the various advanced techniques and economic targets of Shanghai in industrial production and the speed of the development in Foshan and Nanhai and pointed out the discrepancies between Guangzhou and these places. He said that Foshan Municipality's industrial production had increased by 24 percent and, in comparison with Foshan, the speed of Guangzhou's development was slow. The development of Nanhai County is also faster. The suburban counties of Guangzhou must learn humbly from Nanhai. He also said that this municipality will soon organize a comprehensive group and send it to Foshan Municipality to learn from it. This municipality will also organize all its subordinate counties to learn from Nanhai. [Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 31 Oct 81 HK]

BEIJING INDUSTRIAL PRODUCTION--The industrial front in Beijing Municipality has strived to increase production of marketable products. The municipality's light industrial output value in September was 4.2 percent more than in August this year and 19 percent more than in September last year. In the 15 industrial bureaus, those enterprises owned by the whole people submitted profits of 239 million yuan to the state in September, which was more than that in August this year or that in September last year. [Beijing City Service in Mandarin 2300 GMT 5 Oct 81 HK]

GUANGDONG MUNICIPALITY FULFILLS QUOTAS--So far, 55 industrial enterprises in Shantou Municipality have fulfilled their production quotas for this year ahead of schedule. The total industrial output value of the municipality from January to October was 15 percent more than in the corresponding period of last year. The amount of profits made by the state industrial enterprises and the amount of profits they submitted to the state in this period were respectively 23 and 24 percent more than in the corresponding period of last year. HEILONGJIANG CHECKS MALPRACTICES IN HOUSE BUILDING

SK140920 Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 13 Nov 81

[Text] According to our sources, the discipline inspection committee of the Heilongjiang Provincial CCP Committee recently issued a circular urging all localities to check malpractices by cadres and party members in distributing and building houses. The circular notes: Since the 3d plenary session of the 11th Party Central Committee, many houses have been built by workers and staff. On the condition that most houses should be built by the state in a unified way, workers and staff have been encouraged to build houses. As a result, the housing conditions of workers and staff have improved.

However, some cadres and party members have engaged in malpractices in distributing and building houses and have occupied the property of the state and collectives and encroached on the interests of the masses. Some have arbitrarily built houses without the permission of the departments responsible for this work. Some have purchased building materials by illegal means and have used the workers and materials of the state and collectives to build their own houses. Some have violated financial and economic discipline to build high-standard houses for leading cadres with illegal funds and materials. Some have made use of their power to occupy better houses and seek personal privileges through back-door dealings. Some living in rural areas have built houses in cities and towns. Some even resell the houses they have built for a profit.

The circular notes: Such malpractices will not only waste the state's financial and material resources but also damage the party's prestige, adversely affect the relationship between the party and the masses and interfere with the development of the four modernizations. Since last year, all localities have done much work and scored some achievements in checking these malpractices in the course of studying and implementing the guiding principles, but the evil trend in this regard has not yet been eliminated.

In order to conscientiously implement the guidelines of the notice issued by the discipline inspection committee under the party central committee and to resolutely check the malpractices of cadres and party members in housing distribution and building, the discipline inspection committee of the provincial CCP committee has formulated some specific regulations. These regulations are:

When cadres and party members build houses, they must have the approval of the department concerned. The funds and materials needed in house building must be obtained in legal ways. They should not make use of their power to illegally purchase building materials and build houses with the manpower and materials of the state and collectives. Cadres and party members whose residences are registered in rural areas should build their houses in rural areas and not in cities and towns. When cadres and party members market their houses in order to live in public houses, they must have the approval of the department concerned and should not sell the houses they built at profit. When distributing houses to leading cadres, distribution must be under the unified plan, just as it is for workers and staff. While building houses, it is not allowed to preselect some houses for leading cadres, to change house design and market such houses at higher prices. It is also forbidden to build high-standard houses for leading cadres with illegal funds and materials.

CONSTRUCTION

BRIEFS

JIANGSU RURAL HOUSING CONSTRUCTION--The Jiangsu Provincial People's Government held a provincial rural housing construction work conference in Nanjing 14-22 October. Vice Governor Liu Lin spoke at the conference. The conference urged people's governments at all levels to earnestly implement policies, make comprehensive plans, exercise correct leadership, rely on the masses and adopt measures suitable to local conditions in promoting rural housing construction for the sake of the province's 50 million peasants. Awards and citations were given for outstanding rural housing designs at the conference. [OW231015 Nanjing Jiangsu Provincial Service in Mandarin 1100 GMT 22 Oct 81 OW]

SHANDONG HOUSING DEVELOPMENT--Shandong Province built 9.83 million square meters of housing between 1978 and 1980. About 5.41 million square meters were built in Jinan, Qindao, Zibo, Zhaozhuang, Yantai, Weihai, Weifang, Jining and Dezhou, the province's nine major cities. Per capita living space has increased from 3.7 square meters in 1977 to 4.2 square meters. During the first three quarters of 1981, the province's nine major cities began construction of 3.69 million square meters of housing. About 1.07 million square meters have been completed. [SK291715 Jinan Shandong Provincial Service in Mandarin 2300 GMT 25 Oct 81 SK]

SHANDONG CAPITAL CONSTRUCTION--The Shandong Provincial Construction Commission recently held a forum to study ways to put more capital construction projects into operation in the last 2 months of 1981. The forum noted that our investment in capital construction has yielded poor results, projects already put into operation accounting for only 13.2 percent of the plan. The forum urged provincial departments and prefectural, municipal and county party committees to work closely to complete more capital construction projects and put them into operation. It also urged construction commissions and other departments in charge of capital construction to strengthen supervision and examination of capital construction and make better arrangements for supplies of funds, materials and manpower. [SK290809 Jinan Shandong Provincial Service in Mandarin 2300 GMT 28 Oct 81 SK]

NEI MONGGOL HOUSING CONSTRUCTION--Hohhot, 31 Oct (XINHUA)--According to today's PEOPLE'S DAILY, 336,000 peasant households in the Inner Mongolia Autonomous Region have built new houses since 1980. Individual space has also increased from 9.5 square meters in 1980 to 10.3 this year, the paper reported. The houses themselves, said the DAILY, are being built increasingly of brick, tile and wood, as opposed to the traditional adobe. The resultant cost has risen from 171 yuan in 1979 to 276 yuan, which is afforded by increased incomes from new government economic policies encouraging individual incentives and responsibility. [Text] [Beijing XINHUA in English 1208 GMT 31 Oct 81 OW]

GUANGDONG CAPITAL CONSTRUCTION INVESTMENTS--The amount of investment in capital construction in Guangdong Province from January to August this year was 11.6 percent more than in the corresponding period of last year. Some 800 capital construction projects have been completed and fully or partially put into operation. Fixed assets of some 400 million yuan have been added. Since the beginning of this year, this province's capital construction front has continued to implement the principle of readjustment and has suspended and put off the construction of 24 projects so that capital and materials can be used on more important projects. With the development of the electricity industry, this year 145,000 kw will be added to this province's installed generation capacity. This year the province will increase its volume of freight handled by 550,000 tons and its daily sugarcane refining capacity by some 5,700 tons. The area of residences for staff and workers under construction in the province from January to August this year was 35 percent more than in the corresponding period last year. The areas of the residences for staff and workers completed was some 2 million square meters or 6.2 percent higher than for the same period last year. The areas of premises for the institutes of higher education completed by the end of August accounted for 75 percent of the quota for this year. The area of premises which have been handed over to the institutes of higher education for use is 142,500 square meters. [HK291004 Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 12 Oct 81 HK]

GUANGDONG HOUSING PROBLEMS--The Guangdong Provincial People's Government recently appropriated a special fund of 2 million yuan to help rural communes and brigades solve the overseas Chinese housing problem which is a consequence of land reform. Under the influence of the ultra leftist line, many overseas Chinese households whose class origin had been altered, were relabelled as landlords and rich peasants in the "four clean-ups" and the great cultural revolution. The houses of individual overseas Chinese which had been returned to them in the past in accordance with the policy were again confiscated and committed to the state's trust. Overseas Chinese and their dependents responded strongly to this. Over the past few years, the Provincial CCP Committee and the Provincial People's Government have attached great importance to the solution of this problem. The Provincial CCP Committee approved the report submitted by the party group of the provincial overseas Chinese affairs office on handling the overseas Chinese housing problem which is a consequence of land reform. The Provincial CCP Committee decided to appropriate special funds this year and next to thoroughly solve this problem. [HK291004 Guangzhou Guangdong Provincial Service in Mandarin 1000 GMT 17 Oct 81 HK]

HUNAN HOUSING DOCUMENT--The Hunan Provincial CCP Committee and the provincial people's government recently issued a document, strictly prohibiting the cadres, staff members and workers from taking advantage of their positions and powers to encroach on the property of the state and the collectives and infringe on the masses' interests for the purpose of building houses for their own use. Those who want to build houses for their own use must personally submit applications, which will be examined by county or municipal construction committees or housing departments. When leading cadres want to build houses for their own use, they must submit their applications to their upper-level organs for approval. As the labor turnover of office cadres, staff members and workers is great, they are, in principle, not encouraged to build houses for themselves. When they build houses, these houses are only for their own temporary use. When leading cadres move out, the use of their houses must be arranged by relevant departments in accordance with the regulations and the houses cannot be privately transferred to their own children or relatives. [HK101055 Changsha Hunan Provincial Service in Mandarin 1100 GMT 22 Nov 81 HK]

HENAN URBAN HOUSING CONSTRUCTION--This year, Henan Province has speeded up building of urban residential houses. From January to September this year, the amount of investment in the construction of urban residential houses in the province was 144 million yuan, the area of residential housing under construction was 5.22 million square meters and the area of residential housing completed was some 1 million square meters. The residential house completion rate was 25.1 percent more than in the corresponding period of last year. [HK030410 Zhengzhou Henan Provincial Service in Mandarin 1130 GMT 15 Oct 81 HK]

SICHUAN HOUSING CONSTRUCTION--Chongqing, 27 Oct (XINHUA)--More than 330,000 square meters of housing has been built so far this year in Chongqing, a big industrial city in southwest China, according to the local city planning bureau. In the past 3 years, the city has built apartments with about 2 million square meters of space, housing 40,000 families. This is part of the 14 million square meters of housing completed in the urban areas of Sichuan Province in the past 3 years, approximately half the amount of housing built between 1950 and 1978. Efforts are being made to turn this hilly city into one clean and modernized, said Zhou Maogui, deputy director of the Chongqing City Planning Bureau. [OW311145 Beijing XINHUA in English 1225 GMT 27 Oct 81 OW]

GUANGDONG RETURNING HOUSES--The Guangdong Provincial People's Government issued a circular calling for all localities in the province to return the houses occupied during the cultural revolution to the overseas Chinese who are the owners of the houses. The provincial people's government stipulated in the circular that the houses of overseas Chinese occupied by the CCP and the people's government organs, the PLA units and leaders at all levels must be returned to the owners by the end of 1982. All units and individuals who occupied houses belonging to overseas Chinese must resolutely implement the regulations stipulated by the central authorities. They should return the houses on schedule according to the regulation. Anyone who violates the policy must be dealt with sternly. The housing authorities will be responsible for registering the occupied houses and rearranging the accommodation of people living in houses belonging to overseas Chinese. The circular also pointed out that houses taken before the central revolution should also be returned to overseas Chinese. The owners of the houses must not press the inhabitants to move out, they must be considerate and patient. [Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 18 Nov 81]

HUBEI RESIDENTIAL CONSTRUCTION LOANS--According to HUBEI RIBAO, with the approval of the provincial people's government, the provincial construction bank has decided to establish business of giving loans for residential construction in one or two counties and towns in the following 10 municipalities: Wuhan, Huangshi, Shiyan, Shashi, Yichang, Xiangfan, Jingmen, Laohekou, Suizhou and Echeng. The price of the residential flats is to be decided in accordance with the state's relevant regulations and the differing situation or residential construction. Prior to constructing the flats, the construction units should sign contracts and pay a certain amount of deposit into the construction banks; the bank will then give credit for construction only when the deposits of the construction units in the bank amount to half the total construction cost. LABOR AND WAGES

'RENMIN RIBAO' URGES OPENING AVENUES OF EMPLOYMENT

OW250127 Beijing XINHUA Domestic Service in Chinese 0748 GMT 23 Nov 81

[Text] Beijing, 23 Nov (XINHUA)--RENMIN RIBAO today carries an editorial entitled "Open Up Many Avenues for Work and Employment" which says: To solve the labor employment problem in our country it is first necessary, under unified state planning, to actively create conditions and open up all employment avenues so people who should work can find work. Second, it is necessary to provide employment in a planned way, that is, to set priorities, gradually enable all laborers to undergo pre-employment preparations, give them job training, including technical and political-ideological education and temporary work, and choose the best ones for jobs. Experience has proved that the past practice of the state taking unconditional responsibility of assigning people awaiting employment in cities to jobs in state-run enterprises is not a good practice. Our country has a large population, and as the people looking for work continues to increase, this practice is difficult to continue anyway. To regard this practice as a superior feature of socialism is a very big misunderstanding.

The editorial points out: To fundamentally solve the employment problem, it is imperative to strive to develop the economy and various constructive undertakings while readjusting the industrial and ownership structures. It is necessary to remove the influence of past leftist mistakes and actively develop commerce, service trades and consumer goods production as well as farming and livestock keeping in suburban areas. These are trades that can absorb a large labor force. At the same time, it is necessary to pay attention to opening employment avenues in the collective and individual economies. Under the premise of maintaining the predominance of the socialist public-owned economy, it is the party's strategic policy decision to allow the coexistence of multiple economic forms and different management practices for a long time to come. It is necessary to encourage the young people awaiting employment to get organized and find work in collective enterprises. We should not insist that the collective economy always take the same organizational form or insist on always following the same pattern. Instead, we should give support but not monopolize, maintain control but not be too rigid. It is necessary to suitably develop the individual economy in cities and towns and open up more avenues for people to find work on their own. The young people awaiting employment in cities and towns should be encouraged to engage in individual economic undertakings. They should enjoy the same social status and receive the same political treatment as workers and staff members in state-owned and collective enterprises. Also, under overall planning, they should be given active support in work space, funds, supply of goods and so forth so as to create conditions for the continuing development of individual economic undertakings in cities and towns and so some of the young people awaiting employment will be willing to engage in individual economic undertakings and take the road of finding work on their own.

The editorial says: It is necessary to bring into full play the role of the labor service companies in organizing collective economic undertakings and in organizing, managing and training the young people awaiting employment It is necessary to coordinate the forces in all fields, earnestly do a good job in pre-employment training work and gradually achieve the goal of providing training for people before offering them jobs.

LIAONING CIRCULAR URGES CONTROL OVER BONUSES

SK150526 Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 14 Nov 81

[Text] On 12 November the Liaoning Provincial CCP Committee and People's Government again issued a circular urging municipalities and prefectures and provincial level departments to strictly control the issuance of bonuses. The circular points out: Since the issuance of circulars by the State Council and the Provincial People's Government on controlling the issuance of bonuses, cases of the arbitrary awarding of bonuses have occurred one after another in many localities, departments and enterprises. We must be determined to stop this unhealthy tendency of reckless bonus distribution.

The circular stresses: Leading bodies at all levels must regard the issuance of bonuses as a matter of importance and immediately carry out research to solve the problems involved in it. They should attend to correcting all practices which violate the regulations promulgated by the state and provincial authorities. The circular urges competent economic departments at all levels to earnestly examine the issuance of bonuses in their affiliated departments and strictly control it. Units and their responsible persons found arbitrarily issuing bonuses should be severely dealt with and sanctioned economically. Workers who have received unwarranted extra bonuses will have them deducted from their monthly bonuses.

The circular points out: It is necessary to pay attention to preventing extra earned bonuses, which can get out of hand if we do not strictly control them now. Therefore, we must step up ideological and political work and urge enterprises to keep their surplus money as welfare or reserve funds or hold it for next year. They should not give out all their money to their staff and workers.

URBAN EMPLOYMENT FIGURES REPORTED

OW220741 Beijing XINHUA in English 0712 GMT 22 Nov 81

[Text] Beijing, 22 Nov (XINHUA)--Over 4.7 million people in China's cities and towns got jobs in the first 9 months of this year, according to the State Bureau of Labor. About 46.5 percent of the newly employed were assigned to collective enterprises.

At the end of September, more than 1 million urban people in the country were registered as self-employed, 220,000 more than in 1980. Of the newly registered self-employed, the number of young people has increased, according to the bureau. In Guangzhou, young people now account for more than 50 percent of the self-employed, as compared with 40 percent last year.

The self-employed young people are mainly engaged in tailoring, catering, repairing and other service trades for urban residents.

With the readjustment of the country's industrial structure, more people now are working in service trades. At the end of June, there were more than 14.1 million working on commercial, catering and other service trades, 1.12 million more than that at the end of June 1980. The bureau said service workers accounted for 13.4 percent of the country's total workers, as compared to 11.4 percent in 1977.

With the development of collective and individual economies, labor departments and labor service companies are arranging technical training courses to prepare young people for future work. At the end of June, more than 2,300 labor service companies across the country had helped over 2 million young people get employed, according to the bureau.

CSO: 4020/37

BRIEFS

BEIJING YOUTH EMPLOYMENT--Beijing, 26 Oct (XINHUA)-- In recent months the number of unemployed young people taking up individual business is rapidly increasing in Beijing City. As of the end of September, the number of such young people had increased to 1,290 compared with 127 at the same time last year. This accounts for 19 percent of the total number of people doing business for themselves. The leading department concerned in the city has been encouraging unemployed young people to become self-employed. The People's Bank extends loans to such young people to help them overcome financial difficulties. [OW311151 Beijing XINHUA Domestic Service in Chinese 0812 GMT 26 Oct 81 OW]

GUANGDONG BONUS ISSUES--To rationally control the awarding of bonuses, the general office of the Guangdong Provincial People's Government put forward specific demands on 6 November: All administrative commissioner's offices and the people's governments of all municipalities and counties must organize departments concerned to set up temporary offices and inspection groups to supervise and help all fronts to inspect and analyze the situation of awarding bonuses and implementing piece rate wages. They must curb the indiscriminate awarding of bonuses and put forward opinions and measures to improve the method of awarding bonuses next year. The Provincial People's Government has sent inspection groups to Foshan, Zhanjiang and Shaoguan municipalities to conduct inspection. The Guangzhou Municipal People's Government has conducted the inspection of the municipality. The Provincial People's Government is prepared to hold a report meeting on the awarding of bonuses in the near future. It has also demanded that all prefectures, municipalities and counties report their inspection to it at the end of November. [HK160721 Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 12 Nov 81 HK]

HUNAN URBAN EMPLOYMENT CONFERENCE--The Hunan Provincial Conference which was held by the Provincial People's Government on urban employment concluded on 13 October. The conference decided that in future, the urban employment problem must be mainly solved by developing the collective economy and the individual undertakings' economy. This conference lasted 8 days. The province has arranged work for some 800,000 young people awaiting employment, some 424,000 of whom work has been arranged for in collectives. The number of people engaging in individual industrial and commercial undertakings has increased from some 2,000 to approximately 30,000. However, this is still far from meeting the needs of society. To develop various kinds of collective and individual commercial and service undertakings, labor-intensive light and textile industries and handicrafts meet the needs of people's livelihood, achieve better economic effect and attain the aim of arranging employment for more people. [Changsha Hunan Provincial Service in Mandarin 1100 GMT 14 Oct 81 HK]

HUBEI EMPLOYMENT CONFERENCE--The Hubei Provincial People's Government's work conference on labor and employment ended on 15 November. The conference conveyed the spirit of the central labor and employment conference and studied the measures of implementing the spirit of the central conference. The conference demanded that all departments concerned grasp employment work and develop the political situation of stability and unity. The meeting held: In 3 years' time since the third plenary session, the province has already arranged jobs for more than 800,000 people in the urban areas. However, the province still has to arranged jobs for some 70,000 people this year. Thus, the province has to make more efforts and provide more opportunities for employment. [HK250859 Wuhan Hubei Provincial Service in Mandarin 1100 GMT 16 Nov 81]

HUBEI EMPLOYMENT--From January to October this year, Hubei Province arranged jobs for 130,000 people, 72.7 percent of whom have taken up jobs in collectives and individual undertakings. This was the first time that the number of jobs in collectives and individual undertakings had exceeded that in state-run units over the past 25 years. The whole province now has 75 labor service companies and 360 labor service centers, which are responsible for recommending laborers for jobs, organizing production and service and conducting vocational training. According to statistics, the whole province now has some 800 farms and teams owned by collectives with educated youths as the main force and agricultural, industrial and commercial joint enterprises, which can produce some 400 types of products, including agricultural, sideline and native products, bamboo and wooden wares, industrial art articles, knitwear, garments and domestic electrical appliances. The total output value has reached some 80 million yuan. The number of staff and workers of all collective enterprises throughout the province has reached 1 million people. Some 23,000 people have been engaged in urban individual undertakings. [Wuhan Hubei Provincial Service in Mandarin 1100 GMT 23 Nov 81]

GUANGDONG LABOR REEDUCATION MEETING--The Guangdong provincial meeting on labor reeducation concluded on 8 November. The meeting held that labor reeducation departments in the province have achieved very good results in educating and reforming people receiving reeducation through labor. From January to September, some 500 people in the province were discharged from the labor reeducation centers before the expiry of their terms and several thousand people receiving labor reeducation were rewarded. ZHEJIANG PROVINCE DEVELOPS WATER TRANSPORT

OW261406 Beijing XINHUA in English 1241 GMT 26 Nov 81

[Text] Hangzhou, 26 Nov (XINHUA)--Coastal Zhejiang Province has steadily increased harbor construction, shipbuilding and shipping services in the past years, according to the provincial transport department.

Water transport volume in Zhejiang, which has a long coast line and hundreds of miles of rivers, accounts for half of all provincial transport, the department said. More than 60 million passengers and 50 million tons of freight are shipped by water annually. The passenger figure is the highest in the country and cargo transport more than 20 times that of 1949, the year the people's republic was founded.

Zhejiang's seaports include Ningbo, Wenzhou, Haimen, Dinghai and Shenjiamen, with a combined annual cargo handling capacity of 10 million tons. The province has renovated or built 41 new docks, bringing the number of docks with a yearly handling capacity of 500,000 tons to 27. Thirty-one berths are above 1,000 tons. Four berths built in the new ports of Beilun and Zhenhai handle between 10,000 and 100,000 tons.

In 1949, Zhejiang built only small wooden junks. The province now has 70 ship repair and building yards. The yards build both river- and sea-going vessels. The province now has a fleet of 14,000 vessels, nine times the early post-liberation figure. Most of the province's former junks are now motor powered or replaced by steamships.

Eight river systems, including the Qiantang and Oujiang, have 10,000 total navigable kilometers. After dredging in the past few years, both transport and pleasure boats have been added.

Zhejiang exports 500,000 tons of farm and sideline products, native produce and finished light industrial products every year. Previously, the goods had to be transshipped at Shanghai. Beginning last year, however, three direct lines from Zhejiang to Hong Kong, Japan and Korea have been opened.

TRANSPORTATION

BRIEFS

FUJIAN COUNTY HIGHWAY--A new highway has been built for the convenience of returned overseas Chinese and their families living in Jinjiang County, Fujian. The 21-li-long, 7.5-meter-wide highway runs from (Xhishi) commune through (Heshan) and (Yonghe) communes to (Anhai) commune in the county. The road was built with the help of the PLA in 24 days. [OW071155 Fuzhou Fujian Provincial Service in Mandarin 1120 GMT 5 Nov 81 OW]

GUANGDONG RAILWAY PROJECTS--Due to economic readjustment, the construction of the big Beijing bridge on the Guangzhou-Maoming railway line and the Dayaoshan tunnel on the Hengyang-Guangzhou section of the Beijing-Guangzhou railway subsidiary line was suspended. It has now been decided to resume the construction of these two projects, which are key capital construction projects in Guangdong Province. The total length of the Guangzhou-Maoming railway line is 352 km. This line has two main projects: The big Beijing bridge and the big Xijiang bridge. The total length of the big Beijing bridge is 1,377 meters and the total length of the big Xijiang bridge is 1,333 meters. The total length of the Hengyang-Guangzhou railway section is 338 km and the total length of the Dayaoshan tunnel is 14.4 km. [Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 19 Oct 81 HK]

HEILONGJIANG COAL TRANSPORT CONFERENCE--The Heilongjiang Provincial People's Government convened a telephone conference on the evening of 27 October urging government, mining enterprises and railway transport departments to accelerate turnover of trains and improve coal transportation. Deputy Governor Lu Guang spoke. The conference noted problems in coal transportation. Because of inadequate unloading and transport capacity, goods piled up in various localities. This affected the turnover of trains and coal transport. The conference urged localities and departments to launch a crash activity week to unload and transport all goods and clear the yards. They were urged to improve the situation in coal transport by 5 November. The conference urged railway departments to improve efficiency and transport coal on a priority basis. PROPORTIONAL BALANCE IN NATIONAL ECONOMY URGED

Kunming YUNNAN RIBAO 14 Aug 81 p 3

[Article by Ma Hanru (7456 3352 0320) and Xu Guoqiang (1776 0948 1730): "Make a Great Effort to Study Economic Theory - An Elementary Discussion of Marx's Theory of Reproduction"]

[Text] The "Resolution on Some Historical Problems of the Party Since the Founding of the Nation," which was passed at the Sixth Plenary Session of the Eleventh Central Committee, forcibly points out: "All the work of the Party must comply with and serve the central element of economic construction and all of the Party cadres and particularly those cadres in the economic sector must make a great effort to study economic theory, economic work and science and technology." Making a great effort to study Marx's economic theory is a task of great urgency. The theory of social reproduction that Marx discussed in the second volume of DAS KAPITAL is not limited merely to a reflection of the characteristics of capitalist production. At the same time that it considers reproduction and circulation of the total capital of a society, it also profoundly reveals the general laws of reproduction in such a society. These laws are the common laws of socialized great production and still have a very great guiding effect on our establishment of a socialist economy today. For this reason, conscientious study of Marx's theory on reproduction is of extremely great and pressing significance for us in correctly summarizing the lessons of past experience in economic construction, in doing a good job of readjusting and reforming the people's economy and in carrying out establishment of the "four modernizations" in a smooth way.

Marx's principles regarding reproduction tell us that the production of materials goods in any society can generally be divided into two major categories, i.e., the production of the means of production and production of consumer goods. Objectively, social production requires that production in both of these major categories be carried out in a fixed proportion. In addition, production within each major category must also be in a suitable proportion. If it is not, social production cannot occur in a smooth way. If we are to realize production, this also requires that there be a proportional balanced development among agriculture, light industry and heavy industry, and, within them, among internal structure, accumulation, consumption, production and capital construction. However, because our economic work has been affected by "leftist" errors over a comparatively long period of time, we have neglected the overall equilibrium of our national economy, and, blindly impatient for success, we sought after high speed, high quotas and high accumulation with the result that the scale of capital construction exceeded the financial resources of the nation and the actual capacity of our material resources. Moreover, we put undue emphasis on expanding heavy industry while squeezing agriculture and light industry. This had a direct influence on continual improvement in the standard of living of the people. The result was that the high quotas and high accumulation did not bring high speed or high effectiveness. Rather, an unbalanced development of production was created. Economic effectiveness went from bad to worse and the proportions of the national economy fell seriously into imbalance so that the establishment of the socialist economy took a tortuous path. A study of Marx's principles of the relationships between the two major categories of social production is of assistance to us in deepening our knowledge of the objective laws of social production so that in economic construction we can devote attention to adjusting the proportional relationships between accumulation and consumption and between production and capital construction and can change the state of affairs of in which "too much emphasis is put on heavy industry, too little emphasis is put on light industry, while in agriculture, light industry, and heavy industry we actually have a situation in which 'the masses slight agriculture.'" In construction policy, we must turn from one-sided development of heavy industry with steel as the key link to stressing the expansion of production of consumer goods and to taking a course in which there is coordination between production of the means of production and production of consumer goods.

Marx's principles concerning reproduction also tell us that the key problem in social production is the problem of realization. This includes the compensation for value and the exchange of materials among the various components of total social production. Socialized production is the unification of production, distribution, exchange and consumption in which production is for consumption and consumption causes the final fulfilment of production. If production is isolated from other links, then social production will be affected. If the goods of the various sectors of the society meet the needs of the market and are in accord with the needs of the society, then exchange of goods becomes possible and it will be possible for social products to be realized. However, for a comparatively long period we have more often than not put the emphasis on production while neglecting circulation and consumption, with the mission of the productive sectors being merely fulfilling the quotas set from above and with very little concern being given to the actual requirements of the consumers (sectors). As the result, there appeared a strange phenomenon in which, on the one hand, a few very popular products that were welcomed by the masses were usually sold out, while, on the other hand, some products were overstocked in large amounts, with a comparatively large portion of goods and materials not being realized because of poor sales so that large amounts of property created by the hard labor of the people were wasted. A study of the principles relating to reproduction assists us in coming to an understanding that we must make a great effort to get a good grasp of the problem of realization of products in socialist production of goods. We must use scientific methods in administration and management, pay attention to such links as circulation and consumption and do a good job of market forecasting with the needs of the people as our final objective. On this basis we must also make arrangements as to what our production units should produce and how much they should produce so that compensation for and exchange of individual components of products can for the most part be obtained. We must set out from the characteristic of a socialist economy that it is an economy in which there are planned products and we must put a planned economy into practice on the basis of public ownership. At the same time, we must bring the effects of market adjustment into play and make a great effort to do a good job of socialist production of goods. In particular, we should make a great effort to expand production of consumer goods. Expansion of production of consumer goods is beneficial in increasing income, withdrawing currency from circulation, increasing exports, economizing on energy sources, allocating the work force and improving the standard of living of the people. For this reason, in readjusting the economic structure, we must put expansion of production of consumer goods in an important position and be conscientious in getting a good grasp on it. Practice will make it clear that putting great effort into expanding the production of consumer goods will lead to changes in the overall structure of the economy, will bring about a gradual restoration of rational internal connections between each sector of the economy and will bring about a much better articulation between production structures and consumption structures. Thereby good circulation of the national economy can be realized. In this way, we can greatly increase the ecomomic effectiveness of each sector of the economy, a suitable solution can be obtained for the contradiction between accumulation and consumption, our national economy can continously advance along a healthy course and the standard of living of the people can get better day by day.

Marx, in discussing the production and circulation of the total capital of a society, divided expanded reproduction into two categories: He called expansion of the scale of production due to expansion of the place of production extensive expanded reproduction and he called production in which the scale of production has been expanded as the result of the increase in the efficiency of the means of production with its attendant increase in labor productivity intensive expanded reproduction. These formulations are of great guiding significance for us in expanding the national economy and in establishing the "four modernizations." In the past, when we brought up the topic of expanding production our first thought was that we "must invest, build new plants and open shops," going enthusiastically into "extensive" management and believing that this could be called expanded reproduction. The result was that our shops got bigger and bigger, the battleline of capital construction grew longer and longer, investment lost its effectiveness and the period of construction grew long. In the period of the "First Five Year Plan," the period for construction of large and medium scale capital construction projects in our province was generally an average of about five years. However, after that, it became prolonged to an average of eight years and to over ten years in some cases. In some projects, additional investments had to be made, with budgets being exceeded to a great extent. Since expanded reproduction in the past was primarily extensive, there were many construction projects that could not develop productive capacity very quickly and there were some projects that were not completed, resulting in great waste to the national economy. Through a study of Marx's writings on the two categories of expanded reproduction in the theory of reproduction and by integrating it with reality in our nation, we can come to an understanding that the important thing in carrying out building of a socialist economy at present and for a comparatively long time in the future is not to rely on building new plants and expanding the scale of capital construction but rather to rely on bringing the effects of existing enterprises into full play with the primary emphasis being placed on intensive expanded reproduction and turning from extensive management to intensive management. Except for such weak links as communications and energy in which a few new projects are needed, we should basically not take on any new production projects. The essential thing is to base ourselves on our close to 400 thousand enterprises with their fixed assets of over 410 billion yuan. On this basis and through "developing, renovating, and restructuring," economizing on energy sources, economizing on raw materials and improving administration and management, we can raise the efficiency of the means of production. By using the method of less expenditure and less investment, we can further expand the scale of production in our nation. This is an essential course for the realization of modernization in China. Practice will demonstrate that if we take this course investment will be decreased and the accumulation rate will not be very high, while economic effectiveness will be comparatively good. As the result, the people will obtain even greater material benefits and fuller play can be given to the superiority of our socialism.

A study of Marx's theory of reproduction of the total capital of a society is of great guiding significance for realization both from a macroeconomic and a microeconomic standpoint. Everything is restricted by these principles from national economic planning decisions and policy on a large scale to the direction of production in a given region and enterprise and its linkage with social production as a whole on the small scale. If, in readjusting our national economy, we do not have a theoretical understanding of the requirement for overall equilibrium in the entire national economy but blindly become preoccupied about gains and losses from the standpoint of local advantage to a region and an enterprise, this will inevitably have an effect on the smooth progress of readjustment of the national economy. In readjusting the national economy, we should at the same time also transform a number of irrational systems and we should also reorganize and improve socialist enterprises. In doing these things, we should also use Marx's theory of reproduction as a guide. If we do not have a theoretical understanding of the bases for determining these decisions, how can we truly carry them out thoroughly with self-awareness in action? Thus, Marx's theory of reproduction is not something that we can or cannot study. Rather, our circumstances and objective reality make it something that cadres at all levels must study. Marx's theory of reproduction has an extremely rich content and extremely profound implications. It is a weapon with which we can summarize our experiences and thoughts and it is a guide to action in carrying out socialist construction. We must make a great effort to study it well and to get a good grasp of it. Even though we may run into difficulties of varying degrees in the course of our study, we must remain aware of the importance and urgency of our study. Moreover, we must strive to study it in a down-to-earth way so that we will be able to understand the relevant basic principles.

ECONOMIC RESPONSIBILITY SYSTEM IN KUNMING'S STATE ENTERPRISES REPORTED

Kunming YUNNAN RIBAO in Chinese 24 Aug p 1

[Article by Shi Zhengfu [4258 2973 6534] and Sun Chaozhen [1327 2600 4176]: "Kunming Has Over One Hundred State-Run Enterprises Practicing the Economic Responsibility System: Gross Value of Industrial Output and Profit Realized from January to July Show Increases Compared with the Same Period Last Year"]

[Text] At present, Kunming City has 125 state-run industrial and communications enterprises practicing the economic responsibility system which integrates the economic interests of the state, enterprises and staff and workers, thereby creating new vitality within the enterprises. From January to July of this year, computing according to fixed specifications, gross value of industrial output and realized profit showed differing degrees of increase over the corresponding 1980 period.

The economic responsibility systems established by these enterprises are multifaceted: 46 of them will implement the system of sharing total profit for a fixed term of 2 years; 17 will pay profit turned over to the state in fixed, progressively increasing amount for 5 years; 44 will hand over "microprofits" [wei li, 1792 0448] to the state for one year; 7 will for one year, enforce the system of responsibility for their own losses as well as for the losses beyond the approved limit, and of retaining surplus as a result of economizing; and 7 will substitute taxes for the profit turned over to the state, carry out the independent accounting system, and assume sole responsibility for their own profits and losses. Since the establishment of this system of responsibility, the problem of uneven profit-making from enterprise to enterprise has been fairly well solved, and each enterprise through hard work has been able to make a reasonable profit. The Kunming City Wooden Furniture Company has put into effect the system of sharing total profit. As a result, from January to July its gross value of industrial output increased 10.06 percent as compared to the same period of the previous year. In the first half of 1981, the profit realized by the state-run enterprises reached 2.08 million yuan, an increase of 51.05 percent as compared to that of the corresponding 1980 period. The profit alloted to the state reached 1.52 million yuan, a 10.6-percent increase over the aggregate profit of the same 1980 period, and the portion retained by the enterprises amounted to 560,000 yuan.

'STAGNATION' CONFIRMS DECADENCE OF IMPERIALISM

Xian SHAANXI RIBAO in Chinese 26 Aug 81 p 3

[Article by Xue Jinjun [5641 6651 6511] and Dong Tianchun [5516 3944 2504]: "Lenin's Thesis of the Decadence of Imperialism Still Is Not Obsolete"]

[Text] As early as World War I, Lenin provided a penetrating analysis of the question of the decadence of imperialism, and emphatically pointed out that the important manifestation of the decadence was the trend of stagnation in production and technology. For the past several decades, especially since the end of World War II, in pace with the development of capitalism, the manifestation of the decadence of imperialism has undergone a new development. As a result, there are some comrades who believe that "empires decline but do not fall," and that Lenin's thesis is "obsolete." Such being the case, how do we treat today's development of capitalist economies? How do we explain the present decadence of imperialism on the basis of economic phenomena? This is a major problem facing theoretical workers.

Materialist dialectics tells us that in looking at a problem we must look at its essence. Seeing through the superficial phenomena of the development of capitalism, it is not difficult to perceive that the decadence of imperialism not only still exists but also continuously deepens. The phenomenon of "stagflation" produced by the economies of the Western nations is the prominent manifestation.

It must be admitted that, after World War II, because of the development of internal contradictions in productive forces and the advancement of the third scientific and technological revolution as symbolized in electronics, atomic energy and space technology, especially the partial adjustment of capitalistic relations of production, these have caused temporary accommodation to the requirements for the development of the productive forces which, in turn, has promoted the relatively speedy expansion of production, and the material livelihood of the laboring masses has also shown some improvement. However, one must also recognize that all of this has not changed the essence of capitalism, the system of private ownership of the means of production, or the exploited and oppressed position of the working people. Accordingly, the basic contradiction of capitalism cannot be resolved once and for all. Therefore the decadent nature of imperialism remains intact.

First, the imperialist economy is a predatory kind of economy. Today's development of imperialism is still largely based on plundering colonies and the countries of the Third World. Through such forms as overseas investments, transnationals, and exchange at unequal values, it extorts a vast amount of resources and the sweat and toil of the working people of Third World countries, and fattens itself. For example, there is an industrially developed capitalist country which for the low price of $140 per metric ton imports raw materials from a developing country. Then after processing, it exports them at the high price of $1,220, and makes a net profit of $1,078 per metric ton. Between 1966 and 1971 American private investments abroad made a profit of 144.5 billion dollars, and the annual rate of profit was generally around 14 percent. Furthermore, the interest obtained by exploiting developing countries was even greater, in 1977 alone reaching 7.7 billion dollars with an interest rate as high as 24 percent. This is the concrete expression of decadence.

Second, the imperialist economy is an extravagant kind of economy. The development of imperialism since the war has been in large part built upon military industrial production and has been pushed forward by militarization of the national economy. In 1978, employment in America's military industry reached 4,781,000, amounting to 24.1 percent of the total workforce in the manufacturing industry, and its value of output stood at 24 percent of gross output value of the manufacturing industry. Moreover, production of weapons is, in Marx's words, "equivalent to taking a portion of the national income and throwing it into the sea." On the other hand, the development of a capitalist economy is also built on the gigantic wastefulness of consumption during the course of consumption and consumption by individuals. A Japanese newspaper ridiculed the waste of energy produced by this "high consumption" policy followed in America in the following manner: "In America, the summers are too cold, and the winters are too hot." This explains that the development of capitalism today is postulated on the tremendous wastefulness of society's labor force, energy resources and material resources. Along with the development of capitalist production, capital proprietary right and right of use have been further separated, and many enterprises are really not managed by capitalists themselves but by their agents. Thus they are completely divorced from the process of production, and they have become a profit consuming stratum depending on living off interest and engaging in speculation as a way of life. In 1980 the number of American millionaires, which in 1948 numbered 13,000, reached 574,000; and in the year 1975 alone, their per capita income from interest and dividends reached over 142.8 billion dollars. At the same time, there appeared such parasitic enterprises as detective agencies, bodyguard agencies, and pornographic publishing. In the United States, the food expenses for cats and dogs alone in one year amount to 2 billion dollars. In contrast, the disparity between the rich and poor has grown wider, and the poverty of the proletariat has continued to grow deeper. In 1975, 12.3 percent of the U.S. population were still living below the poverty line by government pronouncements, and among black people 31.3 percent were living below the poverty line. Even capitalist class scholars could not but admit: "Economic growth really has not brought about the eradication of poverty in the richest nation in the world." (Joan Robinson, U.S.A.)

Finally, the imperialist economy is a form of deficit economy. After the war, due to the capitalist countries' pursuit of Keynesian deficit, inflationary policies, the debt of the Western nations grew more enormous day by day. At the end of 1978, American public and private debt reached a height of 3.9 trillion dollars, with a per capital level of $16,829. That is to say that, in addition to taxes, 22.9 cents of every dollar of individual income went to pay off the debt. At the same time as this debt increased the government's budgetary deficit continuously grew. In 1980 America's budget deficit reached 59 billion dollars, and that of Japan's totaled 71 billion dollars.

The foregoing demonstrates that capitalism today is a decadent, declining morbid economy, a kind of economy with the "chills-and-fever like development" so appropriately described by Lenin. At a certain stage of its development, it is bound to intensify its inherent contradictions, and explode in cyclical economic crises. After the war, Keynesian "anti-crisis measures" and the policy of state intervention in the economy were adopted, which caused the crises to temper. However, they also caused the crises to produce cyclical contractions, frequent eruptions and diverse crises, simultaneously, and other such crisis characteristics. After entering the '70s, the economies of the Western nations also experienced the phenomenon of "stagnation-inflation," which is an additional glaring new manifestation of the decadence of imperialism.

"Stagnation-inflation" (called stagflation for short) is the generalization applied tby Western capitalist scholars to the simultaneous existence of recession and inflation in present-day capitalist economies. Its major characteristic is that as production undergoes reduction and stagnation on an extensive scale, and as the number of unemployed people swiftly and violently rises, prices rapidly move upward. This is a special feature brought about by the crises in capitalist economies since the war, a product of Keynesian deficit-inflationary monetary policy, state intervention in the economy and state monopoly capitalism's fiscal and monetary policies all marching in opposite directions. In the final analysis, this is the inevitable outcome of the development of the basic contradictions at the imperialistic stage of capitalism.

One of the special features of "stagflation" is economic recession, the main manifestation of which is that production and technological development tend to stagnate, even to the point of retrogression. For example, from 1948 to 1955, Japan's, West German's and Italy's yearly increases in industrial production were generally 17.7 percent, 18.5 percent, and 9.7 percent respectively, whereas from 1970 to 1976 these fell to 3.8 percent, 2.1 percent and 3.2 percent. In the '50s, utilization of capacity in the major capitalist countries was approximately 87 percent, in the '60s, 85 percent, and in the '70s, had fallen to 80 percent, making the present economy of the West a sort of "chronically depressed" declining economy. Furthermore, monopoly remains as always an artificially imposed barrier to technological progress. Even capitalist economic scholars have bluntly confessed this. The Belgian scholar [Ernst] Mandel has said: "Monopoly capital has forcefully hindered the third scientific and technological revolution for a decade." America's electric power and oil trusts, in order to preserve their monopoly prices, have vigorously opposed the development of nuclear power plants. Thus it can be seen that, even though capitalism has its development up to a certain extent, its level of development falls far behind the conditions provided by modern science and technology. This fully demonstrates the decadence of imperialism.

Economic recession inevitably leads to a higher unemployment rate. At present, the number of unemployed persons in the developed nations has already drastically increased to approximately 18 million, more than double that before the economic crisis of 1974-75.

Accompanying economic recession and the increasing unemployment rate inflation is also like a runaway horse in full gallop which cannot be checked. In the '50s, consumer prices in all developed countries rose yearly at an average rate of 2 percent; in the '60s, they rose 3.4 percent; and since the '70s, their range of increase has grown higher and higher. In 1980, Great Britain's consumer price increase was 22 percent, South Korea's 26 percent, and Italy's 21 percent. Inflation has brought with it deep and severe suffering for the working people.

"Stagflation" has caused capitalist economies to fall into a dilemma of attending to one thing and losing sight of another. If, in order to postpone a crisis and reduce unemployment, they engage in an expansionary [fiscal] policy, then they are bound to accelerate the momentum of inflation, whereas if they want to rectrain inflation, they must adopt a contractionary [fiscal] policy which tends to be crisis-ridden, and enlarge the ranks of the unemployed even to the point of triggering a crisis. This clearly shows that the preventive measures adopted by the capitalist state apparatus can only temporarily delay the outbreak of a crisis, changing a brief acute pain into protracted labor pains, but that it cannot eradicate the underlying cause of a crisis. The outbreak of six economic crises since the War furnishes convincing proof. Thus it can be seen that the capitalist system simply cannot accommodate the development of the productive forces, and that monopoly capital simply has no way of mastering the increasingly highly socialized mass production. Even though the capitalist class may adopt certain remedies within the scope permitted by the system, even to the point of unfurling the banner of "studying socialism," nevertheless, no matter what the panacea, it will not be able to avoid the inevitable march of capitalism toward extinction. The creation of "stagflation" once again proves that Lenin's thesis on the decadence of imperialism is unquestionably correct. Besides, it tells us as a negative example, that even though socialist economies, which are built upon the base of public ownership, may produce certain complications and faults on the road to advancement, nevertheless, when compared with capitalism, they possess incomparable superiority and great vitality. That socialism must inevitably triumph over capitalism is an unchangeable objective law.

BRIEFS

ANHUI ECONOMIC TRIBUNALS--A provincial conference sponsored by Anhui Provincial Higher People's Court to discuss how to improve trials of economic cases was held from 19 to 24 October. The meeting noted that economic tribunals have been set up in all prefectural and municipal intermediate people's courts in Anhui since May last year. The meeting urged all localities to strengthen the organizational structure of these economic tribunals and to work in close coordination with industrial and commercial departments and other departments concerned in settling disputes concerning contracts and other economic matters. Hu Kaiming, vice chairman of the standing committee of the Anhui Provincial People's Congress, addressed the meeting. [Hefei Anhui Provincial Service in Mandarin 1100 GMT 25 Oct 81 OW]

HAINAN TOURISM DEVELOPMENT--The Hainan administrative region has gradually developed tourism. Haikou, Qiongshan, Wenchang, Qionghai, Xinglong, Wanning and Tongza have set up travel services one after another to be responsible for tourism and reception. Some places in the region have arranged hotels to be responsible for tourism and reception. Since 1978, the region has received some 15,000 tourists. The number of tourists received is increasing by an average of some 30 percent a year. By the end of October, the region had received 22 groups of 215 tourists from Japan, the United States, Iran and various countries in southeast Asia who travelled at their own expense. Meanwhile, the region had also received 51 groups of foreign businessmen who came to the region to negotiate about trade and economic cooperation work. From January to October this year, the region received 5,216 overseas Chinese, Chinese of foreign nationality, Hong Kong and Macao compatriots and Taiwan compatriots who came to the region for the purposes of visiting relatives and friends and on tours, 794 more than the total number of people received throughout last year. The foreign currency income of the region from January to October was some 55 percent more than in the corresponding period of last year. [Haikou Hainan Island Service in Mandarin 0330 GMT 11 Nov 81 HK]

XIZANG ECONOMIC WORK FORUM--From 5 to 13 October, Xizang region held a forum on economic work. The comrades attending held that after the complete readjustment of economic construction in this region, the situation is very good. Agricultural and livestock production is particularly good. It is estimated that the per capita income of peasants and herdsmen will be 200 yuan this year, 20 yuan more than last year. The living standard of peasants and herdsmen has now been remarkably improved. Lhasa municipality has built residential houses for residents and workers of some 56,000 square meters. [Lhasa Xizang Regional Service in Mandarin 1130 GMT 15 Oct 81 HK]

GUANGDONG ANTI-SMUGGLING GROUPS--The Guangdong People's Government has organized cadres from party and administrative organs such as discipline inspection, organizational, propaganda, customs, politics and law, financial and commercial departments to form work groups to fight against smuggling activities. These work groups went to work in Shantou and Huiyang prefectures. They worked side by side with prefectural and county work groups in Chaoyang, Haifeng, Huiyang and Huidong counties where smuggling activities were numerous. [HK160801 Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 14 Oct 81 HK]

SHANDONG FIRECRACKER CONTROL CIRCULAR--The Shandong Provincial People's Government issued an emergency circular on firecracker safety in which the government put forward the following five points for attention: 1) No unit is allowed to sell explosive chemicals directly to rural communes and their members for firecracker production; 2) Earnest efforts should be made to assign temporary firecracker production to certain factories to carefully examine their arrangements for safe production. No individual household is allowed to engage in this production; 3) All transportation fronts should strengthen inspection over their passengers. No passenger is allowed to carry firecrackers and explosive articles; 4) It is necessary to enhance management in markets which sell firecrackers; and 5) In case of accident, it is necessary to find out which leading personnel is to blame for the accident. [Jinan Shandong Provincial Service in Mandarin 2300 GMT 22 Nov 81 SK]

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

WESTERN-STYLE ECONOMIC DEVELOPMENT STRATEGY NOT SUITED TO CHINA

Beijing LIAOWANG in Chinese No 5, 20 Aug 81 pp 23-24

[Article by Lin Zixin [2561 5261 2450], Director, Chinese Scientific and Technical Information Institute, "Studying a Chinese-Style Development Strategy"]

[Text] For a long period of time, the economically developed nations of the world have taken maximizing the increase in GNP as the objective of economic development. This traditional development strategy demands centralized production. This kind of production has two characteristics: one is the concentration of funds, energy resources, resources and technology, and the other is economizing on labor power. Because of this, this development strategy is one of wasteful extraction and utilization of energy and resources. The population of the United State is less than 6% of the world's total, yet that nation consumes 40% of the world's resources each year. If the energy-intensive methods of agricultural production adopted in the United States were spread throughout the world, the globe's entire reserves of fossil fuels such as petroleum, coal and natural gas would be used up within a dozen or so years. It is quite apparent that the world's resources make it very difficult to maintain this kind of a development strategy for a long time.

In reality, in the 30 yeras in which the developing countries have carried out this traditional development strategy, only a handful of countries and regions have performed miracles. The majority not only failed to reach their objectives, but the disparity between them and the developed countries has continued to enlarge with time. The era of low-priced energy resources which the developed countries relied on to develop has gone forever. With their capital fund paucity and labor power abundance, it will be most difficult for the developing countries to attain the capital-intensive labor-saving production of the developed coutnries. For this reason, an increasing number of people feel that the presently developing countries cannot go along the old path of the western developed countries.

Besides this, the developed countries and those developing countries which have adopted this traditional strategy have numerous other social maladies:

for example, the increase in criminal activities and indifference in relations between people that have been brought about by marked disparities between rich and poor and unequal distribution. Some people abroad feel that one cannot view development as economic alone, much less equate it with the growth in GNP, and that development should be viewed as human development in order to make the satisfaction of basic needs the primary objective of development. This includes material needs such as food, housing, clothing and medical care as well as intangibles such as culture, education, a feeling of security and individual dignity.

Ours is a socialist country. When we consider a national development strategy we should persist in taking as our main objectives the elimination of exploitation, the elimination of the three major differences, and the greatest possible satisfaction of the continuously increasing material cultural livelihood needs of the people. We must provide more consumption goods for the people. We must look at more than China's large population and weak economic base and see a bit farther seriously to estimate China's natural conditions and the bearing capacity of our resources. On this basis, we should study China's consumption structure: What kind of consumption goods should be supplied? How should the consumption of the masses be directed? For example, at present everyone knows that China cannot develop as many small cars as the United States or Japan.

Another problem in development strategy is how to develop thoroughly China's advantage of numerous human resources. Labor power and the wisdom and knowledge of people is a most important resource which can circulate continuously, but this resource can only be brought into full play through labor. Here we must first of all pay thorough attention to the problem of employment. Both our long-term and short-term plans should taken into consideration the problem of how to create more employment opportunities. This means that we must do research on the structure of employment. For example, the accleration of the development of service industries is very much deserving of study.

Furthermore, science and technology is a necessary and important element in the development of the economy and society. However, science and technology can only be brought into full play when it is coordinated with the development of the economy and society. Production technology is a direct force of production. We must place particular stress on the research and development of production technologies which are energy and resource saving, which provide more employment opportunities and which can increase the goods for daily necessities as well as improve the income of the people. Internationally this kind of technology is called "applied technology." Many people feel that the development of this new kind of technology is an important avenue to solving many serious problems now faced by the world such as the rapid growth of the population, the energy crisis, resource exhaustion and environmental degradation.

Research on rural development strategy is particularly important for our country with its 1.0 billion population and 800 million peasants. We must definitely strive to build new rural villages in order to raise the level of material and cultural life of the peasants. We cannot do like some developing countries with abnormal urban development producing disastrous results. Of course, we must absorb the plentiful labor power of China's villages, continue to increase grain production on our limited cultivated land and allow the living standards of the vast numbers of rural people to increase progressively. This is a most arduous task.

NATIONAL POLICY AND ISSUES

TONG DALIN OUTLINES NEW RESEARCH TASKS

Beijing LIAOWANG in Chinese No 5, 20 Aug 81 pp 22-23

[Article by Tong Dalin [4547 1129 2651], Vice-Chairman of the State Scientific Commission; "New Topics for Strategic Research"]

[Text] A strategic discussion on economic and social development is unfolding in China's academic, economic and scientific circles. This is another discussion bearing enormous significance following on the others of the past 3 or 4 years on the theory and practice of the socialist economy, covering questions of distribution according to labor, the theory of production forces, the objectives of production and the commodity economy. Now several new topics have cropped up in the course of developing strategic research, and it seems we shall have to intensify our focus on their investigation.

First, how can we make the strategic objectives concrete?

International economics circles have expressed numerous opinions on how developing countries should treat their traditional development strategies and how they should adopt new strategies to replace them. In my opinion, the development strategy of our socialist nation should be based on the continuous growth in GNP so as to satisfy gradually the material and cultural needs of the people. The traditional development strategy of the developed countries of the west concentrated exclusively on the rate of growth of GNP, but because of differences in economic structure, the degree to which problems of social livelihood have been solved and the distribution of social wealth, there are marked differences in the degree to which the basic needs of the people are satisfied. The basic objective of our building socialism is to satisfy the basic needs of the entire people and progressively raise their levels of material well-being and culture. To attain this objective it is first of all necessary to develop the social forces of production and cause the GNP to grow continuously at a certain rate.

The Central Committee has proposed that we strive to achieve a GNP per capita of $1,000 by the year 2000. If we calculate on the basis of a population in that year of 1.2 billion, the GNP would be $1.2 trillion. But how big should the shares of agriculture, industry and other producing sectors be in this? For example, in 1980 agriculture occupied 25 percent of total industri- and agricultural output value. This share should increase by 1990 and 2000. This provides a concrete strategic objective for determining the development of China's agricultural development.

In the area of satisfying the basic needs of all the people we should also proceed from the realities of China's social conditions and the consumption patterns of our people in carrying out detailed scientific surveys of clothing, food, housing, activities, expenditures, education, health and the like so as to establish specific projects and objectives. Only on this basis can we draw up long-term plans for economic and social development and carry out necessary readjustments in the social and economic structures.

Second, can we carry out a rational readjustment of China's economic and social structures according to the concept of three sectors of production?

The appearance of the concept of the three sectors of production is a reflection of the continuous progress in human economic and social livelihood. After the primary sector--agriculture and mining, and the secondary sector--processing and manufacturing industry, have been formed, the increasingly refined division of labor in production leads to the socialization of many things which originally were done within a productive enteprise. Increasingly people's consumption and household labor also become socialized, commodity circulation becomes daily more developed and many kinds of mental labor gradually turns into productive labor which creates value. Because of these factors, numerous new productive enterprises have appeared which, taken together, we call tertiary industry. In the past we only looked upon agriculture and light and heavy industry as sectors of material production and treated the majority of tertiary industries as social consumption sectors. This led to a serious abnormality in economic planning arrangements and in actual daily life. It seems that in the future we must make totally rational arrangements according to the interrelationships and balanced development of tertiary industry. Of course, we still have to study seriously the specific characteristics of China's tertiary industries, their scope, scale and degree of socialism.

Third, what strategic position should science, technology and education have and how can their development be accelerated?

In the future, the development of China's national economy will rely in the main on the technical improvement of the existing enterprises of each productive sector. No economic sector or enterprise can speak of development and progress without adopting appropriate advanced technology and relying on scientific technology. Economic and social development must be linked to the development of science and technology for there to be a development strategy for the entire economy. In the past because China's economic system lacked market regulation and necessary competition, many enterprises were not eager to adopt new technology. Therefore, the reform of the economic system and the readjustment of economic policy are necessary to speed up the development of science and technology.

Education is the key link in intellectual development. China has great human resources. If we develop them intellectually, we can gradually turn China's "liability" of a numerous population into an advantage in rich human resources, and make mental labor play a greater role in the entire productive labor process. Besides strengthening professional technical training, the future development of school education must study how to raise the quality of primary education, increase the proportion of education in middle-level specialized technology, open up the paths to study and accelerate the development of higher education.

Fourth, on the basis of social ownership, how it is appropriate to develop diverse modes of management?

In the past one or two years, based on socialist ownership, there have been numerous creations in management modes. In the villages, various forms of responsibility systems linking remuneration with output, particularly the development of contracting production to the household and contracting work to the household, have greatly aroused the enthusiasm of the peasants and wrought an enormous transformation in agricultural production. This has presented a new topic to theorists: How can large socialized production be carried out in the villages in the future? How, under the conditions of guaranteeing individual operation, do we carry out new unions with various forms? In the cities, will new joint enterprises appear in the wake of the development of small-scale individually operated service trades? There is increasingly immediate significance to research on the trends and future path of development of various different forms of management on the base of a socialist ownership system and on their role in the entire economy and society.

NATIONAL POLICY AND ISSUES

U.S. ECONOMIC DEVELOPMENT FORUM DEEPENS CHINESE ECONOMIST'S UNDERSTANDING

Beijing LIAOWANG in Chinese No 5, 20 Aug 81 p 23

[Article by Dong Fureng [5516 6634 4356], Deputy Director, Economic Institute, Chinese Academy of Social Sciences: "On Economic Development Strategy"]

[Text] Last November, several comrades and I attended a "China-U.S. Forum on the Choice of Economic Development Strategies" in the United States, where we discussed the problems of economic development strategies in China and some other developing countries.

The coice of an economic development strategy is a problem which each developing country must encounter and resolve in the course of devising strategies for its economic development. Broadly speaking, there are two distinct but interrelated questions: (1) the choice of the objectives of an economic development strategy; and (2) the choice of a development path for realizing the objectives chosen. Every developing country faces common problems in its economy, such as poverty, low levels of education, capital shortage, shortage in scientific and technical capabilities, poor business management, enormous disparities between city and countryside, rapid population growth, poor hygeine and employment difficulties. These commonalities ensure that when each developing nation selects its economic development strategy, there are some places where they can refer to each other. However, each developing country must each also consider some particularistic problems in developing its economy, such as the historical traditions of different social systems, different physical environments and resource conditions, different geographical areas, different size populations and different levels of economic development. These particularities ensure that each developing country must select an economic development strategy which is in keeping with its own national conditions. In other words, while the development objectives may be the same, the paths to realizing these objectives should be different.

In the process of attending the forum, I thought many times how in the past we stressed the significance of the social system in the choice of an economic development strategy. Of course this was correct, but we often neglected the fact that there is much in the choice of economic development strategies by developing countries with different social systems which we could draw upon (for example, we have much to learn from the poor results that have been obtained by some developing countries when they make the pursuit of GNP their exclusive objective in their economic development strategy). At the same time, I also thought a number of times on how in the past we often felt, whether consciously or not, that developing countries with the same kind of social system could only carry out the same kind of economic development strategy and neglected the importance of different national characters in choosing a development strategy. From today's viewpoint, countries with the same kind of social system but different national characters may have different development strategies. Indeed, even the same country can adopt different development strategies for different stages of development because of changes in the basic national character. For example, having built up an initial heavy industrial base, the prompt readjustment of China's economic development strategy, for example by elevating the satisfaction of the basic needs of the people to the position of an objective of development strategy or readjusting the proportionate growth between heavy industry on the one hand and light industry and agriculture on the other, can make our country's economic development considerably smoother.

The problem of economic development strategy is extremely complex. There are usually a quite considerable number of objectives which a developing country must realize and contradictions frequently arise between the various objectives in the process of implementation (one example is the contradiction between raising the technical level with increasing employment). This can present difficulties in the selection of objectives within the economic development strategy. At the same time there are difficulties once these objectives have been chosen in selecting the development path to realize them. Because there are usually numerous development paths available to be chosen, there can be enormous disparities in the direct and indirect, short-term and long-term social economic results. In particular, it is not easy to see clearly come indirect, long-term results (one prominent example is the environmental degradation caused by the development of heavy industry). I think that we should recognize that there are no once-and-for-all perfect economic development strategies and that we can only proceed from the basic national characteristics of a country and choose a strategy which, relatively speaking, produces greater results and fewer losses. Moreover, there can be no once-and-for-all choices. In particular it is extremely important to make a prompt readjustment of one's development strategy or change it altogether when the economy is making a transition from one stage of development to another.

At present, China's economic development is in the process of making a great change. By conscientiously studying China's basic national character and seriously summing up the lessons of experience in carrying out past economic development policies, we must earnestly draw up an economic development strategy for the future in order to open up a new situation for the development of China's economy.

NEI MONGGOL RECEIVES PREFERENTIAL TREATMENT FROM STATE

SK300954 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 29 Nov 81

[Text] According to our sources, the party and state have paid great attention to our region's construction and development. Since the 3d plenary session of the 11th Party Central Committee, the party and state have not only helped the region set right things which had been thrown into disorder, implement the party policy towards nationalities and improve relationships among various nationalities but also vigorously supported the region economically. According to statistics, the state allocated 5 billion jin of grain to the region in 1979, 1980 and 1981 and granted more than 1 billion yuan in subsidies to the region in each of these 3 years. To support the region's construction, the state decided to give the region preferential treatment in circulating funds, in retaining a portion of the profits and in giving transport allowances. The state has also made allowances for the people of various nationalities in the supply of cotton yarn, sewing machines, bicycles and wristwatches.

Our region is a fur-producing place from time immemorial. To meet the needs of our region's people on wearing fur clothes, the state has supplied 35,000 pieces of imported high-grade cattle fur to our region. This year the state allocated 12,000 cubic meters of timber to the region from Changbai Mountain and Xiao Xinganling to make furniture needed by Mongolian people. The state has also paid attention to our region's educational undertakings. In the past 3 years, the state invested some 120 million yuan in developing educational capital construction, including the investments covered by the plan, the flexible funds for minority nationalities and the funds for supporting places that are backward economically--a record in the region over the past 30 years.

FINANCE AND BANKING

USE OF CIRCULATING FUNDS BY INDUSTRIAL ENTERPRISES DISCUSSED

Beijing ZHONGGUO JINGRONG [CHINA'S BANKING] in Chinese No 10, 4 Oct 81 pp 38-39

[Article by Feng Zhongying [7458 0112 5391] and Tan Shucheng [6223 6615 2052] of Tiexi District Office of People's Bank of China in Shenyang Municipality: "There Should Be Treatment for Symptoms As Well As Causes"]

[Text] One of the urgent problems during the current national economic readjustment concerns the reduction of circulating funds to be used by industrial enterprises, the acceleration of the turnaround of funds, and obtaining better results in the use of these funds. We have conducted an analytical study on the use of circulating funds by 110 large and medium-size plants in the Tiexi District of Shenyang Municipality during the past 10 years, and the result of the study and our views are here presented for discussion.

Conditions and Changes in the Use of Circulating Funds by Enterprises

The 10 years of circulating fund utilization by these 110 enterprises can be generally divided into the following stages:

The first stage lasted from 1971 to 1973. In these 3 years, people yearned for a normal social order after the serious disruption of the national economy by the "Great Cultural Revolution." It was also the period deprecated by the "gang of four" as a time of "backlash." During this period, the total industrial output value of these 110 enterprises increased by 28 percent; their profits increased by 56.1 percent; the amount of circulating funds required for every 100 yuan's output value decreased by 12.2 percent; and despite a fairly large increase of production, the amount of circulating funds used increased by only 13.1 percent. This was an excellent situation featured by increased production, increased income and decreased expenditure. The change in the use of circulating funds was caused by the upsurge of inventory taking and potential-tapping by the enterprises in response to Chairman Mao's call to clean up the warehouses in 1971. Then in 1972, the State Planning Commission and the Ministry of Finance issued notices on strengthening the control of circulating funds, followed by a nationwide audit of assets and funds. The banks also tightened their credit control and many credit personnel visited the factories and workshops to assist in checking the assets and funds, in taking inventory and tapping potential, and in the disposal of overstocked goods. The enterprises themselves also improved their management of funds, and many financial control institutions, which had been smashed [during the Cultural Revolution] were reactivated. From 1974 to 1976, however, interference and sabotage by the "gang of four" brought the national economy to the brink of collapse, and some newly reactivated institutions were again destroyed.

In the first 2 years following the smashing of the "gang of four," that is, up to the end of 1978, the serious consequences of the disrupted national eocnomy were not yet fully realized, and the appearance of impractically high targets and excessive demands added to the difficulties of the national economy. During this period, the total industrial output value of these 110 enterprises increased by 10.2 percent; their profits declined by 19 percent; the amount of funds required for every 100 yuan's output value increased by 8.6 percent; and the amount of circulating funds possessed and used increased by 19.8 percent. This was a serious situation as shown by the little increase of output, the large increase of funds used, and the large reduction of profits. Since our country had for a long time relied solely on the regulative role of planning, all raw materials were supplied according to state allocations and all products were distributed by the state under a unified plan. Acquisition of raw materials then became the main concern of enterprise management, and the contradiction between production and supply was mainly responsible for the increase in the use of circulating funds.

Another stage lasted from 1979 to 1980. These were the years of implementation of the policy of national economic readjustment as well as the period of a major change in the use of circulating funds by industrial enterprises. During these years, the total industrial output value of these 110 plants increased by 10.6 percent; the amount of their circulating funds increased by 6.6 percent; and the amount of funds required for every 100 yuan's output value was reduced by 3.5 percent. The large increase of output and small increase of funds were mainly attributed to the efforts of these enterprises in strengthening economic accounting and improving business management during the economic readjustment; and to the bank's implementation of the principle of supporting only the deserving enterprises in loan grants, thereby encouraging them to produce according to market demands and to purchase according to their volume of sales. Thus overstocking was reduced and less circulating funds were tied up. At this stage, the regulative roles of planning and the market were brought into play and it was possible for the means of production to find their way into the market. The enterprises' products, previously under the system of unified distribution by the state were now mainly governed by the regulative role of the market. Instead of the acquisition of raw materials, sales of their products have now become the main concern of enterprise management. The contradiction between production and marketing has become more striking.

From what has been mentioned, we can see that although there were many causes for the increase of circulating funds used by the enterprises, such an increase was mainly decided by the current line, principles and policies of the party and the government; by the system of national economic management--under which the forms of material allocation and product distribution all had an impact on the amount of circulating funds--and by the performances of various economic departments (such as the tight or loose control of bank credit) and the level of enterprise management. Therefore, the problem of excessive possession and use of circulating funds cannot be solved by one department alone. Instead, it calls for the joint efforts of all departments concerned.

Treatment of the Causes on the Basis of the Treatment of the Symptoms

To change the present irrational possession and use of circulating funds, we are of the opinion that we should treat the symptoms first and then the causes.

1. We must guard the strongholds and expose the contradictions. There are mainly "three strongholds" to be guarded: first, the stronghold of loan extention according to the volume of sales. The banks should not grant any loan to finance the production of goods that have a poor market, because the loans granted must be commensurate with the volume of sales. This procedure will prompt the enterprises to organize their production [of goods] and purchases [of raw materials] in accordance with their sales. Second, there is the stronghold of separate control of funds. All expenses under financial allocation are not covered by bank loans, and all loans previously used to cover such expenses must be redeemed. The bank will no longer advance any funds for capital construction projects, and enterprises whose funds have been tied down in capital construction equipment are not eligible for bank loans. Third, we have the stronghold of planning. Loans must be based on plans, especially the plans for bank credit which basically fit in with the plans for the production and circulation of commodities. Unplanned loans, or loans in excess of the planned figures will affect the normal development of the national economy.

2. We need to clear the channels for circulation of commodities and funds. The normal turnaround of funds in an enterprise can affect, and be affected by, the normal turnaround of funds in other enterprises. At present, a common effort should be made by all concerned to clear the channels of commodity circulation. The goods sold to those enterprises which have already been closed or suspended should be disposed of according to the specific circumstances. If the goods have already been delivered and cannot be paid for by the buyer who no longer has any source of funds, the state should allocate a special fund or direct the bank to grant a special loan to meet this obligation in order that this bad debt will not cause a chain reaction. As for the equipment still used in production, the departments in charge should give clear instructions as to which type of production should be continued and which type should be discontinued. For some special equipment already produced, the departments concerned should clearly stipulate the methods of procurement. The department in charge should procure this equipment under a unified plan, keep it for proper use, and pay for it out of financial allocation or through special loans. Arrangements should also be made to cover the loss incurred in the production of accessory equipment as a result of the suspension of the main engine's operation. Such losses should be compensated for mainly out of state appropriations.

3. We must imporve the system of circulating fund control. This is the fundamental method to solve the problem of possession and use of circulating funds, and a treatment of the cause. At present, enterprises are not economically responsible for the amount of circulating funds they use. Nor have the departments in charge any responsibility for the use of circulating funds by the enterprises under them. Such a situation must be changed. Instead of a mere formality, the index of circulating funds must serve as a criterion for evaluating the economic result of a department. The department in charge should be responsible for the use of circulating funds by the enterprises under them. Since the producing enterprises are directly responsible for the use of funds, the effects of such use should be related to the economic

benefits of their workers and staff members. The enterprises practicing economy in the use of circulating funds should be given more funds; and excessive expenditures should be taken out of the retained profits instead of the profits to be handed over to the state. The banks can only exercise their supervision according to established policies over the use of circulating funds by the enterprises, but cannot take over the direct responsibility of the enterprises or the departments in charge of these enterprises. We must rely on the departments in charge to lead the enterprises in mobilizing the masses, and on the spenders of money, themselves, to control their money before we can be sure that the circulating funds are well controlled and properly used.

FINANCE AND BANKING

UNHEALTHY TENDENCIES IN BANKING EXPOSED

Beijing ZHONGGUO JINRONG [CHINA'S BANKING] in Chinese No 10, 4 Oct 81 p 43

[Article by Hua Nan [5478 0589]: "The Unhealthy Tendencies of Banks Must Be Rectified"]

[Text] Along with the rectification of party style, our "bank style" also has continued to improve. However, we should be aware that in some banks or banking institutions, there sometimes is the unhealthy tendency of accepting bribes and extoring commodities or supplies by people taking unfair advantage of their official positions. Some of them even have done this openly. Applications for loans and requests for the settlement of accounts were simply laid aside, but after being treated to a feast, they would attend to these jobs with alacrity. So a feast could make all the difference. During their performance of duty, some people had the audacity to demand certain commodities in tight supply and hinted that if people want some attention from others, they should offer some favors first. Some people extorted commodities overtly or covertly, asked for the "most favored treatment," and made private gains at the state's expense. Even the shortage of subsidiary coins on the market offered certain comrades a "golden opportunity" to make "personal connections." All these may be isolated cases, but their effects are extremely bad. Besides hindering the implementation of the party's monetary policy, they smeared the fair name of the banks. This certainly gives us much food for thought and calls for serious attention.

However, some comrades have never admitted their errors. Feeling perfectly at ease and justified, they have even said: "I bought my things without using the name of the bank or threatening to apply any pressure. How can there by any unhealthy tendency to speak of?" This sounds plausible; but the fact was that if this person had not happened to work in a bank and was not in charge of the work related to the interests of the party he dealt with, would he have been honored as a distinguished guest and given all the preferential treatments?

The party Central Committee has always attached great importance to the rectification of party style, and the 6th Plenary Session of the 11th Party Central Committee further reiterated the need to check unhealthy tendencies. In August, the Central Discipline Inspection Commission issued a notice on "strictly upholding party disciplines to check the unhealthy tendency of 'personal connections' in official business." We hope this will be a good opportunity for us to rectify our "bank style." In addition to major cases, the discipline inspection departments of banks at all levels should check these unhealthy tendencies in order to insure the smooth operation of banks.

BRIEFS

NEI MONGGOL REVENUE--By the end of October, Nei Monggol had fulfilled 79 percent of the state revenue plan and 86 percent of the industrial and commercial tax procurement plan, an increase of 30.6 million yuan or 6.5 percent over the corresponding 1980 period. By the end of October, agricultural taxes collected were 8 million yuan or 70 percent more than in the corresponding 1980 period. By the end of September, the region had discovered that 14,700 enterprises had evaded taxes totaling 37.5 million yuan. Some 18.53 million yuan of evaded taxes have been restored. [SK131122 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 11 Nov 81]

HENAN FULFILLS REVENUE QUOTAS--By the end of October, Henan Province had fulfilled 97.6 percent of the quota for industrial and commercial taxes for 1981, which is 18.7 percent more than in the corresponding period of last year. Five prefectures had overfulfilled their quotas for revenue for this year. Xuchang and Kaifeng prefectures had overfulfilled their quotas by 37 and 20 percent respectively. With the economic development, the amount of taxes has increased. The amount of taxes of this province in August and September this year was some 590 million yuan, the highest on record. In particular, this province has reaped a bumper harvest of tobacco leaves and their quality is good. The tax on each 100 jin of tobacco leaves has increased from 26.8 yuan to 33.7 yuan and the tax on each case of cigarettes has increased from 306.8 yuan to 313 yuan. The province has now overfulfilled its quotas for taxes on cigarettes and brews for this year. The amount of taxes on textiles, edible oil, chemicals, coal, electricity, metallurgical industry and construction materials is more than in the corresponding period of last year. All places have seriously inspected tax evasion and arrears of taxes and achieved good results in taxation. [HK180841 Zhengzhou Henan Provincial Service in Mandarin 1130 GMT 16 Nov 81 HK]

CSO: 4006/144

BRIEFS

XINJIANG SALT PRODUCTION--By the end of August, crude salt production in Xinjiang region was some 290,000 tons, 85.4 percent of the quota for the year and 13.18 percent more than in the corresponding period of last year. The quality of salt has been improved. [HK260803 Urumqi Xinjiang Regional Service in Mandarin 1300 GMT 8 Oct 81 HK]

XINJIANG INCREASES GOLD PRODUCTION--Xinjiang has scored pleasing achievements in this year's gold production. The region's gold production for January to September had fulfilled 284 percent of the annual plan, equivalent to the production of more than 5 years from 1976 to 1980. This year, the region readjusted the procurement price for gold and implemented various policies concerned, thus mobilizing the enthusiasm of the peasants and herdsmen in panning gold and promoting the development of gold production in the region. At present, Alatai, Tacheng and Hetian prefectures have fulfilled this year's gold production tasks ahead of schedule. [Urumqi Xinjiang Regional Service in Mandarin 1650 GMT 2 Nov 81 HK]

SICHUAN GOLD PRODUCTION--Sichuan Province has achieved outstanding results in gold production. From January to October, the province overfulfilled its gold production quota for 1981 by 145.7 percent ahead of schedule. The province's gold output in this period was 71.2 percent more than in the corresponding period of last year. [HK250927 Chengdu Sichuan Provincial Service in Mandarin 2300 GMT 14 Nov 81]

XINJIANG METALS--The Xinjiang region nonferrous and rare metals industry has steadily advanced. By the end of September, the quotas for the production of six of the nine main products for this year had been fulfilled ahead of schedule. The region had also fulfilled some 30 percent of the quotas for the production of the other three products for this year. The quality of these products had been remarkably improved. The region has overfulfilled its quota for profits for this year. [Urumqi Xinjiang Regional Service in Mandarin 1300 GMT 28 Oct 81 HK]

JILIN CONFERENCE URGES INCREASED PRODUCTION

SK280902 Changchun Jilin Provincial Service in Mandarin 1100 GMT 27 Nov 81

[Text] According to our reporters, the provincial work conference on industrial and communications production, which ended on 26 November, urged the staff and workers on the province's industrial and communications front to enhance their enthusiasm, resolutely adopt effective measures and try everything possible to wage a successful battle in industrial production during the first quarter of 1982 and gain the initiative in 1982 industrial production.

The conference began on 24 November in Changchun. Comrade (Li Dhongpu), vice chairman of the provincial economic commission, set forth a plan for 1982 first quarter industrial production. Leading comrades in charge of industrial production from municipalities and prefectures and responsible persons of the provincial bureaus, commissions, departments and offices concerned attended the meeting.

The conference earnestly summed up the experiences and lessons in this year's industrial production and devised an initial plan on 1982 first quarter industrial production. It also studied measures for fulfilling the plan. In line with the guidelines of the instructions issued by the state and provincial authorities, the conference pointed out that the guiding principle for 1982 first quarter industrial production is to comprehensively implement the eight-character policy on economic readjustment, increase the production of small commodities, daily consumer goods and small farm tools, readjust the service orientation of heavy industry, vigorously execute enterprise readjustment, improve the economic responsibility system in industrial production, improve product quality, increase the variety of goods and improve economic efficiency.

Comrade Dong Xin and (Li Zhenjiang), deputy governors, spoke. They urged leading bodies at all levels to proceed from the reality and attend to the current production task and the arrangements for next year's production. Planning, supply, commercial, financial and other relevant departments must closely cooperate with each other to fulfill the 1982 first quarter industrial production. They emphatically noted the need to devise production plans, establish contact between the producing and marketing departments, arrange raw materials and make the projects for consolidating, reforming and tapping the potential of enterprises produce the desired result as early as possible. We must strive to achieve real, unexaggerated industrial growth.

They pointed out: Fulfilling the 1982 first quarter industrial production plan is an arduous and difficult task. Leading bodies at all levels must overcome the unhealthy practice of discussing production without taking any action, discussing something without reaching a decision or adopting a decision but making no efforts to implement it. Efforts should be made to foster a fine and realistic work style, firmly strive to fulfill the 1982 first quarter industrial production plan and make a good beginning toward fulfilling next year's industrial production plans.

CSO: 4006/147

BRIEFS

SHAANXI PREFECTURE INDUSTRIAL OUTPUT--From January to October this year, Xianyang Prefecture topped all other areas in Shaanxi Province in industrial output. The total industrial output in the prefecture amounted to 359.19 million yuan, showing an increase of 6.2 percent over the corresponding period last year. The reason for this is that leaders at all levels in Xianyang Prefecture have enthusiastically helped workers and enterprises solve practical problems and seriously implement the production responsibility systems, thus enhancing the workers' enthusiasm for production. At the end of October, some units in the prefecture had already overfulfilled the year's production quotas. [HK271326 Xian Shaanxi Provincial Service in Mandarin 0500 GMT 23 Nov 81 HK]

SHANXI INDUSTRIAL PRODUCTION--In October, Shanxi Province's total industrial output value was some 955 million yuan, 2 percent more than September and 9.4 percent more than October last year. The industrial output value of the enterprises run by the central authorities, the province, prefectures. municipalities and counties in October was more than October last year. The province-run enterprises' industrial output value in October was 15 percent more than October last year and 5 percent more than September. The province's light industrial output value in October was 17 percent more than October last year while its heavy industrial output value in October was 5.8 percent more than October last year and 3.6 percent more than September. The province's output of raw coal in October was 11.46 million tons, 6 percent more than September, 16.6 percent more than October last year and some 2 million tons more than the monthly planned output. The province's electricity output in October was some 1.03 billion kilowatt-hours, 11.6 percent more than September and 8.7 percent more than October last year. [HK140742 Taiyuan Shanxi Provincial Service in Mandarin 2300 GMT 8 Nov 81 HK]

BEIJING STEEL PRODUCTION--From January to October, the Capital Iron and Steel Company earned a profit of some 250 million yuan, which was some 13 million yuan more than in the corresponding period last year. In implementing the principle of readjustment, the company's output of pig iron for 1981 will be 290,000 tons less than last year and output of steel will be some 100,000 tons less than last year. This will be a reduction of some 9 percent in the production volume of the two products compared to last year. Thus, the profit of this company for 1981 should be 8.7 percent less than last year. However, the company has decided to increase income although it has reduced production. The company originally wanted to submit a profit of 260 million yuan to the state. When the company began implementing the economic responsibility system in June, it decided to increase its anticipated profit to 270 million yuan, which will be 8.7 percent more than last year. [HK140742 Beijing City Service in Mandarin 2300 GMT 2 Nov 81 HK]

NEI MONGGOL INDUSTRIAL OUTPUT--Nei Monggol Autonomous Region has made great progress in industrial production since the beginning of the fourth quarter. According to statistics, the regional industrial output value in October was over 493 million yuan, a 6.41 percent increase over the corresponding 1980 period. By the end of October, the per quarter output value was over 4.3 billion yuan. The region fulfilled its annual industrial production plan by 80.95 percent. It fulfilled or overfulfilled its annual production plans for the 17 products, including chemical fibers, cigarettes, and leather. [SK131115 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 12 Nov 81 SK]

HEILONGJIANG INDUSTRIAL OUTPUT--Heilongjiang Province made steady progress in industrial production in October. Its output value surpassed that of corresponding 1980 period by 6.2 percent. In the January-October period, the average increase of the three quarters' output value over the corresponding 1980 periods was 2.5 percent. The increase of light and textile industrial enterprises was 15.2 percent. In the same period, the output of daily consumer goods such as wristwatches, bicycles, chemical fibers, dairy products, leather shoes and televisions surpassed that of the corresponding 1980 period by over 20 percent. In October, the province overfulfilled its monthly raw coal production plan by over 167,000 tons or 4 percent. [SK090730 Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 8 Nov 81 SK]

HUBEI INDUSTRIAL PRODUCTION--The total industrial output value of Hubei Province in October was 2.31 billion yuan, 5.8 percent more than in September and 25.1 percent more than in October last year. Due to increased production in October, the province fulfilled 81.48 percent of the quota for industrial production for this year in the period from January to October this year. Its industrial output was 7.1 percent more than in the corresponding period last year. The province has overfulfilled its quotas for the production of 29 products, including bicycles, watches, TV sets, cigarettes and sulphuric acid for this year. The profits which the state enterprises in the province submitted to the state in October were 21.3 percent more than in September. [HK140826 Wuhan Hubei Provincial Service in Mandarin 1100 GMT 6 Nov 81 HK]

'JINGJI YANJIU' DISCUSSES CAPITAL CONSTRUCTION

HK010233 Beijing JINGJI YANJIU [ECONOMIC RESEARCH] in Chinese No 10, 20 Oct 81 pp 62-64

[Article by Liang Wensen [2733 2429 2773] and Tian Jianghai [3944 3068 3189] of the Economic Research Institute of the Chinese Academy of Social Sciences: "What Is Capital Construction?"]

[Text] What is capital construction and what categories of things does it include? At present, people's theoretical understanding of this question is far from unified. In practice, there is considerable confusion about the range of things included in capital construction. This greatly hinders the strict control of the scale of capital construction and the scientific planning of the relationship between production and construction. Therefore, there is an urgent need in real economic life to clarify the meaning of capital construction. We will put forth some preliminary views for our comrades to consider.

At present, there are different concepts as to the economic category of capital construction.

The first concept is that capital construction is the expanded reproduction of fixed capital assets.

The second concept is that capital construction is simply the reproduction of fixed capital assets; that is, it includes both the expanded reproduction and the simple reproduction of fixed capital assets. Some people express this concept in the following specific terms: capital construction is the process of producing fixed capital assets and includes the renewal (including partial renewal), reconstruction, expansion and building of productive and nonproductive fixed assets in various national economic sectors.

We believe that it is incorrect to equate capital construction to the expanded reproduction of fixed assets, where the element of simple reproduction is completely precluded. However, it is also questionable whether all activities of simple reproduction of fixed assets should be included in capital construction.

As an economic activity in which fixed assets are created, capital construction specifically refers to the reproduction of fixed assets rather than the reproduction of social products in general. People's understanding on this point is basically unified. The question is whether it includes the entirety, or only a part, of the reproduction of fixed assets. The main arguments of those comrades who hold that all categories of reproduction of fixed assets should be included in capital construction are as follows: 1) Simple reproduction and expanded reproduction are only theoretical abstractions. In real life they cannot be separated. The replacement and accumulation of fixed assets are often carried out together. The formation of fixed assets, whether the replacement or for accumulation, is identical in content. Therefore, the difference between replacement and accumulation cannot be taken as a criterion for distinguishing capital construction from non-capital construction. 2) At present, the capital construction front is becoming increasingly more extensive precisely because capital construction is artificially separated from the tapping of potential, innovation and transformation. The main argument of those comrades who advocate the concept that capital construction should only include the expanded reproduction of fixed assets is that, theoretically speaking, the nature and role of simple reproduction are different from those of expanded reproduction; capital construction should belong to the category of accumulation and should be distinguished from the kind of reproduction aimed at maintaining the existing scale.

According to the first view, the renewal of, and major repairs to, fixed assets as well as the tapping of potential, innovation and transformation taking place in enterprises all belong to the category of capital construction. If so, then during the past 2 years, the scale of our country's capital construction expenditure has far exceeded 50 billion yuan, and this year the scale of capital construction expenditure cannot be kept within the limit of 30 billion yuan. If we make the scope of capital construction very wide, is this favorable to centralized administration? In particular, during the period of readjustment, is this favorable to the strict control of the scale of capital construction? On the other hand, according to the second view, there really exists the problem of how to clearly draw a line of distinction. If there is no clear line of distinction, then what one considers as a capital construction activity may be considered as an activity of tapping potential or innovation or transformation by another, and an activity that one considers should be discontinued, may need to be commenced, according to another's view. Is this conducive to controlling the scale of capital construction and to attaining an overall balance in the national economy? Because of these problems, some comrades have raised the question of whether the determination of the nature and scope of capital construction should be based on the simple reproduction and expanded reproduction of fixed assets or be based on expediency in administration? In other words, should we take it as an abstract theoretical category or as a concept related to administration?

We think that, when we study the question of what capital construction is, we should really consider many complicated factors and strive to make a specific analysis on the basis of a close integration of theory with practice. We must neither depart from the basic principle of scientifically distinguishing simple reproduction from expanded reproduction, nor simply take the difference between the simple reproduction and the expanded reproduction of fixed assets as an absolute criterion for classifying what is capital construction and what is not, thus ignoring the need for workable requirements in actual administration.

The term capital construction first appeared in the Soviet Union, in a report written by Stalin in 1926. This concept was not used by Marx, Engels or Lenin in their works. In capitalist countries, the term capital construction is not used. Instead, the concept of investment in fixed assets is used. Socialist capital construction refers to investment in fixed assets, but it cannot be thus deduced that all categories of investment in fixed assets are capital construction activities. Some comrades think that Stalin put forth the term capital construction to refer, in a sense, to the more important construction activities. We believe that capital construction is something relative to current production. It has certain qualitative characteristics. It is a special realm and an important part of national economic and social reproduction activities. Capital construction is a kind of economic activity in which fixed assets are created. Generally speaking, its substance and nature is that it involves a series of processes such as surveying, designing, construction, the purchasing and installation of machinery and equipment, and so on. From the time when preparatory work for construction is done and materials are secured, to the time when the completed fixed assets are made available to the users, there is a considerably long cycle (or time lag).

There are different categories of reproduction for fixed assets of different natures. One category involves the replacement of the means of labor, which have been accumulated in the past, so that the existing scale, in real terms, is maintained. The other category involves accumulation, with the scale of the means of labor, in real terms, being expanded. The former is the simple reproduction of fixed assets, whereas the latter is the expanded reproduction of fixed assets. The two categories are often interwoven. However, the former is the basis, and the latter expands and develops on this basis. Objectively, the process of social reproduction is very complicated. Amid these complicated phenomena and the continuous process of reproduction, those people involved in theoretical work must make abstract theoretical analyses and generalizations. They must not deal with things indiscriminately, obliterate the characteristics of, or the distinctions between various things, nor regard phenomena as the essence of things or put the incidental before the fundamental. This is disadvantageous to practical work. It is necessary and correct to consider the expanded reproduction of fixed assets as capital construction. However, it is unworkable in practice to exclude, from capital construction, all simple reproduction of fixed assets, and we also lack an adequate theoretical basis to do so. This is because some activities, such as building new mines to replace old ones, civil engineering projects undertaken to transform the existing fixed assets and so on, which belong to the category of simple reproduction of fixed assets, must be accomplished through capital construction.

If we include all the reproduction of fixed assets in capital construction, there will be many problems which cannot be satisfactorily solved.

First, comrades who adhere to the view that all reproduction must be included in capital construction, hold that it is both difficult and unnecessary to distinguish the simple reproduction of fixed assets from expanded reproduction. Actually, this is not so. The question is, what criteria are to be used for the categorization? The categorization can be made on the basis of value. (Reproduction that maintains the existing value of capital funds is simple reproduction, whereas expanded reproduction causes the value of capital funds to exceed the original level.) The categorization can also be made on the basis of use value (production capacity). (Simple reproduction results in the maintenance of the existing scale of production capacity, whereas expanded reproduction causes the scale of production capacity to surpass the original level.) The difficulty is that if technology is advancing, simple reproduction in terms of the value of capital funds often amounts to expanded reproduction in terms of use value. The converse may also occur. Under these circumstances, should a particular kind of reproduction be regarded as simple or expanded? We think that under the condition of socialism, because the aim of production is to satisfy society's and the people's needs, we should take use value as the main criterion. However, we must not ignore the reproduction of value or refrain from undertaking economic accounting. Of course, although theoretically we clearly assert that the simple reproduction of fixed assets can be distinguished from expanded reproduction, in actual work many specific problems need to be studied and solved. However, we must not negate the necessity of making a distinction, just because it is difficult to do so. Under general circumstances, in principle, the question of whether the simple reproduction of fixed assets should be carried out does not arise, because if simple reproduction is not maintained, the capital stock will diminish and production will decline. As for expanded reproduction, because it affects the ratio between accumulation and consumption, because it is related to changes in the structure of production governing various sectors or changes in the distribution of productive forces, and so on, we must exercise strict control over matters such as whether planning is necessary, what should be planned, and the quantitative aspects of our planning. Those capital construction projects which mainly belong to the category of expanded reproduction, in particular large- and medium-scale projects, affect the overall balance of the national economy, and therefore the power of making decisions about them should be centralized in the central authorities. In practive, our neglect of the renewal and transformation of old enterprises and our one-sided pursuit of starting new projects are not caused by the drawing of a line of distinction between simple reproduction and expanded reproduction. On the contrary, the cause is the neglect of the distinction between simple reproduction and expanded reproduction.

Second, there are contradictions in the arguments of those comrades who hold that all reproduction must be included in capital construction. For example, they also admit that capital construction involves processes of productive consumption which involve large quantities and long cycles. That is, magnitude and length of time are the basic characteristics which distinguish it from other categories of current production. Magnitude can be interpreted as high value of investment, large volume of work and large-scale activities. Length of time means long cycles of construction, usually exceeding 1 year. This is undoubtedly correct. However, are these basic characteristics displayed in all cases of production and reproduction of fixed assets? No, for example, these basic characteristics are not necessarily displayed when an enterprise replaces certain items of machinery or equipment on the basis of maintaining the existing scale. This may not involve a large investment, a very long construction cycle, surveying, designing or civil engineering projects. Obviously, in these circumstances, we must not regard this as a form of capital construction. However, this is a replacement of fixed assets and is a form of production and reproduction of fixed assets. As to small-scale transformations of, or innovations in, the enterprises' fixed assets, or occasional purchases of fixed assets and so on, these do not possess the above-mentioned basic characteristics, but these are instances of the production and reproduction of fixed assets.

Furthermore, those comrades who hold that all reproduction must be included in capital construction also agree that in planning, we should implement the principle of "assigning priority to simple reproduction over expanded reproduction" and "assigning priority to replacement over accumulation." However, if we adhere to the view that it is difficult and unnecessary to distinguish simple reproduction from expanded reproduction, how can such priorities exist? But facts tell us that it is impossible for us not to follow these principles. Therefore, we still need to classify capital construction activities into different forms, such as renewal, restoration, reconstruction, expansion, new projects and so on.

Subjectively, one may think that people can be reminded of the importance of capital construction. But, if various forms of reproduction of fixed assets are not studied and differentiated and if all these forms are included in the category of capital construction, the actual results will be contrary to expectations. The capital construction departments have to concern themselves with all matters, important or trivial, concerning the reproduction of fixed assets. Consequently, the satisfactory grasping and management of those capital construction projects which exhibit the above-mentioned basic characteristics is affected. "Attention is paid to the sesame seeds but the watermelons are overlooked." The gains cannot offset the losses. Moreover, the importance of capital construction, and also its important role in the achievement of the expanded reproduction of fixed assets, are weakened. Actually, this amounts to obliterating the economic nature of capital construction as the principal form of accumulation of fixed assets.

Our overall view is that capital construction mainly refers to the construction, acquisition and installation of new fixed assets. Generally, it involves a series of processes such as surveying, designing, construction, the purchase of equipment, installation and so on. It exhibits characteristics such as relatively long construction cycles and relatively large investments. All such economic activities, in which fixed assets are created, including a part of the replacement of fixed assets and the entirety of the accumulation of fixed assets, should be regarded as capital construction. However, capital construction is principally the accumulation of fixed assets. That is to say, although it may include a certain part of the simple reproduction of fixed assets, its principal form is the expanded reproduction of fixed assets.

After recognizing its qualitative characteristics, we should also assign quantitative characteristics to it. For example, in the light of different industries and different circumstances, we should specify certain investment figures, or certain sizes of construction areas, or certain quantitative increases in the production capacity. We should also sort out those technological measures which belong to the realm of capital construction and thus eliminate the state of confusion caused by "small-scale capital construction employing large-scale projects technological measures." In real life, some specific limits will be accompanied by a lack of clear-cut delimitation or by the existence of borderline cases. However, various items can still be categorized on a broad basis. For example, certain categories of major repairs (such as major repairs to blast furnaces, the rebuilding of factory buildings and so on), the overall transformation of old factories, the building of principal or independent workshops and so on, should be included in capital construction. The simple reproduction of some other fixed assets should not be included in capital construction. If we can relatively clearly define the nature and scope of capital construction on the basis of integration of theory with practice, this will be conducive to reducing the overly large scale of capital construction and fulfilling the task of further readjusting the national economy. Moreover, we can correctly plan the relationship between production and construction in our long-term planning.

[Footnote]: Whether the use of the term "capital construction" should be continued has been discussed in other articles. Even if it is replaced by some other term, some practical problems which were raised in this article require further study.

BRIEFS

KUNMING URBAN CONSTRUCTION MEETING--On 11 November, the Kunming Municipal CCP Committee sponsored and held a meeting on urban construction management. The meeting put forward specific measures for doing well in urban construction management and demanded that all units support this work in the municipality. Kunming Municipal CCP Committee first secretary Li Yuan gave a report on the situation of urban construction management in the municipality over the past few years and on the development of urban construction management. Governor Liu Minghui attended and spoke. [HK250927 Kunming Yunnan Provincial Service in Mandarin 1100 GMT 15 Nov 81 HK]

SHENYANG UNDERGROUND PASSAGE--A new underground passage has been constructed near the Shenyang railway station. The underground passage has two outlets, each of which is 64.8 meters long, 6 meters wide and 3.2 meters high. The inauguration ceremony was held 14 November. It was attended by provincial and Shenyang municipal leading comrades, including Li Tao, Xie Huangtian, Zhu Weiren, Xiao Zuohan and Deng Zhongru. Wang Danpo, acting mayor of Shenyang Municipality, cut the ribbon. [SK170558 Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 14 Nov 81 SK]

DOMESTIC TRADE

BRIEFS

LIAONING SCRAP MATERIALS--Liaoning Province has prefulfilled and overfulfilled its annual purchase and sale plans for old and scrap materials. According to statistics compiled at the end of October, purchase value reached 160,700,000 yuan, a 6.2 percent increase over the corresponding 1980 period. Sale value was 189,150,000 yuan, a 3.9 percent increase over the annual sale plan and an 8.1 percent increase over the corresponding 1980 period. In the first 10 months of the year, the province supplied 798,000 tons of raw materials derived from old and scrap materials to its industrial enterprises, a 5.3 percent increase over the corresponding 1980 period. [SK171154 Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 16 Nov 81]

HEILONGJIANG PRICE READJUSTMENT--In accordance with the guidelines of the State Council circular, the Heilongjiang provincial people's government issued a circular that the province will lower prices for polyster-cotton and ployster-viscose fabrics and increase prices for alcoholic drinks and cigarettes on 18 November. In recent years, our country has witnessed rapid development of the chemical fiber industry. Both the output and production capacity of the chemical fiber industry have doubled. However, higher existing prices have discouraged consumption somewhat. Therefore, the State Council decided to lower the selling prices for polyster-cotton and ployster-viscose fabrics to boost the sales of chemical fabrics. [SK182234 Harbin Heilongjiang Provincial Service in Mandarin 2200 GMT 17 Nov 81]

GUANGDONG INSPECTING MARKET PRICES--On 19 November, the Guangdong Provincial People's Government issued a circular on inspecting market prices. The circular pointed out that the inspection aimed at investigating the supply and management of the consumer goods and aquatic products for which the prices should remain stable according to a circular of the provincial people's government on stabilizing market prices. Anyone violating the regulations of the circular must be rectified, while models should be recommended. The price inspection group will conduct inspections in the three municipalities of Guangzhou, Shantou and Zhanjiang. The provincial people's government demanded that all commission offices and all county and municipal people's governments organize the relevant departments to launch inspection of market prices. It also plans to convene a meeting to study how to further stabilize market prices in late November. [Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 20 Nov 81 HK]

I

Trade terms, also called the comparative prices of import and export goods, refer to a comparison between the total export price level with the total import price level of a country (or a region). It is an important comprehensive index reflecting and measuring the advantages and disadvantages brought about by the import and export prices in the foreign trade of a country, and serves as a guidance in the development of its foreign trade.

In the 1970's, changes in the terms of foreign trade in our country were as follows:

Chinese Trade Terms 1970-1980
(197- = 100)

Year	Total Export Index	Total Import Index	Trade Terms
71	95.0	93.6	101.5
72	102.0	96.7	105.5
73	156.7	125.1	125.3
74	206.6	176.0	117.4
75	198.2	188.8	105.0
76	186.0	159.7	116.5
77	219.3	160.7	136.5
78	236.7	177.1	133.7
79	264.1	220.2	119.9
80	292.3	257.8	113.4

The above trade terms are based on the price indexes of the principal import and export commodities from 1970 to 1980 in our country as compiled by the Comprehensive Planning Bureau of the Ministry of Foreign Trade. A total of 73 principal exported items were selected for compiling the export price index, and their export value amounted to approximately 50-60 percent of our total export value. Therefore, the trade terms computed on this basis have a representative character.

Judging from the entire 1970's, we can see that our trade terms were on the whole favorable. If 100 is used as the base figure in 1970, then the comparative prices throughout the 10 years were more than 100. In other words, for every 100 units of exported goods, we could bring back more than 100 units of imported goods. In the last 3 years, however, the terms turned out to be unfavorable. If 100 serves as the base figure of 1977, then the figures for the years 1978, 1979 and 1980 would be below 100.

The changes of comparative prices in our imports and exports from 1970 to 1972 were insignificant. In 1973, when the Western economy was on a periodical rise, the worldwide currency inflation became intensified, and the world market prices soared. There was a general increase of 53.6 percent in our export prices against a general increase of 29.3 percent of our import prices. Since our export prices rose much faster than our import prices, our comparative import-export prices rose to 125.3. In 1974 and 1975, when the Western countries faced a very serious economic crisis after the war, there was a marked reduction of commodity prices in the world market. In 1975, our general export prices dropped by 4.1 percent, but the general import prices did not show any corresponding drop. Therefore, the comparative import-export prices dropped to 105.0. In 1976, our general export prices continued to drop by 6.2 percent, but the drop in the general import prices was even bigger--as much as 15.3 percent--and our comparative import-export price rose to 116.5. In 1976, the Western economy began to recover with an upswing in world market prices. In 1977, our comparative import-export price rose by 17.9 percent, and the rise of the general im port price was very minor. Thus our comparative import-export price rose to 136.5, the peak figure in the 1970's. After 1978, the rise of our export prices was not so much as that of our import prices. In the 3 years from 1978 to 1980, the general export prices rose by 7.9 percent, 11.5 percent and 10.6 percent respectively, while the general import price rose by 10.2 percent, 24.3 percent and 17 percent respectively. Therefore, our trade terms turned unfavorable. If we changed the base period, the unfavorable situation would be even more obvious. Now, if we take 100 as the base figure for 1977, the figures for 1978, 1979 and 1980 will be down to 97.9, 76.9 and 83.1, with a marked downward trend every year. This change should deserve due attention. (Refer to the following table)

China's Trade Terms 1977-1978
[as published]

Year	Total Export Index	Total Import Index	Trade Terms
77	100	100	100
78	107.9	110.2	97.9
79	120.4	137.0	87.9
80	133.3	160.4	83.1

The changes in our trade terms during the 1970's were different from those of many developing countries. Aside from the effects of price changes in the world market, our changes were largely related to the structure of our exported products which was neither vertical nor horizontal. Unlike many other developing countries which mainly carried on the exchange of primary products for finished products, or simply the exchange of finished products, ours is mostly an exchange of primary products.

In the 1970's, our main export products were agricultural byproducts, native and animal products, foodstuffs, processed agricultural byproducts, primary petroleum and mineral products and primary light and textile industrial products. Primary products accounted for more than one-half of our total exports. Our imported products were mainly industrial raw materials and consumer goods, such as wheat, cotton, sugar, animal and plant oil, iron ores, pig iron, rolled steel, chemical fertilizers, chemical fibers, wool, artificial cotton, rubber, paper pulp, paper, plastic raw materials, copper, aluminum, lead, nickel, phosphate, timber, leather and jute. All these raw materials and agricultural products were primary products, and they accounted for more than one-half of our total imports. Machinery, electrical appliances, instruments, complete sets of equipment and advanced technology amounted to only about 20 percent of our imports. Since the changes in the varieties and specifications of these imported commodities almost every year made a comparison difficult, we have excluded them from the import price indexes listed in the above tables. If they are included, the comparative prices may turn out to be even more unfavorable. Since more than one-half of our imported and exported goods were primary products, it can be said that our import and export is mainly the exchange of primary products (agricultural byproducts, native products, special products, mineral products and fuel), for other primary products (industrial raw materials, food, cotton, sugar and other agricultural products in large amounts).

Based on this structure of import-export commodities, the changes in our trade terms are different from those of many developing countries as well as those of many developed countries. Before 1977, our export prices generally rose faster than our import prices. From 1970 to 1977, the export prices of our native and animal products and foodstuff, such as rice, broad beans, edible oil, peanuts, pond fish, miscellaneous beans, tung oil, rabbit meat, pork, tea, honey, almond, edible fungus, while melon seeds, cured tobacco, tangerines, apples, frozen prawns, dried chilli, down, rabbit fur, cashmere, goatskin and rugs were more than doubled, and some of them were even trebled or quadrupled. The prices of mineral products, such as tin, tungsten ores, coal, coke, cement, tar and paraffin were also more than doubled. The margin of price increase for some light industrial goods was quite wide because their previous prices had been set too low. The increase of handicraft product prices was also quite large. Furthermore, some raw materials and foodstuff were changed to semifinished products, processed products and small packaged commodities for export with higher prices. Except for cobalt, phosphate, iron ores, paper, cotton, wool, artificial silk, artificial cotton, coffee, cocoa, sisal hemp, rolled steel, copper, aluminum and some other nonferrous metals, the import prices of many principal items such a rubber, pulp, timbers, wheat, animal and plant oil, sugar, jute and mahy others were never more than doubled throughout the period 1970-77. Therefore, the trade terms in 1977 were favorable to us.

The situation, however, changed after 1977, and the favorable conditions turned unfavorable. The in crease in import prices was more than in export prices, because of the sharp rise in the world market prices of grain, sugar, oil, cotton, chemical fertilizer, chemical fibers, rubber, iron ore, phosphate, and paper--which accounted for more than one-half of our total imports. On the other hand, with the exception of petroleum which was sold at a largely increased price, our main exported products, such as light and textile industrial goods, chemical industrial products, machinery, mineral metals, agricultural byproducts, native and animal products, handicraft products, handicraft products, edible oil and some foodstuff, were sold at only slightly increased prices, although world market prices for these items were, generally, on an upward trend. The main reasons were as follows: First, most of our exported finished products and processed agricultural byproducts were of a low grade. Because of inferior quality or performance, lack of variety and poor packing, they failed to meet the foreign market demand. Therefore, the margin of price increase for these products continued to shrink. Our export price index is based on the average per-unit price of exported products. Since these products were of a low grade and had a small range of specifications, the average per-unit price had to be low. In the present world market, there is an increasing demand for goods of a high grade, fine quality and large variety. The better the quality of high-grade goods, the greater wll be the sales, and the wider will be the margin of price increase. On the other hand, sales of low-grade goods are poor and their prices cannot be high. Our exported light and textile industrial goods, for example, were generally goods of the lower-middle grade or semiprocessed products with little improvement in quality or change in specifications and style for many years. Some light industrial products remained unchanged for as long as 10 or 20 years, while our chemical-industrial products were mostly of the inorganic type in a primary form. Most of the machinery exported was also a primary product. In view of the odds against us in a competition in which "only fine quality counts," it was hard for us to increase our prices. The quality of some agricultural byproducts, such as black tea, tobacco, honey and pork, has also remained unchanged for many years. That is why since 1977, the average price of our exported goods, with the exception of animal products, has increased only slightly. This was particularly true of foodstuff and processed foodstuff. Secondly, in view of the keen competition in the world market and the rise of trade protectionism, restriction on imports continued to tighten. The United States and the European Common Market even imposed import quotas on textile goods, thus adding to the difficulties of our sales. In the case of light and textile industrial products of the lower-middle grade, not only have there been strict restrictions on imports but also growing competition from many developing countries whose light and textile industrial products are now finding their way into the world market in increasing quantities. All this was unfavorable for our price increase. Thirdly, our export trade was penalized by the terms of delivery. Since our delivery was always behind date, customers did not receive goods intended for the summer season until the arrival of winter, and the goods received did not measure up to the standards of quality and packing as specified in the contracts. Furthermore, not many of our products were readily marketable, and if we had to push the sales of our slow-selling products in the face of strong competition, it would be very difficult to increase their prices. To offset these disadvantages, it was even neessary to cut our prices in order to clear up the overstocked goods. Fourthly, the processing of imported materials contributed to the major portion of our total export value. In recent years, increase in the prices of imported raw materials was larger than the increase of the prices of our exported finished products. Thus the price differential between our exported finished products and our imported raw materials (mainly imported cotton and exported cotton textile goods) became reduced. In other words, the additional value of our products became lower, and this accounted for the unfavorable trend of the comparative prices of imported and exported goods of this type in the past 3 years. Furthermore, the export of some traditional agricultural products, such as rice, broad beans, tung oil and edible oil--which were exported in huge quantities and which brought in a great deal of foreign exchange earnings--has been reduced, and there were certain problems with our foreign trade system, our business management and our pricing.

These were the main reasons for the unfavorable trend of our trade terms in the past 3 years as well as the main obstacle to the futther expansion of our export trade.

II

In the 1980's, unfavorable trade terms for the majority of developing countries are expected to continue. The main cause of this unfavorable trend is that in addition to the disadvantage brought about by the exchange of primary products for finished products to the country which exports primary products, in international trade there is still a disadvantage to developing countries in their exchange of their finished products for the finished products of the industrially developed countries. During the 1980's predictably the developing countries will further increase the export of their finished products to developed countries. Since these exported products mostly consist of light and textile industrial goods and primary machinery, all calling for high labor intensity and having a low additional value, while, on the other hand, the finished products exported by the advanced industrial countries to the developing countries are mostly heavy industrial products of high precision calling for a concentration of technical and financial resources, and having a high additional value, the exchange between high-grade and low-grade finished products will become an exchange of unequal values. South Korea, for example, became one of the regions with the fastest growth of export trade in the 1970's. Its exports consisted mostly of light and textile industrial products and primary machinery products, which accounted for more than 60 percent of its total exports. Since increase in the prices of these exported low-grade products of high labor intensity was far less than that of the imported heavy industrial goods of high-precision and high-grade, or that of imported capital equipment and energy, its trade terms tended to be unfavorable. In Taiwan, again, there was a fairly rapid growth in the export of finished products, mainly light and textile industrial products of high labor intensity. As a result of the exchange between low-grade finished products on the one hand and capital equipment of high technology, expensive energy and industrial raw materials on the other, its import price index last year was up 22.5 percent, while its export price was up only 11.2 percent--an obvious deterioration of trade terms. Similar conditions existed in other fairly rapidly developing countries and regions.

There are many similarities as well as differences between the trade terms of China and those of many other developing countries in the 1980's. The extent of these similarities and differences will be determined by the changes in the structure of our exports and the improvement of our foreign trade management. At present, there is backwardness not only in our export trade, but also in our import structure which is even low grade. Because of the further readjustment of our national economy now going on, no major changes in these structures are expected in the first half of the 1980's. It is anticipated that along with the readjustment and rationalization of the production structure at home, there will be a corresponding growth of exports. The demand of a population of 1 billion on the home market will bring about a continued drop in the export of food and raw materials, and large-scale exports of traditional agricultural products can hardly be expected to increase. The growth of energy export may not continue; instead, it may level off or even decline. As for imports, it is not likely that the large transactions of industrial raw materials, chemical fertilizers, grain, cotton, oil and other agricultural products will be reduced in the near future. Furthermore, the importation of durable consumer goods, such as TV sets, radio-recorders, wrist watches, refrigerators, and so forth, will be further increased as a support for the home market and to help in currency withdrawal. There will however be no appreciable increase in the importation of such capital goods as machinery, electrical appliances, instruments and complete sets of equipment for some time because of the reduction of capital construction projects and the reorganization of heavy industry. Under such conditions, our trade terms may continue to deteriorate. In the 1980's commodity prices in the world market will tend to rise, and the prices of heavy industrial, high technology products, capital equipment and other high-grade finished products will increase faster than those of the light and textile industrial products of high labor intensity. Therefore, the prices of high-grade and high-precision machinery will increase faster than that of the primary and common machinery, and the prices of industrial raw materials, chemical fertilizers, and grain which are imported in large quantities will rise faster than those of our agricultural byproducts, native products and light and textile industrial products. Even the prices of animal products will not increase in the way they did in the 1970's. It is estimated that during the second half of the 1980's, there will be increases in the export of our light and textile industrial products and machinery along with the increased importation of advanced technology and capital equipment; and it may be difficult to turn the trade terms to our advantage. This question will however be decided by: (1) the improvement of quality, specifications, performances, designs and packings of our exported light and textile industrial products and machinery; a continual upgrading of these products; and a reform of our product mix with the addition of more easily marketable, high-grade and fine quality goods and the reduction of low-grade and low-price products for export along with the improvement of management and constant reduction of production costs; (2) a gradual production for export; (3) the increase of the additional value of finished products made from processed imported materials; and (4) the gradual reduction of importation of consumer goods and agricultural products now being imported in large quantities. We must fundamentally change the structure of our exported goods before we can achieve favorable trade terms.

FOREIGN TRADE

THIRTY MEMBER TEAM INVESTIGATES GUANGDONG SPECIAL ECONOMIC ZONES

Guangzhou YANGCHENG WANBAO in Chinese 30 Sep 81 p 2

[Article by Zeng Muye [2582 3668 6851]: "An Investigative Study of the Special Economic Zones]

[Text] In order to do a good job of building the special economic zones, the relevant departments in Guangdong Province recently organized nearly thirty economists and economic workers to go to the Shenzhen and Zhuhai special zones to carry out an 18-day investigative study. This activity has made us feel deeply the necessity and urgency of developing investigative studies on the economic zones.

One of the significances of these investigative studies is that they deepen our understanding of the Historical Resolution of the Central Committee. Two years have passed since we resolved to set up "special economic zones." During these two years, the province has persisted in carrying out the strategic decision of the Central Committee and gained valuable experience. In addition, the municipalities of Shenzhen and Zhuhai as well as the cadres and workers of the two special zones have moved heaven and earth, blazed the tough new trail, dared to innovate and achieved preliminary results. Over the past two years, Shenzhen Municipality has taken in 720 foreign capital import projects with a total investment capital of over 2.3 billion Hong Kong dollars according to the signed contracts. Included among these are projects to process and assemble imported materials, to cultivate imported aquatic products and for compensatory trade. There are cooperative ventures, joint-capital ventures and single investor ventures. In the past more than two years Zhuhai Municipality has imported 200 projects with a total capital investment of over U.S. $150,000,000. Of particular value has been that the "trailblazers" have acted in the spirit to "seize the day, seize the hour" and simultaneously drafted plans, signed contracts, engaged in construction and put projects into operation. Shenzhen Municipality has already finished deliberations on 720 imported projects of which 548 are already in operation and 95 are being built. Although some larger projects are still being built in Zhuhai Municipality, the majority of projects are now in operation. In both of these cities the original industrial and agricultural base was relatively weak, but after two years of importing and construction, they have already set up industries for home electrical appliances, light industrial and textile goods, construction materials, food and beverages, everyday furniture and tourism. They have developed export trade, aquatic products and commune and brigade industries. Industrial and agricultural production and financial revenue have all greatly increased, creating an impressive foreign exchange income for the state. At the same time, all of the initiative and management powers for economic activities within the special zones have remained in our hands, that is to say that it is the Chinese government which exercises sovereignty and all of the economic activities within the zones must operate within the bounds permitted by China's laws (including the special regulations for the zones). In no way is it the "colonial economy" that some have called it. It is extremely important to unify our understanding on this question as a prerequisite to our correctly summing up our experience in our present and future studies of the relevant policies, institutions and theoretical questions pertaining to the speical economic zones. It will also help us resolve some splits in theoretical viewpoints. Of course, we do not want to sidestep the deficiencies in our work and pave the way for some passive social phenomena and social questions which the zones have brought with them.

The second significance of these investigative studies is that they sum up and investigate experiences in building up the special economic zones. Besides the general aspects of clarifying the nature, position and function of the zones together with their forms, economic structures and struggles against corruption, it is extremely necessary to focus our study and summing up on the following questions. In production: 1. enterprise management in the zones, particularly the management experiences of the jointly operated and single investor ventures; 2. reforms in labor management and the wage systems in the zones; 3. how agricultural production outside the zones in the two municipalities of Shenzhen and Zhuhai meets the demands of zonal development; 4. the development of tourism in the special zones; 5. land prices in the zones; 6. the economic results of zonal importing work and the interrelationship between zonal imports and the development of economic alliances domestically; and 7. the relationship between zonal construction and that of the inland or the core city (Guangzhou). In circulation: 1. how the special economic zones can make the transition from the present system where regulation by plan is primary to one where market regulation is primary; 2. expanding the export foreign exchange receipts of the zones and enlarging their self-determination in foreign trade; 3. market supply, price management and the arrangements for people's livelihood in the zones. In finance and banking: 1. the monetary system, banking system and foreign exchange management in the zones; zonal tax collection policies and systems as well as financial management systems; together with experiences in negotiating and signing contracts, the economic effects of second line construction, and the like.

It has been two years since Guangdong Province set up the Shenzhen and Zhuhai special zones (plans and preparations are now being made for the Shantou special economic zone). The numerous phenomena which have developed before our eyes require us to go look into them, refine them and generalize them so as to form a theory on the construction of Chinese-style "special economic zones." This task has been set before us repeatedly by the party. During the "four modernizations" we should continuously study new situations, sum up new experiences and seek out a highly effective path for developing the economy. Systematically developing our investigative studies of the special economic zones and proposing a set of theories on their construction is our long-term task. Our economic theorists and practicioners have an unshirkable responsibility. We should spare no effort to complete this glorious task ahead of time.

GUANGZHOU NOT MAKING FULL USE OF ZHUHAI SPECIAL ECONOMIC ZONE

Guangzhou GUANGZHOU RIBAO in Chinese 29 Sep 81 p 2

[Article: "Zhuhai Special Zone Urgently Needs Guangzhou Support"]

[Text] A reporter for this newspaper recently interviewed relevant leading comrades of Zhuhai Municipality and some comrades from Guangdong Province and Guangzhou Municipality who were in Zhuhai on business. They all felt that Guangzhou has a responsibility to support Zhuhai and that it can reap rewards from making use of Zhuhai.

Zhuhai is a new city with a population of 150,000, the vast majority of whom are peasants, fishers and floating fishers. The urban population is only 38,000.

Zhuhai, at the estuary of the Pearl River, is linked by land to Macao and by sea to Hong Kong. Besides being an important port of entry for Hong Kong and Macao, it is a scenic tourist spot with excellent prospects for development. Since the CCP Central Committee and the State Council approved the trial establishment of a special economic zone in Zhuhai in 1979, the local people have been resolved to make full use of the advantages of their zone to transform Zhuhai into an export commodity base which combines agriculture and industry at a relatively high level, a tourist area for visitors from Hong Kong and Macao and a new-style border city and special economic zone. Relevant leading comrades of Zhuhai Municipality told our reporter that the city's total value of agricultural, industrial and fishery output last year was over 60 percent greater than in 1978 and that electronics, woolens, cotton textile and clothing industries are mushrooming. Last year they received a total of 390,000 visits from foreigners, overseas Chinese and tourists from Hong Kong and Macao. The first half of this year the number of visits was double that of the same period last year. The municipality's construction is developing like bamboo shoots after a spring rain.

Zhuhai has run into one especially noteworty problem in developing its economic construction and tourist industry, a shortage of skilled labor. It urgently needs the forceful support of order cities, in particular, Guangzhou. The comrades in Zhuhai Municipality said that when First Secretary Liang Lingguang and others of the Guangzhou CCP Municipal Committee have come to visit, they have expressed the notion that Guangzhou must make great efforts to support Zhuhai, and in reality Guangzhou has given quite a bit of support to Zhuhai. During the course of his visit, our reporter discovered many areas where Zhuhai's capabilities are weak and where Guangzhou is responsible for helping them. For example, Zhuhai's industry is developing from nothing. Besides entering into cooperative arrangements with Hong Kong and Macao, they would like to cooperate with Guangzhou. In the entire municipality of Zhuhai, there is not one Western-style clothing store, high-level haircutting establishment or photographic studio which can develop and print color film, and there are very few high-level physicians. In all these areas Zhuhai urgently needs Guangzhou's help. Construction development is quite rapid in Zhuhai, where 20 tourist spots are planned or being built; this also urgently requires further help from Guangzhou.

As our reporter saw, some facts show that some units in Guangzhou have already begun to pay serious attention to utilizing Zhuhai. For example, in Gongbei, billboards have been posted advertising Qingnian brand ballpoint pens, pearl ointment, Mingzhu brand watches, essence of Chinese caterpillar fungus and chicken and Chinese angelica essence, all Guangzhou products, yet the actual utilization of the favorable conditions of Zhuhai has yet to begin. In Gongbei, Xiangzhou and Qianshan, our reporter only saw one salesroom from Guangzhou, for the educated youth farm of the Yuzhu lumber yard. Upon inquiring, he found that this salesroom does not actually belong to Guangzhou Municipality, but is under the management of the provincial Forestry Department. In their briefing, comrades of Zhuhai Municipality said that Beijing's Chinese medicine trades and the renowned Quanjude Beijing Duck Restaurant are preparing to set up stores in Gongbei with all of the merchandise as well as the raw materials and materials for preparation being shipped directly from Beijing. Before long a roast duck branch may be operating, but our reporter heard no reports in Zhuhai of Guangzhou Municipality making similar plans. People commented that our comrades in Beijing could see the 14,000 Chinese and foreign visitors now entering Gongbei daily from Macao and have come from far away to set up stores to sell Chinese medicine and roast duck, so why is it impossible for Guangzhou which is close at hand to come here and set up stores and restaurants to sell Chinese medicines and Guangdong chicken specialties such as Wenchang chicken, cuipi [crispy skin] chicken, yanju [salt baked] chicken or Taiye chicken? Why can't some renowned restaurants from Guangdong, Hong Kong or Macao set up a branch in Zhuhai?

BRIEFS

GUANGDONG FOREIGN TRADE--By the end of October, the Guangdong provincial foreign trade system had fulfilled its quotas for procuring and exporting products. The amount of products procured in this period for export was an increase of 13.2 percent over the same period last year. The amount of foreign currency income derived from exports increased by some 20 percent. The quantity of goods exported to Hong Kong and Macao increased by 27.4 percent. [HK140820 Guangzhou Guangdong Provincial Service in Mandarin 1000 GMT 11 Nov 81 HK]

SHANDONG PIG IRON EXPORTS--Pig iron produced by Shandong Province has made inroads into the international markets and earned large amounts of foreign exchange for the state. Pig iron was until recently not listed as an export item. Since the beginning of this year, the Shandong metals and minerals import and export corporation has made vigorous efforts to promote pig iron exports. By the end of October, the corporation had exported 40,000 tons of pig iron to Japan, Hong Kong, Malaysia and other areas or countries. [SK182230 Jinan Shandong Provincial Service in Mandarin 2300 GMT 17 Nov 81 SK]

TOURISTS IN SHANGHAI--Beijing, 8 Nov (XINHUA)--Shanghai received to total of 217,900 foreign and overseas Chinese tourists in the first ten months of this year, 25.92 percent more than in the same 1980 period, according to the CHINA FINANCE AND TRADE JOURNAL. The total income in foreign exchange that the city earned from tourism in the January-September period was equivalent to 115.3 million yuan (RMB), 30.6 percent up compared to the corresponding 1980 figure, said the Beijing-based journal. The annual rate of increase over the past three years in the number of tourists that Shanghai has received is greater than the average rate for the world, the journal said. Deputy Mayor Han Zheyi said last week that Shanghai is determined to expand tourism taking advantage of its favourable conditions, including a fairly developed industry and relatively sufficient accommodation facilities. [Excerpt] [OW100813 Beijing XINHUA in English 0254 GMT 9 Nov 81 OW]

SHAANXI PROMOTES EXPORTS--At the 50th Chinese Export Commodity Fair in Guangzhou, many transactions for Shaanxi Province's exported goods were concluded. By 10 November, transactions for 14 million dollars worth of this province's exported goods had been concluded. This amount exceeded the total amount of this province's goods exported at last falls Guangzhou fair. These exported goods included cashmere, melon seeds, cotton yarn, red beans, knitwear, minerals and light industrial products. [Xian Shaanxi Provincial Service in Mandarin 0500 GMT 15 Nov 81]

GUANGDONG FOREIGN TRADE--Guangdong scored good results in foreign trade. By the end of October, the province had already fulfilled 102.2 percent of the year's quota, which is 19.17 percent up on the same period last year. Guangzhou, Huiyang, Foshan, Zhaoqing, Zhanjiang, Hainan, Shenzhen and Zhuhai have all fulfilled export quotas ahead of schedule. The processing industry using imported materials has increased by 62.6 percent over the same period last year. Compensation trade has increased by 191.4 percent over the same period last year. [Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 18 Nov 81 HK]

CSO: 4006/144

BRIEFS

SICHUAN EMPLOYMENT TASK--The labor departments of all localities in Sichuan Province have scored good results in arranging jobs by integrating the policies of having the labor departments assigning people to certain posts, having the individuals organizing themselves to run collectives and having the individuals set up self-employed businesses. From January to October this year, jobs have been arranged for some 190,000 people. In some localities and counties, people who were unemployed since 1979 have now been assigned jobs. This plays an important role in promoting social security and enlivening economy. In implementing the policy to arrange jobs, all localities have focused on encouraging the unemployed youths to organize themselves to run collective businesses. At the same time, they are encouraged to seek jobs themselves and set up self-employed businesses. [HK271252 Changdu Sichuan Provincial Service in Mandarin 2300 GMT 25 Nov 81 HK]

CSO: 4006/147

BRIEFS

FUJIAN AIRPORT EXPANSION--The Fuzhou airport expansion project is making good progress. The project, including extension of the runway, taxiways and so forth, involves pouring 58,000 cubic meters of concrete and 98,000 cubic meters of earthwork. The project is scheduled for completion before 1 May 1982. [OW091027 Fuzhou Fujian Provincial Service in Mandarin 1120 GMT 7 Nov 81 OW]

SICHUAN PASSENGER TRANSPORT--Since the beginning of this year, shipping departments in Sichuan Province have done well in developing industrial and agricultural production, urban and rural trade and tourism. They have vigorously done well in passenger transport. Eighty-four state and collective shipping enterprises in 12 prefectures and municipalities, including Leshan, Yibin, Nanchong, Yongchuan, Daxian, Fuling, Wanxian, Mianyang, Neijiang and Chongqing, in the province are engaged in passenger transport. They have 234 passenger ships, which sail on 26 large and small rivers, including the Changjiang, Jinshajiang, Jialingjiang, Minjiang, Tuojiang and Daninghe. These ships transport about 80,000 passengers every day. From January to October this year, these ships transported some 28.6 million passengers, 112 percent of the passenger transport quota for 1981. The province overfulfilled its passenger transport quota for this year 2 months ahead of schedule. [HK250927 Chengdu Sichuan Provincial Service in Mandarin 2300 GMT 14 Nov 81 HK]

LIAONING AVIATION PERSONNEL--On 9 November 1949, about 3,000 personnel of the former China Air Lines and Central Air Lines under the Kuomintang revolted in Hong Kong. Some of them flew 12 planes to new China. In the past 30 years, these personnel coming to our country have studied and worked diligently under the leadership of the party and have made due contributions to the socialist revolution and construction. Some have become engineers, accountants and communist party members. On the morning of 23 November, the Shenyang Civil Aviation Administrative Bureau held a meeting to issue certificates to 11 persons to identify them as personnel who revolted in Hong Kong and crossed over to China in 1949. Attending the meeting were Zhu Chuan, Standing Committee member of the provincial CCP committee and deputy governor of the province; Fang Ming, vice chairman of the provincial CPPCC committee; and (Liu Xingkui), deputy director of the united front work department of the provincial CCP committee. EXPERIMENTS IN ECONOMIC RESPONSIBILITY SYSTEM REPORTED

Beijing ZHONGGUO CAIMAO BAO in Chinese 29 Sep 81 p 3

[Article by Wan Dianwu [8001 0368 2976] and Zhang Caiqing [1728 6846 1987]: "Results Remarkable; More Active Guidance Needed--Investigative Report on Experiments in System of Management Responsibility Among Liaoning Provincial Commercial Departments"]

> [Text] Editorial note: Adopting a system of management responsibility in commerce is a great event which must be actively and yet cautiously dealt with in the spirit of "subjecting everything to a practical test." We will continue to publish articles and investigative reports [on this subject] for our readers' study and reference.

Adoption of the system of management responsibility by commercial departments is an important reform in commercial work. From May to July, the Liaoning Provincial Commercial Bureau conducted experiments in the system of responsibility for business management among its 2,676 affiliated units. Although the experimental period was very brief, and the system needs to be further improved, remarkable economic results have already been gained. This is a proof of the correctness of the reform.

1. The integration of authority, responsibility and benefits has aroused the enthusiasm of the enterprises and their workers in business management. In the past, the enterprises and workers practiced equalitarianism by "eating out of the same pot." Since the enforcement of the system of responsibility for business management, the passive position of the enterprises has been replaced by an active one, while the attitude of workers has turned from negative to positive. Both the enterprise and the workers outlook has changed markedly, and many longstanding problems have been rapidly solved. Previously, the cadres and workers chose only the easy jobs and avoided the hard ones. This practice is now rare, and the number of those taking sick leave or showing up only to loaf around is much reduced. Now, the workers are coming on duty early, leaving late, and working on Sundays. Even minor ailments do not keep them away from work. Many loafers have become hard workers, and the attendance rate has increased from 80 percent to approximately 95 percent. In June, 88 stores under the Dadong District Nonstaple Food Company of Shenyang dispatched 1,690 mobile vendor carts--the largest number of carts ever dispatched--[to serve the public]. The system of awarding a bonus in relation to the curtailment of expenses encouraged the workers to practice economy in running their stores. Such unhealthy tendencies as helping oneself to the stores' merchandise or causing

damage to store property have taken a healthy turn. In the past, the loss was only to the "public"; now all workers have to share the loss and therefore they supervise one another.

2. The state receives more revenue, the enterprise retains more profits, and the workers have a better income. Except for some isolated cases where the units' shares are too low and the workers' shares are too high, the vast majority of the experimental units have increased their profits by a wide margin and distributed more for the state and the enterprises than for the workers, so that all three parties are duly rewarded. The Fushun Municipal Nonstaple Food Company, for example, adopted the responsibility system among its 89 affiliated units in June. Compared with the preceding month, the profits handed over to the state increased from 46,000 yuan to 65,000 yuan; the retained profits increased from 10,000 to 25,000 yuan; and the profits shared by the workers and staff members increased from 20,000 to 35,000 yuan. The bonus received by each worker to staff member was increased from 8 yuan to 20.01 yuan. In July, the chain of food and drink stores in Shenhe District of Shenyang Municipality tried out the system of responsibility for sales to be undertaken by each group (and individual) whereby above-quota sales would be rewarded and failure to fulfill the quota would be punished. Compared with June, the volume of sales in July increased by 13.5 percent; the expenditures were reduced by 1.14 percent; and the profits increased from 2,580 to 5,320 yuan, at a rate of 106 percent. In the distribution of profits, the amount of tax increased by 131 percent; the enterprise accumulations increased by 106 percent; the share of workers and staff members increased by 104 percent, with the average individual share increased from 14 yuan to 28.55 yuan (including the pay for overtime and working on Sundays).

3. The expansion of sales was welcomed by the customers. In the experiment of the system of management responsibility among commercial departments, the volume of sales has become the main index with a direct bearing on the economic benefits for the state, the enterprises and the workers and staff members. For this reason, the workers and staff members generally try every possible way to overfulfill the sales targets by opening early, closing late, setting up a network of vendor stalls, dispatching itinerant sales teams, and adopting various methods to suit the convenience of customers as a means of boosting sales. Even though retail sales through other channels were increased, the sales of the units with responsibility for business management also increased by a wide margin instead of dropping. In June, the sales volume of 15 experimental units under the Fushun Municipality Food Company amounted to 275,300 yuan, a 39.4 percent increase over the amount before the experiment in May, when a loss of 458 yuan was sustained. Thus the experiment quickly turned the loss into a profit of 16,300 yuan. The increased sales of food and nonstaple food items and sundry goods eased the strain on supply in the market and helped satisfy the wants of the consumers.

4. It helps to overcome the bureaucratic style in commerce and to improve the quality of service by changing the workers' attitude toward work. In view of the competition on the market, there is the need to improve the work style in order to win over the customers. Since adopting the system of responsibility, many units have begun to pay attention to the quality of goods, to prolong their hours of operation, to increase the varieties of their goods, to set up more vendor stalls, to dispatch more push carts for door-to-door deliveries, and to offer other services as they once did. In the past, the Talian Nonstaple Food Store and the Beancurd

Processing Factory of Fushun Municipality were unwilling to sell their goods in the early morning. Now their workers are starting out at 4 o'clock in the morning to peddle their wares along the streets and small lanes. Nearly all experimental units have prolonged their operation hours, and the masses are praising them as "bureaucratic stores" turned "convenience stores." The attitude of commercial workers toward the customers has also been greatly improved. Cold receptions from these workers have diminished, while wranglings followed by the exchange of blows are now practically nonexistent.

Practice of the system of management responsibility has given rise to many new problems concerning cadres, labor, wages, fringe benefits, planning, finance and even the commercial system as a whole. In the case of Liaoning, the following problems in particular should be noted and carefully handled:

1. Political and ideological work must be stepped up in the practice of the management responsibility system. This system however should not be regarded as a solution to all problems, and it is necessary to guard against the tendency toward "obsession with money," and the "one-track mind" with "profit as the primary concern." Besides endeavoring to attend to the interests of the state, the collective and the individuals, we should also encourage all the cadres and workers to cultivate the overall and mass concepts, to oppose the capitalist business style of being concerned only with profits, to overcome departmentalism and individualism, and to refrain from violating state policies to the detriment of mass interests. In active collaboration with the financial departments, they should safeguard state taxes and profits and also protect the interests of the customers. An important new problem is about the way to protect the customers' interests with regard to the quantity, quality and prices of goods, the sanitary conditions, and the quality of services. As a means of circulation, commerce has a direct link with millions upon millions of people. Thus it must be guided by government policies and planning, and be carried out with a sense of responsibility to the people and in the consumers' interests. If it fails to meet these requirements, there cannot be any socialist commerce to speak of.

2. In practicing the responsibility system, different forms must be adopted according to different trades, different enterpirses and different conditions. There cannot be a single solution to all problems, and should not be any mass action taken on the spur of the moment. The food trade carried out both production and marketing and its business volume is so small that it generally involves no major issues. Large retail stores and specialty sotries deal with large transactions with high profits, but their work is complex and subject to restrictions from the source of material supplies. For the operation of these stores, there should be full preparations and cautious measures, while hasty action can easily lead down the wrong path. Vegetables, fruits and aquatic products are susceptible to seasonal changes. Because of their perishable nature and unstable yields, it is difficult to fully protect the consumers' interests. Therefore, continued research and summing up of experiences are necessary in determining the quotas, the ratios of profit sharing, and the measures to be adopted. If we rely on a single formula for the solution of all problems, or rush into large-scale action on the spur of the moment, we may commit grave errors and turn good into evil.

3. The relationship between the responsibility system and the various exisitng policies should be carefully handled. Adoption of the responsibility system neces-

sarily calls for the revision of many existing policies, systems and regulations. At present, the workers and staff members of enterprises under the responsibility system are demanding the abolition of central stores, the change of managers and the regrouping of work teams on a voluntary basis. Besides rejecting the plans passed down level by level for yearly production increases, they also demand greater flexibility in pricing and revision of the rules restricting the bonus awards, medical expenses, retirement benefits and so forth, which involve many important policies. In addition to approval by higher authorities for the enterprises and workers to conduct these experiemnts, there should also be a cautious approach and a timely summing up of experiences in order to determine the pros and cons of these new methods. Popularization should be carried out selectively, and if any serious mistake is detected, the enterprises and workers should be convinced of the need for prompt remedy. The total share of profits of the workers should be divided among them according to the principle of more pay for more work, and not in any crooked way. We should also be mindful of the feelings of those all around us. If the above-quota reward is too large, we should increase the public accumulation instead of dividing it all among the individuals.

4. There should be a program of rotational training for the cadres, workers and staff members. At present, there are too many cadres, workers and staff members on the one hand, and on the other hand, the management level is too low. There are also many young workers who lack even rudimentary vocational knowledge. In practicing the system of management responsibility, the basic level enterprises should first have a fairly good leading body, and the political and vocation levels of their workers and staff members should be raised a great deal. Therefore, it is necessary energetically to launch a program of rotational training for cadres, workers and staff members. There should be coordinated training programs inside and outside the enterprise, with greater stress on the former. Every effort should be made to provide facilities for more training classes of 3 or 5 months' duration to be held for cadres, workers, new workers and the professional personnel. Particular attention should be paid to the training of cadres and the consolidation of their ranks. The enterprises experimenting with the system of management responsibility should have fairly strong leading bodies. If they are soft, lazy and lax, it will be hard to make this important reform a success.

GUANGZHOU HOLDS ADVERTISING FORUM

Guangzhou GUANGZHOU RIBAO in Chinese 7 Oct 81 p 1

[Article by Lu Yongjiang [7120 3057 3068]: "Industrial Enterprises Should Count Advertising Expenses as a Part of Production Cost"]

[Text] "Industrial enterprises should count advertising expenses as a part of production costs." This demand was made yesterday evening by a leading comrade of the municipal economic commission at the Guangzhou Municipal Economic Advertising Work Forum in discussing the deployments for developing advertising in the economy.

The Guangzhou Municipal Economic Advertising Work Forum was jointly convened by the Guangzhou Municipal Economic Commission, the Guangzhou Municipal Advertising Company, Guangdong People's Radio Station, Guangdong Television Station, NANFANG RIBAO, YANGCHENG WANBAO and GUANGZHOU RIBAO. Participating were over 400 pertinent personnel from various industrial bureaus, districts and counties as well as industrial companies and enterprises. At the forum, the advertising company and the advertising departments of the various news organizations gave introductions on the nature and role of advertising publicity, the municipal pharmaceutical industry bureau presented its results in developing economically-oriented advertising, and the municipal economic commission made arrangements for future economically-oriented advertising work.

The forum opined that market competition is becoming ever keener. Some commodities formerly in short supply have begun to be available in unlimited quantities, even leading progressively to excess inventories. Relying in the past on sales personnel to market commodities was too narrow in scope, took too long and had an inadequate payoff. It also ran up costs. Therefore, industrial enterprises should make thorough use of various channels and multiple media such as the newspapers, radio broadcasts and television as well as street signs, display windows, neon lights, slide shows, lanterns, motorized vehicles and streetcars to develop advertising publicity for industrial products and strengthen the competitive power of their products. This would help promote production, provide direction to consumption and forge links between production and sales.

At the forum it was pointed out that not all of the leaders at various levels have the same level of understanding of the development of advertising publicity by industrial enterprises. For example, some feel that there is no need to advertise products which are selling well and that advertising is only for products whose sales are lagging. Others feel that advertising costs are too large and are not rational economically. For these and other reasons, economically-oriented advertising is well behind the level of market competition. According to incomplete statistics, last year the advertising expenditures of Guangzhou's industrial enterprises was not even 0.01 percent of the municipality's total industrial output value. Last year only 35 percent of its Guangzhou customers continued advertising with the advertising company. Many enterprises have not entered advertising into their daily agenda. Over the past several years, an increasing number of advertising customers have come to Guangzhou from outside and commodities from elsewhere have made progressive inroads into the Guangzhou market. This situation must be of great concern to the leaders of our municipality's enterprises.

At the forum, the municipal pharmaceutical industry bureau, which has long paid serious attention to product advertising, reported that the 18 enterprises in its system spent 1 million yuan on advertising last year and plans to spend 1.6 million yuan this year, about 0.58 percent of total output value. The advertising outlay is not large, but the economic results are marked. For example, after advertising publicity was stepped up on Qianbai [Thousand Cypress] rhinitis tablets, a new product of the No 5 Chinese medicine plant, over 6,000 letters and orders came in from outside requesting to buy the medicine. Jiere zhitong san [6043 3583 2972 4027 2414: fever and pain relief powder], an old product of the Hejigong pharmaceuticals plant, has been in great demand nationwide since it was advertised.

A leading comrade of the municipal economic commission set forth the following demands at the forum for future development of economically-oriented advertising by our industrial enterprises: One, we must thoroughly utilize advertising publicity measures, advertise ordinary products and advertise famous-name products which have been awarded gold or silver seals as well. Two, operational departments at all levels must set up specific organs or full-time cadres to be responsible for product advertising publicity planning. Three, advertising expenditures are to be entered into production outlay plans. Four, advertising methods still need to be improved. We should strive to work together with the sports departments and literature and art groups to do this work well. Five, advertising should seek truth from facts and oppose misrepresentation or falsehood.

BRIEFS

XINJIANG PERSONNEL BUREAU MEETING--The Xinjiang Regional Personnel Bureau recently held a meeting to solve the problem of cadres and their spouses having to live in two separate places. Personnel bureaus at all levels in the province have tried hard to solve the problem of cadres and their spouses having to live in two separate places since the 3d plenary session of the 11th CCP Central Committee. Over the past 2 years, the region has helped some 2,150 couples to live together again. This meeting summed up the region's achievements in helping couples to live together again and made arrangements for future work in the new situation. In conclusion, the meeting demanded that responsible comrades at all levels seriously grasp this task. [HK101346 Urumqi Xinjiang Regional Service in Mandarin 1300 GMT 5 Nov 81 HK]

SHAANXI MODEL WORKERS RALLY--The Shaanxi provincial people's government recently issued a circular on the decision to hold a rally in March 1982 to commend advanced enterprises and model workers. This rally will commend advanced enterprises which are owned by the whole people or by collectives and model workers on the fronts of industry, communications, capital construction, agriculture, forestry, finance, trade, scientific research, culture, education, public health and tourism. The provincial people's government will confer the title of "Shaanxi provincial advanced enterprise" on the advanced enterprises and award citations to them. The provincial people's government will confer the title of "Shaanxi provincial model workers" on the model workers and award honorary certificates and badges to them. [HK140710 Xian Shaanxi Provincial Service in Mandarin 1130 GMT 10 Nov 81 HK]

BEIJING CIRCULAR BANNING MALPRACTICES--The Beijing Municipal People's Government recently issued a circular strictly prohibiting construction enterprises from privately and indiscriminately employing peasants from other places and from carrying out unlawful activities. Recently, contrary to the state regulations, some construction enterprises in this municipality privately and indiscriminately employed peasants from other places to do construction work, sought profits by subcontracting projects to others and reaped staggering profits by speculation, profiteering and other illegal methods like signing contracts on behalf of others. Some people offered and received bribes. Investigation revealed that the number of peasants various enterprises have illegally and privately employed from other places is more than 40,000. The circular reiterated that construction teams from other places must obtain the approval of the State Capital Construction Commission or the Beijing Municipal Construction Committee before they do construction work in the municipality. No unit is allowed to privately employ peasants or construction units from other places. All construction teams which have come to Beijing with approval must leave the municipality after they have completed the projects. The peasants and construction teams which have come from other places without approval must quickly leave the municipality after the phase of the project on which they are employed has been completed. They are not allowed to begin a new project. [HK101333 Beijing City Service in Mandarin 2300 GMT 1 Nov 81 HK]

HENAN FINANCE CONFERENCE--The Henan Provincial Finance Committee recently held a conference of the chairmen of all prefectual and municipal finance committees. The conference seriously looked into and analyzed the new situation and new problems of this province's financial and trade work. The conference also formulated the feasible measures to do financial and trade work well. Li Qingwei, provincial CCP committee secretary and vice governor; and Wang Bingzhang, provincial CCP committee Standing Committee member, attended and spoke. In his speech, Li Qingwei emphatically pointed out that it is necessary to arrange the markets well and do well in procuring agricultural produce, grain, cotton, oil, hemp, pigs and other native products and in market supplies of industrial products and consumer goods, such as bicycles, sewing machines, watches, cigarettes and beer. It is also necessary to protect local industrial products. [HK030410 Zhengzhou Henan Provincial Service in Mandarin 1130 GMT 15 Oct 81 HK]

ECONOMIST ON NEW ROAD IN ECONOMIC DEVELOPMENT

OW051217 Beijing XINHUA in English 1201 GMT 5 Dec 81

[Text] Beijing, 5 Dec (XINHUA)--"China is blazing a new road in developing its national economy," a noted northeast China economist said to XINHUA here today.

Professor Sung Zexing, vice-president of Liaoning University in Liaoning Province who has studied and taught economics for over thirty years, is now attending the National People's Congress in Beijing as a deputy.

"The new road, as mentioned by Premier Zhao Ziyang in his report to the congress, will give steady speed and good benefits to economic development, and more welfare to the people," the economist said. "China has been looking for such a new road over the years."

"After nationwide liberation in 1949," the professor recalled, "China followed Soviet Union's pattern in developing its economy, and later was influenced by a left deviationist line. It took a road of great speed and high targets, not tallying with the actual conditions of the country, which had a big population and a weak and backward economy. Heavy industry was given first priority at the expense of agriculture and light industry, causing imbalance in major proportions of the economy as a whole. Production cost was high and efficiency low. People's needs and welfare were overlooked."

"Since 1978," the 64-year-old professor said, striking a match to light a cigarette, "we have learned from past lessons, summed up experience, and repudiated the old road.

"The new road conforms with China's actual circumstances and objective economic laws. Its essence is raising economic benefits as mentioned in the premier's government work report. This means achieving the best possible economic effectiveness at the least possible cost in production, construction, circulation and all other spheres of economic endeavour. This is the way to truly benefit the people."

"As for heavy industry," he said, "efforts should be made to gear it to producing for agriculture and light industries. The weak links in economy, namely energy, communications and transportation, should be reinforced."

ECONOMIC RATIONALITY MUST ACCOMPANY TECHNICAL ADVANCEMENT

Tianjin KEXUEXUE in Chinese No 2, 20 Aug 81 pp 11-14

[Article by Lu Taihong [4151 1132 1347]: "Technical Advancement and Economic Rationalization"]

[Text] The three elements of economic growth are: an increase in labor, an increase in capital and adoption of new technology. Adoption of new technology occupies a more and more important position among these three elements with the rapid development of science and technology. Take Japan, for example. The contribution to its economic growth from the end of the war to 1960 was approximately 52 percent due to the labor force, 43 percent due to technological development and only 5 percent due to increase in capital. The period 1965-1970 was a period in which Japan's economy showed a very rapid growth rate--an average annual rate of 11.6 percent, of which 4.4 percent was achieved with an aid of science and technology. According to many forecasts, 65 percent of Japan's economic growth during the 1980's will be due to the power of science and technology. According to a study made by an American economist, E. F. Denison [phonetic], adoption of advanced technology constitutes 44 percent of the weight of various factors contributing toward increased production. In fact, 40 to 60 percent, or even 80 percent, of the economic growth achieved by a few advanced nations is due to the adoption of new technology. Therefore, a large amount of advanced technology must be employed in order to develop the economy. However, can every concrete technological advance bring about economic benefit? The answer appears to be affirmative, but in fact, it is not. Here are a number of examples attesting to this effect:

The solar energy hot water heater, distributed by Beijing service enterprises, which has been praised as "a new blossom of science and technology" and widely propagandized by the newspapers and radio stations, was awarded a national science conference award. A total of 41 units of this solar energy hot water heater were built, as a result of which 700-800 tons of coal could be saved a year and air pollution could be eliminated at the same time. However, since the cost of operating the solar energy hot water heater comes to almost twice the cost of heating water with a conventional boiler, many units which are in possession of such equipment often opt not to use it. A certain unit spent over 10 million foreign exchange units in order to import an advanced computer. But because of its low rate of utilization, a few hours each day at most, the economic profit it earns is not even enough to make up its depreciation cost. Various types of advanced numerically controlled lathes and work centers developed and manufactured in China during the 1970's have not been popular among the users in spite of their high degree of automation and superior capability. On the other hand, a type of numerically controlled linear cutting lathe which is far simpler in design (so it is not counted as part of the numerically controlled lathes nationwide) has become so popular that the supply could not meet the demand for a time.

Many similar phenomena have been observed during the process of our technological development. Which prompts one ot ask: Why? Where is the grave illness of the problem? This article will not attempt to provide an overall answer to these questions. It merely intends to start out from a number of important facts related to technological development and economic growth and to analyze and discuss one side of the problem--technical advancement and economical rationalization--with the hope of contributing in a very small way toward establishment of a technological policy.

1. Three Foundations for the Establishment of Technological Policies

If the body of science and technology is compared to a tree, then science is the root and trunk, while technology is the branches and fruits. Technology depends on science for survival, while science is materialized through technology. The measure for science is truthfulness while the measure for technology consists of advancement, economy and safety. Since the end of World War II, science and technology have grown into a giant tree with an abundance of branches and leaves reaching into the blue sky. Therefore, it has become more and more difficult to give an overall evaluation of the entire body of science and technology or to make an accurate prediction about it. As a result, technology policies which define the direction and guide the development of technology were necessary. The facts concerning the world's technological development indicated that a correct technology policy could bring about an enormous strategic profit to a nation, while unaccountable losses were also brought about as a result of wrong technology policies. For example, the Soviet Union made a mistake on technology policy related to the raw material used in the electronics industry. While the semiconductor industries of the technologically advanced nations were quickly converting from germanium to silicon as the main raw material for semiconductors, the Soviet Union preferred germanium and continued to pursue germanium technology. Later on, when it too decided to make the conversion, it had already lost a considerable amount of time, manpower and material power, and a state of backwardness in the electronics industry resulted. In the field of chemical industry, the Soviet Union failed to recognize the importance of the petrochemical industry, so not enough effort was made. As a result, the Soviet Union was still dependent on imported technology in the 1970's. China, during the 1950's and 1960's, failed to assess the true strategic significance of the electronics industry, so, in addition to the "congenital disorder," "malnutrition" at a later time created a severely backward state of electronics industry in China today. However, in the field of oil resources, a new view presented by Comrade Li Siguang concerning the existence of an oil-bearing basin in the depression belt of the New Huaxia system in China's northeast area provided a basis for policy-making by the central government and thus steered China away from entering the very expensive road of synthetic fuels. The United States is the country in which research into machine translation was done the earliest. It is in possession of enormous power for carrying out research. However, after a white paper was published in 1966 pointing out the mistaken trend of machine translation, the development of machine translation has declined. In recent years, more and more nations have begun to attach greater importance to technological policies and their development. In the United States, a law was enacted in 1972 establishing a mechanism so that all important technological policies (such as energy resources) will be decided by the president personally. There are many technology policy problems which are related to the realization of the four modernizations in China today. A leading comrade of the Academy of Sciences says: "Research into technology policy is an important undertaking having strategic significance not only for China's science and technology but also for the economy."

What should be the bases for doing research and drafting in order to produce technology policies which are as correct as possible? The following results have been obtained from an analysis of a large volume of facts throughout the history of development of science and technology: technological evaluation, economic evaluation and damage evaluation are the three indispensable bases for drafting correct technology policies. The technological evaluation weighs the advancement of technology; economic evaluation weighs the economic advnatages and disadvantages of the technology; and the damage evaluation weighs the damages that the technology may bring about. Without evaluating the advancement of technology, technological development may produce a large number of repetitions and waste, or introduce obsolete equipment, or engage in research into technologies which have long been solved. There are numerous examples of unnecessary losses incurred as a result of lack of information and neglect in evaluating the advancement of technology. Yang Zhenning once estimated that "at least 40 percent of China's research topics are subjects which have already been solved abroad." Without evaluating the economic rationality, the various probable courses the technology may follow cannot be compared and the best course chosen among them; nor is it possible to find out whether the advanced technology can enter into a practical application stage, or become popularized and widespread; nor is it possible to expose any latent weaknesses that the technology may possess. Is an advanced technology adoptable? We must find the answer in how economically rational the technology is. This is a commonly known principle understood by everybody in the course of our own daily lives. The reasons why nylon stockings so quickly replaced silk stockings is not only because nylon stockings have appeal and durability (advancement), but also because nylon stockings are economically profitable. Although the airplane is one of the means of transportation with a highly advanced technology, many people still prefer to ride on trains or steamships. One of the reasons is that the air fare is too expensive (economically irrational). A pity! Such a simple yet important principle has never been sufficiently applied to our technology management in the past. Scientific research project proposals are often found without an estimation and comparison of economic cost and a prediction of the technological and economic effects. In screening the project proposals, little attention has been paid to the economic rationality of the project. In evaluating the achievement or popularization of a new technology, we lack the figures of competitive economic indexes as a guide for passing judgment. A few years ago, there was even a mistaken notion or slogan which ignored the economic evaluation completely. For example: "It does not matter how much money is spent as long as it can be developed." Or, some projects which have been completed domestically are used "to fill the gap in this province (or this district, etc)." Using this kind of standard in screening and awarding, many projects which were neither advanced technologically nor rational economically were simply copied. Without evaluating the damage that a technology may bring about, no preventive measures and warnings against the side effects of a technology can be issued, so in the end, the loss may become greater than the gain. As a result of severe air pollution created by the industrialization in and around London, England, in the early 1950's, a tragedy of 4,000 deaths within 4 days was recorded. The accident which took place at the Three Mile Island nuclear power plant in the United States in 1979 sent ripples all over the world, causing those nations with nuclear power plants to reevaluate their technology policies. A great number of small automobiles solved the transportation problem, but at the same time, created a shortage of energy resources and air pollution. Advanced automation technology can significantly increase labor productivity, but is also capable of creating employment problems in a country like China with a large population. An irrational way of creating rice paddies from lakes, hydraulic engineering projects without a bioenvironmental concept, and excessive fishing and water pollution can all contribute to a significantly reduced yield of fresh water fish.

Moreover, we can also understand how inseparable these three foundations--evaluations of technological advancement, economic rationality and possible damage--are from the study of a few special phenomena observed during the course of technological development. For example, utilization of solar energy is overwhelmingly superior to any other energy resources, and technical feasibility has long been confirmed. But why is not the technology for utilization of solar energy popular all over the world? In contrast, the microprocessor is a technology which appeared only in the early 1970's. Why was it able within the short period of only a few years to enter into commercial production and undergo four generations of changes, with production reaching 400,000-500,000 units in 1975, an annual growth rate as high as 52-55 percent (estimated over the period of 1975-1980) and spread over a very broad area with surprising speed? The United States is a country with highly advanced electronic computer technology which is in possession of the most advanced technology of the fourth-generation computers. Why then during the late 1960's and early 1970's did it develop and manufacture a large number of sequential control devices, which require much less advanced technology than the computers, and popularize them? Among the numerically controlled technologies developed by the United States in the early 1950's, the closed-loop control was an advanced technology. However, after the closed-loop control technology had matured, why did Japan begin research and development of a technologically simpler open-loop control technology? And since 1965, why did the United States itself also develop a kind of numerical control device with a lower degree of control power using the open-loop control as its main feature? In the summer of 1970, a gigantic Aswan Dam was built on the upper Nile River, increasing Egypt's farm area by 20 percent and producing 8 billion kW of electric power a year. The project was acclaimed as a "great technological" victory at the time. Buy why, only 2 years later, was the project judged by the United Nations environmental conference as "a failure in hindsight"?

During the process of drafting technology policy, the weight assigned to the three--technological evaluation, economic evaluation, and damage evaluation--may vary according to the objectives and emphases. In certain circumstances, one of these three may have to be dominant. For example, military requirement emphasizes advancement of technology. However, the present trend tends to emphasize evaluation of advancement of technology and neglect evaluation of economic rationalization and damage. The science and technology management neglects economic evaluation, while the economic management neglects technological evaluation. As one of the leading comrades of the State Science Commission observed: "Generally speaking, the comrades who are engaged in economic work lack understanding of science and technology matters and so are unable to think deeply about technological advancement and possibilities." We shall put aside the damage evaluation for a while and concentrate on an analysis of the interrelationship between technological evaluation and economic evaluation.

2. Four types of Technology and Four Stages of Technological Development

In order to take into consideration both technology and economy, the foreign management field has developed the concepts of "performance-cost ratio" and "performance-cost curve." These useful concepts are employed to express the different economic prices required by the different technologies to achieve the same performance. Starting out with this concept, various types of technologies may be grouped into four groups. When we select technology from an ocean of technologies, we can choose from one of these four groups.

First group: Backward technology and high economic price.

Second group: Relatively backward technology with some economic profit. For example, coal as an energy source used in some old equipment and old technology engaged in production.

Third group: Advanced technology with high economic cost and high price. For example, solar energy utilization equipment developed in the 1970's; the magnetically suspended high-speed train; and the direct steel smelting method.

Fourth group: Advanced technology and low economic cost. Typical examples include the microprocessors and the minicomputers which appeared in the early 1970's. A minicomputer priced at $300 is more advanced in technology than the first large-scale computer (ENIAC) built in the world. It is 20 times faster, several thousand times more reliable, 30,000 times smaller in size, and a millionth the price. A history of computer development spanning more than 30 years indicates that approximately every 5-8 years the computer speed is raised 10 times, the size is reduced 10 times, and the cost is also reduced 10 times. The cost of the storage device, among all the computer components, has been reduced most significantly. The performance-cost ratio of the dynamic storage onboard the computer dropped from 1 penny/bit in 1972 to 0.04 penny/bit in 1979.

Therefore, technological advancement and economic rationality do not always go hand in hand. The most advanced technology is not necessarily also economically rational. An advanced technology without economic rationality cannot endure. At a certain time and in a certain domain, it will be replaced by a relatively less advanced technology which is economically more rational. For example, Sweden is a country in which the electronic communications technology is relatively advanced. During the 1970's, it already grasped the advanced technology of an all-electronic automatic exchange. However, it did not mass-produce this device and utilize it immediately because it learned from the performance-cost curve that, compared with the existing old equipment, the new equipment could become economically rational only in the 1980's.

Furthermore, every single new technology has its life cycle, as is evident from a study of the process of technological development itself. Each life cycle has four stages, including the inception stage, the growth stage, the mature stage and the decline stage. Technology in the inception stage has an uncertain future. An advanced technology with important economic profit can emerge if a breakthrough can be made and if it can ride out the technological and economic storms (risks). For example, controlled thermonuclear reaction, magnetohydrodynamic power generation, generic engineering, and intelligence modeling of the 1970's. Technology in the growth stage has life power and is also in possession of a potential economic competitive power. For example, applications of optic fiber communications technology and the microprocessors of the 1970's. According to a Japanese analysis, if the profit growth rate of a technology at this stage is above a horizontal line, then a steady economic profit over a period of time can be obtained. Technology in the mature stage is an established technology, and it may have already been commercialized. Therefore, it is a waste of money to repeat research work on this type of technology. It is more profitable economically to import the technology and try to expand it horizontally according to a certain specific need. For example, civilian applications of military technology; household applications of electronics technology; and importation of a television production line by China. Both the technological advancement and the economic profit can be further increased if a new technology can be created on the foundation of the imported technology (such as the steel making technology of Japan and the computer software technology of Rumania). Technology in the decline stage is an obsolete technology which belongs to the first group described above.

3. Horizontal Expansion and Vertical Penetration of Technology

In carrying out the technological evaluation, the first group and the fourth group described above are relatively easier to deal with, because the technological advancement and the economic rationality are in agreement in these two groups. The second group and the third group are more difficult to evaluate, because the technological advancement contradicts the economic rationality in these two groups. The purpose of applications research and development research is, for the most part, an effort to transform this pair of contradictions. If the factors causing the failure of an advanced technology to be adopted are called the risk factors, then there are two kinds of risk factors. The first kind is technological risk: failure is brought about by insufficiently verified technology, insufficient technological power, and insufficient ability to assimilate the technology. The second kind is economic risk: failure is brought about by irrational economics. The tasks of technology policy in such circumstances are to select a technological objective and chart the course to achieve this objective in spite of the risks. In selecting the technological objective, one concept which has become popular in recent years involves adoption of "intermediate technology" or "appropriate technology." According to this concept, a relatively advanced technology, situated between the most advanced technology and the existing traditional technology, which is most appropriate for the existing circumstances should be selected, because this technology is more mature and will be able to bring about large economic advantage.

Large numbers of facts accumulated over the history of development of technology and economy have proven that horizontal expansion and vertical penetration of technology are the means employed to reconcile the disagreement between technological advancement and economic rationality. Horizontal expansion of technology means application of the same technological invention in different areas. Horizontal expansion of large-scale integrated circuit technology has produced electronic watches, intelligent machines, intelligent robots, household electronic brains and minicomputers. Laser technology has seen a similar expansion. A very large economic advantage can be brought about when new products are manufactured from the combination of a number of technologies in the mature stage. The Japanese call this "combination technology," and they consider that this is one of the trends of technological development today. China should especially emphasize this trend in its economic management today and exert efforts to develop new products by extending the useful economic life of the existing mature technology. Vertical penetration of technology means to dig deeper into the technology and to make it more advanced. Economic irrationality can be transformed into rationality through technological breakthroughs. Electronic computers used to be very expensive, but the price came down as a result of the breakthrough of the large-scale integrated circuit. A huge economic advantage has been brought about by the appearance of the large-scale technology since the 1950's, and large-scaling has become a trend as well. For example, the manufacturing cost per unit of power output of a 6 million kW generator unit is 10-20 percent lower than that of a 200,000 kW unit. A synthetic ammonia facility with an annual capacity of 200,000 tons consumes energy amounting to 1,450 kWh per ton, while a synthetic ammonia facility with an annual capacity of 460,000 tons consumes only 50 kWh per ton. A number of breakthroughs made in the petrochemical industry (consisting mainly of direct synthesis technology and new types of catalysts) have likewise made the economic index change toward greater rationality. For example, a method of manufacturing acetaldehyde from ethylene by means of direct oxidation has brought down the cost by 16 percent, increased the profit by 65 percent, and reduced the equipment cost by 25 percent. The production of hexanolactam using the toluene method has brought down the cost by 25 percent, increased the profit by 100 percent and reduced the equipment cost by 33 percent.

Another approach to transforming the contradiction between technology and economy is to import technology. As long as the policy for technology import is correct, we cannot only gain time and advancement but also obtain economic profit and rationality. Take Japan, for example. Japan spent $6 billion on the importation and popularization of foreign technologies over the period 1945-1970. As a result, a project could be concluded in 2-3 years based on the imported technologies. On the other hand, the research expenditure of the original technologies was as high as $180-200 billion with a time period of 12-15 years for a project to be concluded. Therefore, the cost for importation of technology is only 1/30 of the original cost and the time is also 4/5 shorter. To further illustrate this point using specific products as an example: Japan's Toyo Rayon Company spent $7 million to buy a license for the production of nylon, and earned from the export of nylon $90 million within 2 years. The profit amounted to approximately 13 times the cost of licensing the patent. On the other hand, the Du Pont Company spent more than $250 million and 11 years in order to develop this patented technology.

It is evident from the above that technological advancement and economic rationality do not always go hand in hand. Whether a certain technology policy is correct, or whether a certain manager is really able is measured by whether the policy or the manager is capable of grasping the optimum point at which to carry out this transformation of contradiction, to achieve the maximum economic effect by adopting the advanced technology at the optimum time.

4. A Few Suggestions

A. Technological policy should favor the development of technologies belonging to the fourth group (advanced technology with economic rationality). Application screening and evaluation of scientific research projects must include economic indexes, and a prediction of the economic rationality and the probable damage must be made.

B. Technological policy should protect and financially support those technologies which are technologically advanced and economically competitive. These technologies, which are in the growth stage, will hopefully bring about relatively large economic effect. The economic measures and price policies which in practice protect the backward technologies should be abanoned as soon as possible.

C. In selecting scientific research projects, special attention must be paid to those key technologies which can create obstacles to economic rationality. For example, the key technology in the utilization of solar energy is the search for better materials with higher conversion efficiency and not different types of converters.

D. The fund controlled by the Economic Commission for developmental research and the fund controlled by the Science Commission for scientific research must be clearly differentiated according to the subjects for funding. The Economic Commission fund should be spent mainly on the horizontal expansion of technology in accordance with market demand in order to achieve the maximum economic profit in a short period of time. Therefore, its subjects should consist mainly of technologies in the mature stage. The fund of the Science Commission should be spent mainly on the vertical penetration of technology in order to achieve breakthroughs. Therefore, its subjects should consist mainly of technologies belonging to the third group, or technologies in the growth stage.

E. The economic department should strengthen the upgrading and renewal of products. As a result of rapid progress in modern science and technology, the period from the appearance of a new technology to a product being produced industrially is becoming shorter, so is the period for upgrading and renewal of new products, and also the period for an equipment or a technology becoming obsolete. For example, the life of a new product in the United States, West Germany and Japan is in general 6-8 years, and no more than 2-3 years for certain most advanced technologies (such as the onboard storage device). The life of new materials is approximately 10 years. The life of new technologies is approximately 7 years, and the life of new instruments is approximately 5 years. About one-fourth of the 3,500 products of the 3M Company of the United States were unheard of 5 years ago. In contrast, some products in China have been "continuously in production for several decades." Large economic profit cannot be achieved from the use of technologies which are in the decline stage.

NATIONAL POLICY AND ISSUES

'GUANGMING RIBAO' STRESSES SPEED, ECONOMIC RESULTS

HK071047 Beijing GUANGMING RIBAO in Chinese 28 Nov 81 p 3

[Article by Li Yu [2621 1878]: "Speed and Results"]

[Text] The matter of speed and results has all along been a major problem that must be given attention and properly solved in our economic construction. The speed of economic growth is an important condition for the socialist system to ultimately triumph over the capitalist system and for backward countries to catch up with and surpass industrially developed countries. In achieving the four modernizations, it will not do if the speed of economic development is incompatible with national conditions and national resources. Even during the period of the readjustment of the national economy, we must maintain a given speed of growth. Improved economic results remain the starting point and the final aim of all economic work. Satisfactory of unsatisfactory results are the ultimate mark and measure of all economic work.

Then, what is the central problem in our current economic development? In light of both positive and negative experiences in economic construction summed up in the past 30 or more years, I believe that the central problem in our economic development remains the improvement of economic results. The aim is to enable the national economy to maintain a given speed of growth through improved economic results. We must resolutely rectify the mistake of ignoring economic results. Meanwhile, we must guard against and oppose any tendency toward disregarding the speed of growth. Through an "input" of our existing manpower and financial and material resources, we seek the kind of "output" allowing still better national economic results and a maintained speed of growth.

In the current process of the readjustment of the national economy, what is the main way of improving economic results and maintaining a given speed of growth? We cannot seek capital construction and the development of heavy industry by relying on the method of increasing the financial deficit. Nor can we effect major reforms in economic management without being equipped with the necessary conditions. To solve the problems that have accumulated in the unbalanced development of various economic sectors over the past several decades takes a given period of time and involves a process. The only way out for us is to do things according to objective economic laws and carry out construction in line with the principle of "acting according to our capability and seeking gradual progress," as pointed out by Comrade Chen Yun. Given our existing limited manpower and financial and material resources and a meager amount of money invested in capital construction every year, the main way out for us is not to seek a greater "input" but to lay the emphasis on how to get a greater "output" from the existing "input." Expanded reproduction by extension, which is indispensable, must be promoted. But we should chiefly promote expanded reproduction by intension. This is to say that we must make the fullest use of existing basic conditions and follow the road calling for a rational economic structure and the rational organization of social production to improve the economic results of the whole society and seek speed through results.

Only such economic results can promote the results of the development of the national economy. And only such a speed of growth can be a realistic and feasible speed --a speed compatible with out national conditions and national resources.

To correctly handle the relations between speed and results, achieve a benevolent cycle in the national economy and accelerate the process of modernization, we should at present lay particular emphasis on the following four basic viewpoints:

1. We Are Advocates of the Viewpoint of Dialectical Unity Between Speed and Results

Speed and results are not unrelated and mutually exclusive. Instead, they form a unity of opposites. The speed we seek is speed with good economic results. The economic results we seek are economic results at a given speed of growth. A speed of growth really compatible with national conditions and national resources can bring good economic results for the national economy. With the achievement of good economic results, there will inevitably be a given speed of growth. Any view or approach seeking to separate results from speed and set the two in opposition is wrong. If we just pay attention to economic results regardless of the speed of growth, such economic results are not really good economic results. Conversely, if we just pay attention to speed regardless of economic results, we are liable to repeat previous mistakes and invite trouble for the sake of appearances.

2. We Are Also Advocates of the Idea of Priority in Regard to the Relations Between Speed and Results

Generally speaking, speed and results are synonymous. But in actual practice, there often appear contradictions in their demands. Sometimes, the speed of growth is very high but economic results are very poor. Under these circumstances, there arisesthe problem of which is subordinate to which. Should the demand for speed be subordinate to the demand for results, or the demand for results be subordinate to the demand for speed? Experience shows that we should subordinate the demand for speed to the demand for results. Only in this way can we achieve speed. And only in this way can there be a scientific basis for speed, can speed be feasible and marked with actual results.

On the other hand, if where there are contradictions between the demand for speed and the demand for results, we subordinate the demand for improved economic results to the demand for increased speed, then such a speed can only be one divorced from reality, false and devoid of actual results. If high speed is accompanied by poor economic results, this means that we have expanded our labor and obtained an increase in output but much of our labor has been wasted. This is because the products throughout are useless and fall short of the needs of society and the people. This is like the situation that appeared before. To maintain speed and pursue output value, everyone ended up with a speed for growth that worked out many times higher. But the quality of products was often neglected. The variety of products was reduced. The consumption of various materials increased. The costs of products went up and profits dropped. Economic results as a whole were relatively poor. Therefore, we must not reverse what should be given priority in regard to the relations between speed and results.

3. We Must Achieve Speed Through Results

How should we seek and from where should we start, in order to better conform with actual conditions and better realize a virtuous cycle in the development of the national economy? There are two approaches with two different kinds of results involved here.

One approach is to seek speed through speed. With higher speed as the center and the goal, pressure is brought to bear at all levels to fulfill the quotas for output value. In this way, there often appears the situation in which everyone concerns themselves only with an increase in output value without taking the trouble to study how to improve economic results, or without ever giving a thought to the problem of improving economic results. For this very reason, we cannot achieve good economic results. If good economic results are not achieved, the speed of growth demanded cannot be achieved as a result either.

Another approach is to seek speed through results. With improved economic results as the starting point of all economic work, we seek speed starting with an improvement in economic results. Of all the indicators of economic results, the most important index is the quantity of products provided for national construction and for the people in their everyday life--products which are of the right kind, which are of high quality, which call for the consumption of not much material, which are low in cost, which allow a big margin of profit, which are delivered in time and which are cheap and good. Output value and other indicators only serve as a supplementary pointer. Economic results with the end products used as a main indicator can surely bring about an appropriate increase in the speed of growth. Only such a speed is compatible with reality and is realistic and reliable.

In sum, economic results unaccompanied by an increase in speed are not real results. The ultimate indicator or measure of whether or not the speed of growth is rational can only be satisfactory or unsatisfactory economic results.

4. There Is Great Potential in Improving Results and Maintaining the Speed of Growth

From January to September this year, the output value of light industry showed an increase of 12.4 percent. But due to a drop in the output value of heavy industry, the total industrial output value had risen by only 1.5 percent compared with the corresponding period last year. Economic results were not ideal either. We must strive to achieve still better economic results in the development of the national economy next year, achieve a relatively satisfactory speed, such as can be obtained after effort, and advance at a more steady and brisk pace. To do so, we should further tap the potential in increasing production. We must pay particular attention to tapping the potential in the growth of heavy industry. This is because the output value of heavy industry is relatively large and has a relatively great effect on the speed of growth of industrial production and economic results.

In tapping the potential in heavy industry to increase production, the emphasis should be put on readjusting its service orientation, enlarging its scope of service, strengthening its adaptability and overcoming the contradictions between those sectors which are operating below capacity and those which are overburdened with work. Take the machine-building industry for example. It must complete the switchover from serving itself to serving agriculture, light industry, the people's livelihood, export business and technological reform. As quickly as possible. It must also direct efforts toward the development of the scope of its field, the development of techniques, the development of products, the development of services and the expansion of the market. In particular, it must provide the right machinery and equipment for the benefit of existing enterprises in regard to technological restructuring and renewal of equipment. In this way, the output value of our machine-building industry can rise and the speed and the results can also be raised. Besides, there is much room for development for the machine-building industry in such fields as environmental protection, the production of unique handicrafts and special native products, packing, serving the assembly of parts, providing repair services, foreign trade, and so forth, and in satisfying urban and rural residents' demand for mechanical and electrical products for everyday use, for consumer durables, and so forth.

The same is true of the light and textile industries. As the sources of materials for our light and textile industries and the market and production capacity expand, the economic results of our light and textile industries can also be further improved and the speed of growth also can be further accelerated. Due to a bumper harvest of cotton and silk worm cocoons achieved throughout the country last year, production of cotton, wool, silk, hemp, and so forth, is expected to increase this year. With a series of newly built large and medium-sized chemical fiber factories being put into operation, there will also be an increase in the output of chemical fibers. The shortage of raw and other materials for light and textile industries will be further relieved. Due to an increase in the income of urban and rural residents and especially an increase in the purchasing power of the masses of peasants, there is a greater demand for a greater variety of clothing, bedcovers, garments and various daily necessities. There is thus a broader market for the light and textile industries. Because various areas have turned some heavy industrial enterprises without production tasks to the light and textile industries, there will be a further increase in the latter's production capacity.

At present, to properly consolidate enterprises and raise their existing management level is an important part of the effort to improve results and maintain the speed of growth of both heavy and light industry. We can surely succeed in this respect, so long as we strengthen fundamental work and management and consolidate financial discipline and labor discipline.

NPC DEPUTIES DISCUSS ZHAO'S ECONOMIC PRINCIPLES

OW060909 Beijing XINHUA Domestic Service in Chinese 1631 GMT 5 Dec 81

[Text] Beijing, 5 Dec (XINHUA)--In group discussions over the past few days, deputies to the fourth session of the Fifth NPC have deliberated the 10 principles for economic construction presented by Premier Zhao Ziyang. It is their view that these principles contain substance, that they are effective measures suited to China's actual situation and that they reflect the aspirations of the people of the whole country.

Ma Yaoji, Beijing's deputy, said: The 10 principles presented by Premier Zhao Ziyang in his report are a solution to important theoretical and practical problems in socialist economic construction. They specify the problems in economic construction expounded in the "Resolution on Certain Questions in the History of our Party Since the Founding of the PRC." Li Tinggui and Wu Chengqing, deputies of Quizhou, maintained: Premier Zhao's report is "truthful in affirming the achievements, precise in pinpointing the problems, realistic in its planning and well-rounded in forecasting the future."

Liu Tianfu, NPC deputy and Guangdong provincial governor, and Guo Shaoyi, deputy director of the Qingdao Municipal Textile Industry Bureau, said: The 10 principles presented by Premier Zhao Ziyang are a program for China's socialist construction. Demonstrating the superiority of the socialist system, they are a basic guarantee for the accomplishment of the four modernizations. Following these 10 principles will certainly lead China's economy into an unprecedented state marked by big improvements in economic results.

Lin Zongtang, NPC ceputy and deputy director of the scientific and technological bureau of the State Machine Building Industry Commission, said: There are no proud, empty words or demogogic slogans in these 10 principles, each of which is an important, effective measure for releasing and developing the productive forces. If we work in a down-to-earth manner by following these 10 principles, China will certainly increase its "stamina" in developing the national economy. Wang Bingqin, NPC deputy and vice chairman of the investigation and research office of the Shandong Provincial CCP Committee, said: The 10 principles are guidelines for generating enthusiasm and doing concrete work. They are readily understandable and can be practiced in all trades and professions. Practicing these principles is sue to yield good results.

Some deputies who perform economic work reviewed how they had taken the beaten track for years under the guidance of the "leftist" ideas--a track that sought high speed exclusively, that laid undue emphasis on heavy industry and a high accumulation rate and that yielded very poor economic results. According to these deputies, the root cause of this situation was that subjective desire was divorced from objective realities and from the most important considerations in China--its huge population and poor foundation. The desire to make quick success resulted in waste. The deputies said: To correct the past maladies in economic work, the present 10 principles have been formualted through years of intensive investigations, studies, extensive explorations and by means of earnestly summing up experiences and lessons. This is a new road for China's socialist construction.

Song Zexing, NPC deputy and well-known professor of economics of Liaoning University, analyzed the 10 principles one by one. He said: The first, second, third and eighth principles are for solving the previous irrationalities in the economic structure, industrial structure and economic management system. The fourth and fifth principles are measures for transforming and consolidating the existing enterprises in view of their present problems. The sixth and seventh principles, which take into consideration China's inadequate funds and poor foundation, indicate ways to make good use of domestic and foreign capital in enhancing benefits. The ninth principle on raising the workers' scientific and cultural level was formulated in view of the disproportionate relationship between China's backward education and science on the one hand and the additional sectors of the national economy on the other. The last principle on the concept of doing everyting for the people reflects the objective law in China's socialist economy. Song Zexing said: In short, each of these 10 principles is well-founded. These principles respect the requirements of objective economic laws and fully bring out the superiority of China's socialist system.

Shanxi deputies said: In the past we did not clearly understand what China's conditions were, which road we should take and what it means to do things within one's power in economic construction. Now the 10 principles make things clear and give us a free hand in doing our work in the future.

In the course of deliberation, deputies from Shanghai, Shandong, Tianjin, Sichuan, Guangdong, Liaoning and Heilongjiang warmly praised Hu Yaobang, Zhao Ziyang and other party and state leaders for their leadership style of conducting investigations and studies in practical situations. They said: Some of our leading comrades in the central authorities are men of action. It is precisely because of their realistic attitude in earnestly summing up the practical experience of all localities and extensively listening to the masses' opinions that the 10 principles could be promptly formulated within a short time to ensure a realistically rapid development of China's national economy. The deputies said: The leading comrades of the central authorities have taken the lead. We must work in the same down-to-earth manner, study and publicize the 10 principles, earnestly strengthen investigations and studies, vigorously enhance our enthusiasm, meticulously and successfully perform our work in all fields and boost the national economy according to the requirements of the 10 principles.

NPC DEPUTIES ON PETROCHEMICAL, RAILWAY PROJECTS

OW061241 Beijing XINHUA in English 1227 GMT 6 Dec 81

["NPC Deputies Propose Construction of More Petro-Chemical and Railway Projects"--XINHUA headline]

[Text] Beijing, 6 Dec (XINHUA)--More petro-chemical projects should be built to make better use of China's petroleum, increase national income and provide more jobs.

This was proposed by Chief Engineer Huang Nongning from the planning bureau of the Ministry of Chemical Industry at a group meeting of the current session of the National People's Congress here.

In discussing Premier Zhao Ziyang's report, he said he agreed to the report's stress on making rational use of the 100 million tons of oil that China produces every year.

Using petroleum as fuel is a great waste, the chief engineer said. If the crude oil now being burned in China is turned into plastics, synthetic fibers and synthetic rubber, and then processed into clothing and other goods, this would bring an additional income to 39,000 million yuan a year and provide jobs for over one million people.

Since there are good prospects for developing China's offshore petroleum, the chief engineer said, work should be started right now to make preliminary feasibility studies on the construction of petro-chemical works.

Experts in the chemical, petroleum, textile and light industries should coordinate their efforts in these studies to provide a better basis for deliberation by the government, he added.

Chief Engineer Tax Baoxian of the construction bureau of the Ministry of Railways pointed out that, like energy, transport is now a major limiting factor in China's economic development.

The total length of railways now in operation in China has increased 2.4 times since 1949 and the number of locomotives, 2.5 times. However, the total volume of railway freight in 1980 exceeded 1,000 million tons, ten times that of 30 years ago. This has put great strains on the railways, he said. Tan Baoxian predicted that railway freight would at least be doubled in 20 years. Therefore, he said, new railway lines must be added while existing ones should be improved.

NPC PRAISE FOR ECONOMIC CONSTRUCTION PRINCIPLES

OW070457 Beijing XINHUA in English [no time given] 6 Dec 81

[Text] Beijing, 6 Dec (XINHUA)--At the panel discussion of the fourth session of the Fifth NPC on the report on the work of government, the deputies universally commented that the 10 principles for economic construction put forward by Premier Zhao Ziyang stressed, from beginning to end, the central idea of raising economic results. The deputies have called them excellent plans and sound strategies for pursuing the four modernizations and for bringing benefits to the people.

The deputies pointed out: The 10 principles put forward by Premier Zhao Ziyang embodied in every way the spirit of raising economic results for the benefit of the people. These principles have, in a sure sense, initiated the road of development of a Chinese-style socialist economy.

In the course of discussion, deputies from Shanghai, Sichuan, Heilongjiang, Xinjiang, Nei Monggol and other provinces, municipalities and autonomous regions have all mentioned this situation: in the course of further readjusting the national economy this year, even the scale of capital construction has been trimmed greatly and the development of heavy industry slowed down; however, because attention has been paid to agricultural and light industrial production, the supply of major goods remained abundant, in spite of brisk buying and selling, and the volume of goods sold and that stockpiled in the warehouses has also increased. Some deputies held: This shows that, as long as the policy is correct and the speed of economic development is set in a practical manner, it is possible to improve economic results to equably benefit the people.

In discussion, deputies from Tianjin mentioned the opinion expressed by Premier Zhao in February this year, when he visited Tianjin during an investigation and study tour. They said: Premier Zhao touched on the ideas of the 10 principles at that time. Since the beginning of this year, in accordance with central instructions and based on market demand, Tianjin Municipality has successively organized more than 180 enterprises to take up other forms of production because they currently do not have enough to do or are producing unsaleable goods. At the same time, steps have also been taken to organize heavy industry to readjust its service orientation and actively develop the production of consumer goods by means of technical renovations and specialized coordination to give a relatively high rate of increase in the entire industrial production. The deputies from Tianjin said:

Although some progress has been made industrially, the economic results achieved are far behind Shanghai. They pledged to learn from Shanghai's good experience, together with cadres and workers throughout the municipality and to find out where they have lagged behind, by comparing each and every trade and enterprise with Shanghai, to quickly raise the economic results in accordance with the demands of the 10 principles.

In the course of discussions, Hu Anfu [5170 1344 1122], secretary of the Huimin County CCP Committee, Shandong Province, vividly described the importance of paying attention to economic effects by citing a host of examples in Huimin. He said: Owing to "left" interference in the past, production in our county has always lagged behind. However, by conscientiously implementing the party's rural economic policy, by universally establishing the production responsibility system in the rural production teams and by planting according to local conditions during the past 2 years, cotton production in the whole county this year has increased 100,000 dan and grain production has also increased by 80 million jin; the average income per commune member to be distributed this year is expected to increase from 72 yuan last year to 150 yuan--more than double.

In discussion, some deputies singled out industrial production in 1960 and 1965 for comparison: judged on national industrial output value, 1960 surpassed 1965 by 25.6 billion yuan, but because light industrial goods only took up 1/3 of industrial production in 1960, many products were of poor quality, the source of supply was limited, supply fell short of demand and tremendous difficulties were experienced in state construction and the people's livelihood. On the other hand, even though the 1965 total industrial output value was 25.6 billion yuan less than 1960, because the proportion of light industrial products rose 50.4 percent and the products were of good quality and marketable, the tense supply and demand had eased to satisfy the need in both production and in the people's livelihood. The deputies pointed out: Historical experience has shown us that economic construction proceeds steadily and develops healthily whenever we pay attention to economic results. By ignoring them, we make mistakes and encounter setbacks in economic construction.

In discussing the way to raise economic results, many deputies suggested that resolute efforts should be made to consolidate enterprise management and oppose waste. They held that confusion in enterprise management, poor quality of products, high fuel and raw materials consumption, serious waste, low profit margins, and operating at a loss were incompatible with the demands of the 10 principles. If such problems were not solved quickly, it would be impossible to improve economic results.

On settling accounts, some deputies said: In 1980, the profits realized by our enterprises from every 100 yuan in output value was 1/3 less than in record years; there was a long wait for capital construction, the effect of investment was poor and the cost of business operations was also high. It would be entirely possible to save thousands of dun of petroleum, several million dun of coal and scores of billion yuan in capital, if we consolidate these fields and put economic results into full play.

The deputies have put forward numerous suggestions for tapping potential in coping with the current situation in the enterprises. Deputy Liu Zhenghao [0491 2582 3185], secretary of the Shenyang Municipal CCP Committee, said: As far as the present situation in enterprises is concerned, there are four areas in which we can tap potential to taise economic results--by readjusting the structure of products, by improving enterprise management, by carrying out technical renovation and by enlarging foreign trade exports. Some deputies also said: Our country has a solid foundation for economic construction; we have nearly 400,000 industrial enterprises. But, a considerable number of enterprises' economic results either lag behind the international advanced level or have not reached the record level attained in the past. The 10 principles elaborated by Premier Zhao are indeed the magic weapon to make the country prosperous, the people wealthy and are a good way to make, accumulate and use money. Implementing these 10 principles well, greater social wealth will be produced on the existing economic base in our country, thereby bringing about a great advance in the entire national economy and in raising the level of the people's material and cultural life.

GUANGDONG ADOPTS OPEN HAINAN DEVELOPMENT POLICY

OW031416 Beijing XINHUA in English 1224 GMT 3 Dec 81

[Text] Guangzhou, 3 Dec (XINHUA)--The Guangdong provincial government has recently decided to adopt an open-door policy for the development of tropical Hainan Island which has abudnant natural resources. Preferential treatment will be given to overseas investors starting enterprises or joint ventures with China on the island as in special economic zones, authorities of the province announced.

The provincial government plans to use foreign investment in the development of Hainan Island in accordance with the state external economic policy and unified planning of the province. Foreign trade and tourist industry will be expanded. At the same time, provincial authorities said, special shares for construction will be issued and the rate of interest for bank savings deposits raised to pool unused money for the same purpose.

Hainan Island, with a total area of 32,200 square kilometers, is second only to Taiwan in size.

Foreign capital and technology will be used mainly to expand cultivation of tropical and subtropical plants, tropical forestry and timber industry, animal husbandry, breeding of aquatic products and tourism, and to improve energy production, communications and traffic. South of the Tropic of Cancer, the island is noted for rubber, cocoa, coffee and other tropical plants.

As far as income tax is concerned, foreign investors will enjoy preferential treatment as in the province's special economic zones of Shenzhen and Zhuhai. The rate of income tax levied on the enterprises in the special economic zones is, in general, 15 percent, according to the regulations on special economic zones in Guangdong Province adopted in August last year.

The Chinese side in a joint venture or an enterprise undertaking cooperative production on Hainan Island will claim a smaller proportion of the total profits than it does in an enterprise in a special economic zone. Charges for the use of land for new enterprises on the island will be less and the workers' wages lower, authorites added.

In addition to starting enterprises or joint ventures with China, foreign and overseas Chinese business people are welcome to undertake compensation trade or contract processing orders.

SOLUTIONS TO RURAL ENERGY PROBLEMS IN ARID NORTHWEST AREA

Beijing NONGYE JINGJI WENTI [PROBLEMS OF AGRICULTURAL ECONOMICS] No 10, 1981
pp 57-58

[Article by Zhang Qinghai [1728 1987 3189] of the Agricultural Engineering Research and Design Institute: "Practical Solutions to Rural Energy Problems in Arid Areas of Northwest China"]

[Text] In our study of practical solutions to the structure of the rural energy problem, we recently conducted some investigations in Yongjing County of Gangsu Province.

I. Present Condition of Rural Energy in Yongjing County

Although the natural and geographic conditions of Yongjing County are representative of the arid areas in northwest China, there are unique characteristics in transportation and electric power as well. In the area of conventional utilization of energy resources, Liujiaxia Hydroelectric Power Station--China's largest--is located in Yongjing County. Because of the advantage of location, all the communes in the county are wired for electricity and 50 percent of the production brigades are equipped with electric lights; on the other hand, not much oil is used and although coal is available, there are large subsidies by the state. Because life is difficult for the peasants, few households use coal. Food and fuel are the two biggest problems today. There circulates a saying in the villages: "When housewives face the stove, tears come to their eyes." The lack of firewood has caused many serious problems in the peasants' living and production. Food and fuel are two closely tied facets of one problem. Take Xiaoling Commune in Yongjing County as an example: The per mu grain yield in 1980 was only 170 jin; average grain allocation per person was 440 jin; each person could only have 100 jin of crop stalk per year for burning and a household of 5 or 6 could have 500-600 jin of crop stalk per year. After the policies are put on a solid basis, basically 1 jin of stalk for 1 jin of grain can be realized. A household of 5 or 6 can have 1,200-1,500 jin of stalk per year. How is this fuel used? If burning coal, a household of 5 needs 300 jin per month. If using stalks as fuel, at least 500 jin are required, only 16-17 jin are available per day. (Each kilogram of stalk has 3,500 kilocalories of heat of combustion). In other words, in the past, the yearly share of stalk per household could only last 1 month, and their share now can last 2 to 3 months at the most. But today each household keeps an average of 1 to 1.5 donkeys. They say now is the time for old cattle to plug along and for the donkey to bear a heavy load, and yet each donkey needs at least 800 jin of feed per year, therefore, the crop stalks appropriated to each household must now be used as feed, as well as burning fuel.

Where does the peasants' cooking fuel come from? There are three sources: (1) Go up to the mountains to dig up the sod and grass roots, break tree branches, and strip tree barks. (Provincial comrades said that people at some places use tractors to dig up roots of red willow are well developed and commonly known as the underground forest.) (2) Use livestock dung as fuel, and (3) Exchange grain and potatoes for coal (one jin of potato for 2 jins of coal).

In the search for fuel, the peasants not only spend great amounts of labor each year but the vegetation suffers damages, the ecological environment increasingly deteriorates and the ability to resist natural disaster becomes weaker. If this situation continues, the question of whether our descendents can still live on this land is really worth studying.

Are we pessimistic? No! There are ways out of this and hope can be restored, the key is to recognize the problems and make a great effort to do something. We are convinced that with strengthened leadership, correct method and policy, and the hard work of the industrious and courageous northwestern people, the "adverse situation" can be changed.

II. Energy Structure and Construction Method in Arid Rural Areas

On the surface, fuel shortage in the arid rural areas in northwest China may appear to be a problem in the livelihood of the peasants, but it is in essence an agriculture production problem. Destruction of the fundamental conditions for production leads to a vicious cycle between production and livelihood. In order to check and change this situation, there is but one solution in the long-term interest and that is to plant trees, work on afforestation, maintain the mountains and plant grass. When trees and grass grow up, they will not only provide good production conditions for agriculture, create a sound ecological environment but they will also provide people with lumber and firewood.

Concerning afforestation, some people say: "Distant water does not relieve immediate thirst." But a journey of a thousand miles starts with just one step, we must work on "distant water" now, otherwise it will never be available. "Immediate thirst" must be solved as well, and it takes something realistic and reliable. In this respect solar furnaces and economic wood- and coal-burning stoves are the most realistic and practical solutions. In 1980 Yongjing County introduced 2,976 solar furnaces, the public response has been very good and there are urgent demands for popularization. "Solar furnaces are great, they can boil water, make flapjacks and cook rice and they don't need firewood or coal," comments the public, "with a solar furnace in the house, it takes a load off the women's backs." Some people even bought solar furnaces for their daughters as wedding presents. Why are solar furnaces so popular among the peasants? A study shows the following reasons:

1. The northwest loessial plateau is located deep inland, far from oceans and at a high altitude, there is abundant sunshine. The annual rainfall is only

about 250-500 mm, the weather is dry and there are 2,500-2,900 hours of sunshine per year, the total annual radiation is 145 kilocalories per square centimeter, all these have provided a strong material basis for effective development and utilization of solar energy. There are about 210 days in a year when solar furnaces can be used.

2. Solar furnaces are compatible with the working and eating habits of the local public. Here people are used to eating steamed buns, noodles and potatoes as their main staple, potatoes serve as bread as well as a vegetable. The work schedule of commune members generally calls for working in the fields beginning at 5 or 6 o'clock in the morning and going home for breakfast at 8 or 9 o'clock. At breakfast time the solar energy efficiency is high and can be used to steam buns, boil potatoes or make flapjacks. At lunch the solar heat efficiency is even better and it takes only a short time to steam buns or boil water. It solves the problem of making tea and steaming buns for lunch and it also provides abundant boiled water for use at night. After going home at night, boiled water is put into the pot and noodles are cooked without using much firewood. On sunny days there is essentially no need or very little need for any other fuel. At least 50 percent of the fuel can be saved over the year.

3. Solar furnaces are technically simple and convenient to operate. The solar furnaces in Yongjing County have an opening area of 2.2 square meters and a projection area of 1.9 square meters, they have basically been standardized. The furnace body is small and light, the height of the pot and tilt of the furnace can be freely adjusted according to the angle of the sun so the peasants found them safe and convenient.

4. Solar furnaces require little investment and have high thermal efficiency. Each furnace requires only 35 kilograms of concrete, 22.5 kilograms of steel, 2 square meters of mirror and costs 50-60 yuan. When the sunshine is good, it takes only 20 minutes to boil 3 to 4 kiloliters of water. Its power is equivalent to a 1 kilowatt electric furnace.

Today in the villages the furnaces that burn firewood directly are passed down from generation to generation. Judging from the situation and ability in China, these furnaces still need to be used for another 10 to 20 years. Practically speaking, furnaces will still be used no matter what energy sources are being developed, northwest arid areas are no exception. In recent years there are two problems in the use of rural furnaces: first they consume large quantities of firewood and second their thermal efficiency is too low (only about 10 percent). In the past few years a number of places in China have modified and produced some fuel economical and thermally efficient furnaces; if they can be popularized in the northwest region, the value will be even greater. Based on the discussion given above we can see that although there are some variations in geographic and natural conditions and energy resources in the entire northwest area, there is one thing in common, namely, from the viewpoint of long-term interests, great efforts must be made in afforestation, protection of the mountain and planting grass. Based on the practical conditions, solar furnaces and economic wood-burning and coal-burning stoves must be promoted actively. As for small hydroelectric power, small coal pits and wind energy, some of the regions in northwest China are quite promising. Places with favorable conditions for these energy sources should exploit these advantages sufficiently and combine them in a flexible way so that they can gradually stop the practices of breaking tree branches, stripping tree barks, digging up grass land and roots, and burning livestock dung; let trees and weeds grow quickly and restore ecological equilibrium. This is the structure of energy construction and solution to the energy problem of rural areas in northwest China.

IMPROVEMENT OF CEMENT QUALITY STUDIED

State Council Notice

Beijing SHUINI [CEMENT] in Chinese No 10, 10 Oct 81 p 2

[State Council Notice on Further Improvement of Product Quality by Small Cement Enterprises as Proposed by the Ministry of Building Materials and State Economic Commission--State Document No 125, 1981]

[Text] To all provincial, municipal and autonomous regional people's governments and all ministries, commissions and other relevant organs directly under the State Council:

The State Council has approved the "Report on Further Improving the Product Quality by Small Cement Enterprises" submitted by the Ministry of Building Materials, the State Economic Commission, the Ministry of Agriculture, the Industry and Commerce Central Bureau and the State Standardization Bureau, now being forwarded for careful study and implementation.

Cement is one of the principal materials for state construction as well as housing construction for people in urban and rural areas, and its quality has a direct bearing on the national economy and the people's livelihood. At present, the poor quality of the products of some small cement enterprises should be carefully attended to. All localities and departments concerned should adopt positive measures of improvement and strive to raise the quality of the products of small cement enterprises. With a keen sense of responsibility to the state and the people, they should guarantee that the quality of cement leaving the factories is up to the required standard, and strictly forbid any product without a fitness certificate from leaving the factory.

The State Council of the
People's Republic of China.

20 August 1981

Report to State Council

Beijing SHUINI [CEMENT] in Chinese No 10, 10 Oct 81 pp 3-5

[Report on Further Improvement of Product Quality by Small Cement Enterprises]

[Text] To the State Council:

The small cement industry has developed rapidly in our country. In 1980, their output was 54.27 million tons, 68 percent of the total cement output. This output has helped ease the contradiction between supply and demand in cement; and because of its orientation to the countryside, it has also played a great role in satisfying the needs of 800 million peasants. Along with the development of the rural economy and the enlarged scope of rural housing construction, the task for the small cement industry will be even heavier.

The small cement industry developed under crude conditions with limited self-raised local funds, at a time when the contradiction between supply and demand was acute and conditions were difficult with regard to funds, equipment and material. Therefore, most of these enterprises are using backward equipment with incomplete technical accessories. They are weak in technology and poor in management, and these factors generally account for the inferior quality of their products and their high production costs. In the past several years, particularly since the 3d Plenary Session of the 11th Party Central Committee, the construction materials departments and small cement enterprises in various localities have earnestly implemented the policy of readjustment, restructuring, consolidation and improvement, and have done a great deal of work in consolidating and improving the enterprises, in building up a technical force, and in strengthening business management with particular emphasis on improving the product quality and lowering the production costs. The situation has now begun to improve. In 1980, 85 percent of the products--12 percent higher than in 1978--of small cement factories at or above the county levels throughout the country were up to the required standard. However, many small enterprises are still attaching more importance to the output than to the quality, and in 1980, more than 3 million tons of rejects were delivered from these factories, while some 9 million tons did not go through any quality check according to state standards in the factories (and 80 percent of the products of small cement enterprises run by communes or production brigades and teams were not checked on at all). This practice has seriously affected the quality of construction engineering.

The quality of cement has a close bearing on the national economy and the people's livelihood, and particularly on the immediate interests of the 800 million peasants. Therefore, streamlining and improving the quality of products by small cement enterprises are extremely important tasks for the cement industry, and these tasks must be carefully attended to during the period of readjustment.

Here are our views on further improving the quality of cement:

1. The laboratories should be reorganized, and means of quality control and inspection should be adopted and perfected in order to insure that the quality

of products is up to state standards. A thorough reorganization should be conducted on existing laboratories of enterprises before the end of 1982 according to state standards and as required by the regulations for quality control in small cement enterprises. After the reorganization, the laboratories should be inspected by the provincial, municipal or autonomous regional departments in charge, and be given "certificates of fitness." Any enterprise without a laboratory must set up one before the end of 1982. If any enterprise fails to obtain a "certificate of fitness," the provincial, municipal, or autonomous regional bureau (in combination with the commune and production brigade enterprise administration bureau of the province in the case of a commune- or production brigade-run enterprise) will refer this enterprise to its local industrial-commercial department together with a signed recommendation by the standardization bureau, for the business license of the enterprise to be revoked. This enterprise will then have to suspend its business operation for a consolidation to be completed within a time-limit. It can resume production only after its products have passed the required inspection and after approval and a new business license have been obtained from the provincial bureau of construction materials, the standardization bureau and the industrial-commercial administration bureau.

2. Selling rejects must be strictly forbidden. Beginning from 1 January 1982, any enterprise permitting its rejects to leave the factory, besides accepting the returned goods for a full refund, replacing these goods and compensating the customers' losses, will be suitably dealt with by the industrial-commercial department. It may be warned, punished or it may forfeit its business license according to the seriousness of the offence. Any enterprise found to be fraudulently covering up problems of product quality will receive disciplinary action from its department in charge. The disciplinary action or criticism will be publicized throughout the province. Should any untoward incident result from the use of inferior materials in engineering projects, the responsible person would be severely dealt with.

3. Supervision and inspection of the quality of small cement products should be strengthened. The local cement inspection organs being set up or already set up will serve as the core of inspection for the quality of these products (including the small cement products of communes and production brigades and various trades). While the business administration of these small enterprises are under the joint leadership of the provincial standardization bureau and the provincial building materials bureau, the task of supervision and inspection o the quality of small cement products will be undertaken by these inspection organs throughout the province. Whenever there is any complaint from the users on the quality of the cement, the local cement inspection organ in the province, municipality or autonomous region will act as the arbitrator. If the quality is found to be inferior, then the producer will have to accept the returned goods and pay the compensation. If the producer resorts to any unethical tactics (such as cutting off the supply of goods) instead of making any restitution, the user may appeal to the local economic arbitrating organ or the department in charge of the enterprise which, in collaboration with the industrial-commercial administration department, will mete out punishment for the enterprise, revoke its business license, or take other forms of disciplinary action.

4. In accordance with plans for development and distribution in the small cement industry, there will be no building of new plants (including small cement factories run by communes, production brigades and various trades and undertakings). Application for the building of new plants must be approved by the provincial, municipal or autonomous regional authorities; otherwise it will not be registered by the industrial-commercial administration department.

The small cement factories (including those built by the communes, production brigades and various trades and undertakings) must be reported to and approved by the provincial, municipal or autonomous regional building materials bureau (or the enterprise administration bureau of communes or production brigades) prior to their operation. The building materials bureau (or the enterprise administration bureau of communes or production brigades) must have ascertained that these factories are in a condition for the regular production of a certain type of cement according to state standards before approving their operation, registering them with the local industrial-commercial administration departments, and issuing them the business licenses. Cement factories having no valid business licenses are not permitted to operate or to open bank accounts.

5. Economic means should be employed for quality control by the small cement enterprises run by communes and production brigades. These small cement enterprises should compute their output in light of quality, pay wages according to the output, hold everyone responsible for the quality, and distribute benefits according to the work done. Finished or semifinished products whose quality fails to meet the required standard are not to be included in the output, and will not be paid for, since the quality of products should be linked with the material benefits of the workers and staff members. The enterprise administration bureaus of all provinces, municipalities, autonomous regions, communes or production brigades should assign special persons to strengthen the control of commune- and production brigade-run small cement enterprises, while the building materials bureaus should provide them various forms of technical assistance.

To do a good job in consolidating the small cement enterprises, all provincial, municipal and autonomous regional people's governments should provide more active leadership in improving the quality of small cement products, and provide the necessary facilities for setting up local cement inspection organs and the means of quality inspection. The economic commission, building materials bureaus and standardization bureaus at the provincial, municipal and autonomous regional levels; the enterprise administration bureaus of communes and production brigades; and the industrial-commercial administration departments should closely cooperate with one another to do this work well.

Should this report be considered satisfactory, please relay it to various provincial, municipal and autonomous regional people's governments together with your comments for their study and compliance.

Ministry of Building Materials,
State Economic Commission,
Ministry of Forestry, and
Industry and Commerce Central Bureau.

FOREIGN TRADE

PROVINCES INCREASE MACHINERY EXPORTS

OW030906 Beijing XINHUA in English 0721 GMT 3 Dec 81

[Text] Beijing, 3 Dec (XINHUA)--Shandong, Zhejiang and Liaoning provinces have increased exports of machinery products this year, according to local branches of the China National Machinery Import and Export Corporation.

In the first 10 months of this year, Shandong in East China, exported 60 varieties of machinery products including tractors and bearings worth more than 15 million U.S. dollars, 33 percent more than 1980's total. The province also has processed three million U.S. dollars worth of machines, bench drills and desk fans according to designs and samples supplied by foreign businessmen.

Shandong's machinery industry produces a wide range of products. The local branch of the China National Machinery Import and Export Corporation, established in 1979, has direct trade relations with more than 20 countries and regions in Southeast Asia, Middle East, Europe and America.

Another East China province, Zhejiang, has signed this year 278 contracts to supply goods to 109 firms in 35 countries and regions. The transactions are expected to treble the 1980 export volume by the end of this year. Trade for processing materials supplied by customers based on their designs and samples and the production of brands specified by users also have been introduced in the province.

Zhejiang's machinery industry has 20,000 machine tools and employs 100,000 workers. Previously, the industry mainly exported standard parts and tools. The province now produces complete sets of machines, electrical equipment, instruments and meters, including equipment for hydroelectric power stations, air separation equipment and diesel generating equipment. Varieties of exports have increased to 300, the local branch of the Import and Export Corporation reported.

The Shenyang No 1 machine tools plant in northeast China's heavy industry base, Liaoning Province, this year exported one-fifth of the province's total machinery for export. In the first 9 months, the plant concluded contracts worth nearly 6.8 million U.S. dollars with foreign businessmen, the local branch said.

Lathes exported by the plant are in 15 varieties, and they are sold to 40 countries and regions.

LABOR AND WAGES

'RENMIN RIBAO' ON EMPLOYMENT, LABOR PRODUCTIVITY

HK020606 Beijing RENMIN RIBAO in Chinese 23 Nov 81 p 5

[Article by Yue Guangzhao [1878 0342 2507]: "Several Questions on Increasing Employment and Raising Labor Productivity"--initial capitalized passages published in boldface]

[Text] For many years, a marked contradiction has existed between the expansion of labor employment in our nation's towns and cities on one hand, and the raising of labor productivity on the other. The satisfactory resolution of this contradiction is related to stability and unity in society and the overall situation of our socialist modernization construction. Therefore, people have generally been concerned with this question.

Undoubtedly, our country has achieved tremendous success in providing employment for workers in the towns and cities. Over the period of 31 years since the founding of the PRC, the total number of workers and self-employed urban laborers has increased from 15.33 million at the end of 1949 to 105.25 million at the end of 1980, an increase of nearly 590 percent. Because of the expansion in employment, the number of persons supported by each employed person in a worker's family (and this includes the worker) has decreased from 3.6 in 1952 to 1.83 in 1980. This change has played a very important role in ensuring the availability of a labor force needed for production and construction, the maintenance of stability and unity in society, and the improvement of the livelihood of urban workers' families.

However, the productivity of workers of the enterprises has grown rather slowly. If one considers the industrial enterprises under the system of ownership by the whole people, their labor productivity increased from 3,004 yuan in 1949 to 12,031 yuan in 1980, an increase of over 300 percent. If the total value of the output of our country's industrial enterprises under the ownership by the whole people was taken as 100 in 1949, then in 1980 it was 3,520, more than 35 times the 1949 figure. During the 31-year period, the total value of industrial output increased by some 3,400 percent, but labor productivity increased by only some 300 percent or more. Naturally, there are many factors affecting increases in the productivity of workers of enterprises. However, excessive increases in the number of workers employed by enterprises constitute a very important factor.

Can we choose between expanding employment of urban labor and raising of labor productivity by striving to achieve one at the expense of the other? This is possible under special circumstances. For example, during the decade of turmoil, tens of millions of urban young people awaiting employment remained unemployed. After the smashing of the gang of four, various essential economic conditions were not yet ripe. The expansion of employment had to be taken as a very important task in an attempt to achieve stability and unity in society. Another example was that in 1959 to 1961, our country experienced grave difficulties in its national economy. Yet, after this, in 1961 to 1964, we reduced our work force. Consequently, during the 1963 to 1965 period, the overall labor productivity of the industrial enterprises rose by an average annual rate of 23.1 percent. The time needed for overcoming the economic difficulties was greatly reduced. However, basically speaking, a protracted neglect of either the expansion of employment, or the raising of labor productivity, will bring about undesirable results.

The problem facing us is whether we can rather substantially raise the productivity of workers of enterprises while, at the same time, we are working to expand labor employment. I think this is possible. However, to turn possibility into reality, we must formulate appropriate principles and policies and adopt appropriate measures on the basis of unified ideology and understanding.

1. We Must Readjust the Industrial Structure and Ownership Structure. Regarding our industrial structure, for a considerable number of years after the founding of the PRC, we overly stressed the development of industry. Moreover, we overly stressed the development of certain heavy industries and relatively neglected the development of light industry, commerce and the service trades. Regarding the ownership structure, we developed the economy solely under the ownership of the whole people. We placed restrictions on the collective economy and suppressed and banned the individual economy, Consequently, the development of the entire national economy was affected and many channels of labor employment were blocked. The irrational industrial structure has led to an irrational distribution of workers. On one hand, over 50 percent of the new workers are assigned to the industrial sector, and moreover, 70 percent of these workers are assigned to the sector of heavy industry, so that the raising of labor productivity in these sectors is affected. On the other hand, many service trades and some of the trades that produce consumer goods lack workers. Because the ownership structure is irrational, the urban young people awaiting employment very often can only seek employment in the enterprises under the ownership of the whole people, and thus the personnel of these enterprises continue to increase. However, in society, there are many kinds of work which there is no one to perform. Conditions can be created for expanding employment only if the industrial structure and the ownership structure become rational through readjustment. The number of workers who can be accommodated is limited if we expand employment merely by developing heavy industry. Moreover, our country is incapable of doing this with its available financial and economic resources. In developing light industry, the handicraft industry, commerce, the service trades and the production of other consumer goods, we whould minimize resorting to the form of state-operated units whenever collectively or individually run units are appropriate. Then, the urban young people awaiting employment will not continue to surge into the heavy industry sector and the enterprises under the ownership of the whole people, where the personnel are already in excessive numbers. Thus, the contradiction between expanding employment and raising the productivity of workers of the enterprises can be relatively satisfactorily resolved.

2. We Must Implement the New Employment Policy. Since the founding of the PRC, a system of labor employment whereby the labor departments monopolize the employment and the allocation of labor has gradually been formed. This is very closely related to the system of ownership by the whole people, marked by reliance on a single economic sector. By practicing this system, the labor departments intend to rationally allocate the labor force in a planned way and according to enterprises' needs, so that all those awaiting employment can be appropriately accommodated. However, the actual results turn out to be contrary to this subjective desire. In fact, the technical conditions and professional work of various trades are extremely complicated, and the professional skills and interests of those awaiting employment differ vastly. The labor departments are incapable of allocating the workers very rationally. In particular, the labor departments neither possess the ability to undertake the assignment of jobs to all those in the towns and cities awaiting employment, nor will permit those awaiting employment to find their own ways to earn a living. It is obviously unwise for them to adopt such a policy. In 1980, the party Central Committee called a national work conference on labor employment, at which a policy for solving the problem of urban labor employment was put forth; namely, to integrate the arrangement of employment by the labor departments with the creation of employment on the basis of voluntary organization and with the seeking of jobs through people's own efforts, under the guidance of overall state planning. Moreover, when the enterprises need to recruit workers, they should be encouraged to invite applications from the public and to choose the better candidates for employment. The practice over the past year has proved that this policy is absolutely correct. Aside from the recommendation of jobs to young people, awaiting employment by the labor departments and in the light of the needs of enterprises and various institutions and so on, many young people previously awaiting job assignments have established enterprises which are under collective ownership, or have worked on a self-employed basis, according to the principles of voluntary association, assuming sole responsibility for profits and losses, distribution according to work done, democratic management and so on. Thus, their employment problem has been solved.

3. We Must Reform the Labor System and the Wage and Welfare System. In employing workers, the state enterprises only recruit workers and do not dismiss any. In the distribution of wages, they indulge in egalitarianism. They are also too involved with labor insurance and welfare. This is disadvantageous to rousing the staff's and workers' enthusiasm in work and ensuring the satisfactory running of the socialist enterprises. A policy formulated in the past stipulates that with regard to standard wages, labor insurance and welfare, workers of the state enterprises must enjoy superiority over those of enterprises run by larger collectives, who in turn must enjoy superiority over workers of enterprises run by smaller collectives. There is no social insurance for self-employed workers. Thus, the urban young people awaiting employment naturally aim to work in the state enterprises, or at least the enterprises run by larger collectives (because even though the workers of such enterprises earn less than those of the state enterprises in terms of wages and other benefits, they earn more than workers of the enterprises run by smaller collectives and self-employed workers). They are not interested in, and have misgivings about, joining the enterprises run by smaller collectives or becoming self-employed workers. To put an end to these undesirable phenomena, for one thing, we must create conditions for the gradual reform of the labor system and wage and welfare system adopted by the state enterprises, and for another thing,

we must give the requisite support and assistance to the workers of enterprises run by collectives and self-employed workers, so that their income will not be lower than the remuneration of workers of state enterprises and the opening up of many channels of employment will be facilitated.

4. We Must Do a Good Job of Operating Labor Services Companies. For one thing, this can help reduce the workload of the enterprises in accommodating young people awaiting employment. For another, this can enable the enterprises to expand or reduce their personnel according to their needs. By satisfactorily running labor services companies the regulation of labor force will be assisted. Such companies are like "reservoirs." The labor services companies under the leadership of local labor departments can perform a number of functions, such as helping those awaiting employment to develop the collective economy or to seek employment by themselves, launching prevocational training, recommending workers to enterprises, exercising supervision over young people awaiting employment and educating them, helping enterprises accommodate surplus manpower when conditions are ripe, and so on. Moreover, all those factories, mines, enterprises, agencies, organizations and schools which are in a position to establish their own labor services companies may also run such companies, so that they can accommodate the surplus manpower in their own units and also organize and provide guidance to the children of their staff and workers who are awaiting employment so that these young people may help establish collective economic units which undertake independent accounting and assume sole responsibility for their own profits and losses, or work on a self-employed basis. To this end, the authorities concerned must provide the necessary support and assistance in connection with things such as funds for establishing such companies, channels of supply, production and marketing, premises for operating such companies, financial and taxation policies, and so on.

5. We Must Adopt an Appropriate Policy Regarding Technology. Our country has a large population and every year there are large numbers of new workers in the towns and cities who need the government's help in finding jobs. On the other hand, our country must adopt modern and advanced technology and continuously raise labor productivity so that it can achieve the magnificent goal of the four modernizations. To resolve this contradiction, we can only proceed from our country's real circumstances and adopt an appropriate policy regarding technology. We may consider the following idea. In principle, those key enterprises which are important to the overall situation of our national economy or important in relation to the modernization of national defense must adopt modern and advanced technology. We must vigorously grasp the technological transformation of all such enterprises which are currently technologically backward and enable them to gradually attain advanced world standards. These units must employ personnel according to advanced and rational criteria for fixing the number of staff members, and must strive to achieve higher labor productivity. Other categories of enterprises can pay greater attention to the expansion of employment. They do not necessarily need to use advanced technological equipment to reduce the employment of manpower. Our country has an abundant labor force and labor costs are low. Therefore, we have particularly favorable conditions for developing the labor-intensive types of production such as handicrafts. We should strive to bring this superiority into play.

6. We Must Strengthen Prevocational Training. At present, except for the graduates of universities, colleges, secondary technical schools and other schools for training mechanics and technicians, who are subject to centralized allocation, most of the urban young people awaiting employment are given training before they are employed. This will be advantageous to production. This will enable them to relatively quickly begin to play a positive role in production. On the other hand, the employment by enterprises of large numbers of untrained young people awaiting employment will inevitably lead to a fall in the political and ideological quality as well as technical and professional standard of the staff and workers of enterprises, and will inevitably impede the consolidation of labor discipline and the raising of labor productivity at enterprises. Generally, the urban young people awaiting employment have only received secondary education and do not possess technical and professional knowledge. Without undergoing the requisite training, they will not only be incompatible with the needs of enterprises under ownership by the whole people and enterprises run by the collectives, but will find it difficult to organize collectively-run enterprises by themselves or to work on a self-employed basis. Therefore, we must resolutely and vogorously start prevocational training work.

7. We must Rigorously Control the Urban Population. To resolve the contradiction between expanding urban labor employment and raising the productivity of workers of the enterprises, we must grasp the control of the urban population as a major task. The methods of control are: First, adhering to birth control; second, rigorously controlling the flow of rural workers into the cities; and third, adopting measures to encourage the urban young people awaiting employment to undertake farming and the breeding of aquatic products in those towns, cities, forest regions and industrial or mining regions with suitable conditions. The practical experience gained in many localities has proved that this is feasible.

8. We Must Bring the Expansion of Employment and the Raising of Labor Productivity in Enterprises in Line With National Economic Planning. The expansion of employment and the raising of labor productivity are related to the overall situation of the national economy. Such questions should be an important part of national economic planning. What we call bringing these matters into the scope of planning naturally does not amount to simply including a few figures in our plans. It requires us to formulate practical and effective measures. Such matters as the strengthening of prevocational training, the readjustment of our industrial structure and ownership structure, the adoption of appropriate policies regarding technology, the reform of the labor system and wage and welfare system, the satisfactory operation of labor services companies, and so on, involve the attainment of comprehensive equilibrium in human, financial and material resources in our national economic planning. Our national economic plans must provide the necessary human, material and financial resources so that the successful handling of these matters can be ensured.

LABOR AND WAGES

TU OFFICIAL STRESSES NEED FOR MODEL WORKERS

OW081214 Beijing XINHUA in English 1200 GMT 8 Dec 81

[text] Beijing, 8 Dec (XINHUA)--Wang Chonglun, noted national model worker and vice-president of the All-China Federation of Trade Unions, today called for attention to the bringing up of a large number of young model workers.

Wang Chonglun is now attending the National People's Congress as a deputy from Liaoning, northeast China. "Without young models," he said, "our cause will be greatly affected."

"Advanced workers are a vital force in production. They can help to improve economic performance and productivity and speed up the entire national economy as a whole," he said.

Wang Chonglun distinguished himself in the early fifties by introducing a universal fixture which greatly raised productivity, when he was working in the Anshan Iron and Steel Company in northeast China. At that time, he was only a little over twenty in age. Later, he made more innovations.

Most of the older model workers, who contributed a lot to China's industrial growth, are no longer working in the forefront of production, he said. The average age of the model workers who attended the national worker-peasant-soldier model labourers conference in 1950 is now 68, and over 70 percent of the model workers attending the 1956 national advanced workers' conference have reached the age for retirement.

"There is only a small number of model workers under 30 among the several million young workers," he said.

"This is because in the twenty years between 1960 and 1979 no national model workers' conferences were held," he said. China held four model workers conferences in the fifties.

He proposed to convene another national model workers' conference as soon as possible and commend a large number of young model workers.

He also made the following points:

First, correct criteria must be followed in choosing model workers. Those who are selected as model workers must have made outstanding contributions in socialist construction and have played a big role in raising productivity and improving economic performance.

Second. The outstanding deeds of the model workers must be widely publicized as an important part of the effort to enhance the socialist mentality.

Spreading their advanced skills and experience is a good method for increasing industrial output, improving quality and lowering cost without adding investment.

Third. Leading organs at various levels must strengthen their work to educate the model workers and help solve their difficulties.

"Model workers should not be asked to attend too many social activities, neither should they be assigned too much administrative work. They should spend most of their time in production," he demanded.

TRANSPORTATION

BRIEFS

CAAC TARGET ACHIEVEMENTS--Beijing, 30 Nov (XINHUA)--The General Administration of Civil Aviation of China (CAAC) had met its 1981 quotas by 10 November, CAAC announced today. The total income drawn by CAAC from 1 January to 10 November from passenger, cargo and mail transport surpassed the quota for the entire 1981 by 15 percent. The total amount of passengers, cargo and mail calculated in terms of ton/kilometers that CAAC handled during the same period was 112 percent of the annual target. CAAC attributed its success to redoubled efforts made in 1981 to improve its service. This year CAAC has opened two international air lines (Beijing-Shanghai-San Francisco and Beijing-Shanghai-San Francisco-New York) and three regional air lines (Tianjin-Hong Kong, Nanjing-Hong Kong and Kunming-Hong Kong). Chartered services were established between Hong Kong and some tourist spots. [Text] [OW041229 Beijing XINHUA in English 0813 GMT 30 Nov 81]

DEVELOPING WATER RESOURCES--Beijing, 7 Dec (XINHUA)--Central and local governments, factories and mines are urged to build wharves at sea and river ports to develop China's water transport, reported today's WORKERS DAILY which carried a statement made by a central government leader at a forum in mid-November. The forum was attended by leading members of the State Economic Commission, State Planning Commission, State Capital Construction Commission and ministries of railways and communications. He suggested to open more ports to serve the growth of foreign trade and other external economic activities. The construction of large, medium and small projects of water transport should be undertaken simultaneously, he added. Local governments and enterprises should be encouraged to build wharves, set up fleets and more (?ports) for handling cargoes. With its long coast line and crisscrossed inland rivers, China has good conditions for developing water transport, which requires less investment and consumes less energy. It is necessary to make an overall planning for the building of railways, motor roads and water transport. [Text] [OW070941 Beijing XINHUA in English 0835 GMT 7 Dec 81]

GENERAL

SYMPOSIUM HELD ON EFFECTIVE CONTROL OF PRODUCTION COSTS

Beijing CAIWU YU KUAIJI [FINANCE AND ACCOUNTING] in Chinese No 9, 20 Sep 81 pp 10-12

[Article by unidentified correspondent: "Attach Importance to Cost Control and Cost Research--Summary of Proceedings of the Second Theoretical Discussion Meeting Held by the China Cost Research Association"]

[Text] The second theoretical discussion meeting held by the China Cost Research Association took place recently in Wushi municipality with some 140 representatives attending. A report given in written form by Yu Guangyuan [0060 0342 6678], honorary president of the China Cost Research Association, on the way to strengthen cost control during the economic readjustment as a means of lowering production costs was read out; Xu Yi [6079 3015], president of the China Cost Research Association, and Ji Chongwei [1323 1504 1218], deputy secretary of the China Enterprise Management Association, delivered academic reports on "The Relationship Between Macroeconomic Policy Decisions and Production Costs" and "A Higher Level of Cost Research To Promote Economic Readjustment and the Four Modernizations" respectively. The representatives firmly adhered to the principle of "letting a hundred schools of thought contend" throughout the meeting and particularly stressed the following points in light of the theory and practice of production costs:

I. Great Significance of Cost Control During the Economic Readjustment Period

The representatives unanimously held that strengthening cost control and striving to lower production costs should be highly regarded by all production and business units, because of their great significance particularly during the period of economic readjustment. Besides readjusting the relationship between accumulation and consumption, reducing the scale of capital construction and developing production--especially agricultural, light and textile industrial, energy and raw material industrial production--the basic way to fulfill various tasks during the readjustment period, to bring about financial and credit balances, and to preserve the basic stability of commodity prices is to strengthen management and control, to improve economic results, and to achieve the unity of greater, faster, better and more economic results.

Many representatives emphasized the practical significance of lowering production costs in wiping out financial deficits. For various reasons, for many years great loss and waste have been common in all economic activities. There is great potential in all industries to lower their production costs. If great efforts are made to tap this potential, it is possible to increase our income by billions, tens of billions or even hundreds of billions of yuan by lowering our production costs. A good job in lowering production costs means an important contribution to the success of the economic readjustment.

Some representatives pointed out the laxity and negligence in the work of cost control. To change this situation, it was the general opinion that besides readjustment and restructuring, consolidation was also necessary as a means of improving economic results. In a certain sense, greater attention to consolidation may even produce better effects. Cost control has to be consolidated not only in enterprises where production is sluggish, remains at a standstill, or even declines, but also in the light and textile industries with fairly rapid production growth and various "guarantees," in order to change the lax, perfunctory, chaotic and extravagant methods of cost control.

Some representatives pointed out the need to strengthen cost research in order to lower production costs during the period of economic readjustment. While agreeing on the great potential for all trades to lower their production costs, the participants pointed out certain factors in the rise of such costs (or expenditures). They shared the view that "the higher the level of mechanization, the greater the production cost" was particularly applicable to the mining and lumbering industries. It was generally agreed that in real economic life, further investigations should be carried out into the factors of the changes of various economic conditions and of production costs; into the influence of various policies and measures adopted during the period of economic readjustment on production costs; into the influence of production costs of various trades on one another; and into the trend of development. This method will help strengthen cost control and lower the production costs, and will provide cost data for the decisionmakers.

II. Production Costs as Important Data for Macroeconomic Policy Decisions

Study of cost control through a combination of macroeconomic and microeconomic methods was one of the important topics explored at the theoretical discussion meeting. During the first meeting dealing with production cost theories, it was proposed that the new topic of production costs should be studied from the macroeconomic point of view, and this study was given attention by various quarters for more than half a year. At the present meeting, some comrades further pointed out the importance of production costs as data for macroeconomic policy decisions. They held that for a long time in our country, there has been the problem of heavy investments with poor returns in economic construction, while financial deficits and price instability appeared in recent years as the result of damage from the leftist thinking. One important reason why the leftist thinking was able to play havoc with our national economy was that no cost accounting was conducted on the input, output, consumption and effects in our national economy. Consequently, our macroeconomic policy decisions lacked data, and serious errors ensued. These comrades held that production costs were the basic criterion for the assessment of economic results, and that the use or waste of funds would be reflected in the production costs. To work out a correct macroeconomic policy decision and to find a new way of reducing investment and increasing benefits, therefore, cost control must be strengthened.

Some comrades held that although macroeconomics was closely related to production costs, macroeconomic policy decisions were not solely based on the question of production costs, since there were also the questions of investment returns and social effects to be considered. Therefore, they affirmed, it would be more correct to say that "production cost is one of the important items for macroeconomic policy decisions." Some comrades agreed on this point and further suggested that a correct macroeconomic policy decision should also be an important prerequisite for cost control. They held that errors in a macroeconomic policy decision would cause problems to cost control and place it in a passive position. In making any macroeconomic policy decision, therefore, consideration should be given to the effects of such a decision on microeconomics and the production costs of an enterprise. Other comrades held that, generally speaking, the effects of a macroeconomic policy decision on the production cost of an enterprise should be noted, but not exclusively, since there should be many other questions to be considered in making such a decision. There should be an overall balance, and the choice of a plan promising the best comprehensive economic result. This plan, however, might not necessarily bring about the lowest possible production cost for an enterprise.

Many comrades held that cost control should be strengthened from the macroeconomic point of view, beginning with microeconomics. The "leftist" influence on economic work, the damage from the "10 years of catastrophe," the disproportion of the national economy, the various defects in the economic management system, and the mistakes of economic policies caused tremendous loss and waste and created problems in the work of cost control. These problems should undoubtedly be seriously studied and solved. However, as we must be aware, the low level of our enterprise management, the weakness of our cost control, the poor results of various economic undertakings, and the serious loss and waste are inexorable facts. It would therefore be incorrect for us to be concerned with only the macroeconomic aspect and to wait for the solution of external problems instead of striving to accomplish what can and should be accomplished within the enterprises. Some comrades held that macroeconomics and microeconomics are mutually related as well as mutually contradictory. Generally they are in harmony, but sometimes they are mutually contradictory. In our socialist nation, the principle behind the resolution of this contradiction is the subordination of the part to the whole. At present, from the microeconomic point of view, we can see the serious waste in some enterprises "littered with gold everywhere." Therefore, the enterprises should pay great attention to consolidation and strive for lower production costs. From the macroeconomic point of view, we should pay attention to readjustment and streamline the economic structure, the product mix, the organization pattern and other matters. Cost control can be greatly improved only through a combination of macroeconomics and microeconomics.

Many other comrades also put forward suggestions and tentative plans for strengthening cost control from the macroeconomic point of view.

III. Gradual Formation of a Cost Control System With Typical Chinese Characteristics by Summing Up Experiences

The representatives at the meeting unanimously agreed that an important task in cost research was to sum up the experiences in our country and to form a system of theories and methods of cost control--a system with typical Chinese characteristics. Many of them pointed out that for more than 30 years since the founding of the People's Republic, we have had many successful experiences in cost control, particularly during the first 5-year plan and the 3-year readjustment period. Some departments, localities and enterprises were then very concerned with the job of cost control, and they gradually set up a whole system of cost planning, cost accounting, cost inspection and cost analysis, in addition to undertaking and improving such basic tasks as fixed quotas for fixed personnel, inspection of weights and measurements, and firsthand records, all connected with cost control. As a result, many good forms and methods, such as economic accounting for work teams and work shifts, index analysis and separate control at different levels, were introduced. In recent years, many enterprises have carried out overall economic accounting and obtained many good and new experiences. We are entirely capable of interpreting these experiences in terms of systems and theories, and then forming a science of cost control with typical Chinese characteristics.

During the discussion, some representatives also expressed their views on certain related questions as follows:

1. On setting up a system of responsibility for production costs. Some comrades held that the central task of cost control is to set up a system of responsibility for production costs. The fulfillment of this responsibility calls for the control of production costs both vertically and horizontally. Vertically, it should include the entire process of forecasting, planning, managing, accounting, analyzing and verifying production costs. Horizontally, it should include the work of all departments, production workshops, auxiliary workshops, labor departments in charge of production, business operations, designing, workmanship, technology, equipment, supply and marketing, finance and labor, and even the work teams and work shifts to be held responsible for production costs. There should be a good organic combination of both vertical and horizontal controls in order to make cost control a success.

Some comrades held that cost control as a principal aspect of economic accounting should include not only the entire process of production, but also the experiments to be conducted before production, the process of designing, and the processes of circulation and distribution after production. There should be a system of cost responsibility in each of these links or processes so that there is an integration of technology and economy.

2. On the position occupied by cost accounting in the system of cost control. Many comrades pointed out that since cost accounting is the most basic link in the chain of cost control, we should proceed from the existing realities by first strengthening cost accounting in cost control. It was generally agreed that in addition to implementing the "guidelines," streamlining the party's style, and rectifying the violation of law and discipline and the resort to fraud, the following three links should be carefully attended to in strengthening cost accounting: first, conscientiously carrying out the basic tasks of cost accounting, properly setting up firsthand records, strengthening the inspection of weights and measurements, establishing or consolidating various quotas, strictly controlling all incoming and outgoing materials in the warehouses, and clearly defining the authority for writing off losses; second, seriously studying and reforming the system of financial accounting for cost accounting, prescribing the scope of spending on production costs, improving the methods of accounting for certain

items, and studying the regulations of cost accounting in different trades and for different types of enterprises; and third, carrying out a vigorous training program so as to quickly raise the professional level of cost accounting personnel up to the required standard.

3. On cost control planning. There were two different views on the way to strengthen cost control planning. One of them was that the cost index should be a planned index of a mandatory nature, to be passed from higher to lower levels for verification. These comrades pointed out certain defects in both the substance of the index and the method used in cost planning now being relayed to lower levels, and stressed the need for research to be conducted for an improvement. In this case, particular attention should be paid to studying and solving the problem of coordination between the planned cost index--relayed to the lower levels--and various other planned indexes. The other view was that the enterprise should work out its own cost plans, and that in national economic planning, cost planning should not be used as a mandatory index to be relayed to various localities and departments. In working out an income budget, the financial departments could prescribe a certain margin for the lowering of production costs to be used by all localities and departments for reference. Of course, in planning cost control, the state should still adopt certain measures of reform. For example, for the distribution of productive forces and the building of new enterprises, the planning department and the departments in charge of the enterprises should supply a forecast of the production cost of the enterprises' products; the departments in charge of the enterprises should conduct forecasts and check up on the overall average production costs in their own department; and so forth.

4. On the question of cost verification and the linking of bonuses with cost index. Some comrades held that, to solve the problem of linking bonuses with the cost index in a rational way, the question of cost verification should first be properly handled. Some of them said that since profit touches on pricing and other problems, the use of profit as a yardstick of enterprise management efficiency and as the sole criterion for the appropriation of bonus funds might easily lead to overt or covert increases in prices. This would be inconvenient to management and might lead to an uneven distribution of benefits among different departments and trades. Therefore, they favored a coordination of profit index with the cost index and the forming of a complete index system. What index should be used for verifying costs? Many comrades held that the rate of lowering production costs of comparable items or the comparison of the actual costs with the planned costs now being used could not accurately reflect the expenditure or saving of social labor. Some comrades proposed that it would be feasible for the state (through the various departments in charge) to work out standard production costs for various products to be used by the enterprises as the basis for cost verification.

As to the question of linking bonuses with the production cost index, some comrades believed that this practice would not only add to the innate economic power of the enterprise, but also further strengthen its system of economic responsibility. It would particularly remind the workers and staff members of the enterprise of the need to promote the overall interests, and help avoid, or reduce, the one-sided quest for profits and the indiscriminate payment of bonuses. It would also bring about a closer relationship between bonuses and the practice of economy or extravagance. Other comrades favored the division of the bonus fund into two different portions: one portion as a monthly bonus to be linked with production costs, and the other as a yearend bonus to be linked with profits. Another view was that since there was as yet no standard method of computing production costs or any rational and scientific index for verifying production costs, it would be inadvisable for bonuses to be linked with production costs. Some comrades said that with the present ill-defined scope of production expenditures, it was difficult to correctly assess the amount of production costs, especially for new products now appearing in a continuous stream. Since the production costs of some comparable products show a large "reduction" every year, the payment of bonuses would be greatly increased if they were linked with production costs. Moreover, new problems might crop up because of the difficulty of financial control. The majority of comrades were in favor of further study in the question of linking bonuses with production costs. However, as a material incentive for enterprises to be concerned with their production costs, the use of the production cost index as one of the conditions for the appropriation of bonus funds could be considered.

5. On production cost legislation and the establishment of production cost control organs. The comrades attending the meeting unanimously hoped for the formulation of "production cost laws" by the state in order that production costs and their control could be backed up by law and the present confusion and irresponsibility in the control of production cost expenditures could be overcome. Many comrades proposed that along with production cost legislation, control organs should be set up and perfected at various levels, since reliance on the financial departments alone would not be enough. The planning, economic and capital construction commissions at various levels, and the departments in charge of enterprises should all set up their own organs to be charged with the responsibility for cost control.

6. On learning from foreign experience in production cost control. The comrades at the meeting unanimously agreed on the gratifying results of learning from foreign experience in production cost control after the lifting of a self-imposed blockade. However, in learning from the Soviet Union during the early 1950's, we had to guard against copying mechanically. There is a difference between the socialist and the capitalist systems. The theories and methods of economic management science used in capitalist countries are suitable for the capitalist economic system, and we can only use them for reference. Instead of adopting them wholesale, we should, after learning and digesting them carefully, choose the portions that can be adapted to the realities in our country. Some comrades pointed out that in learning and conducting research on the Western science of management, we should also take our lessons from the experience (including the experience of failure) of the Soviet Union and the East European countries in economic management. Some comrades said that the theories and methods of economic management in foreign countries had developed from lower to higher stages, and that their production cost control was suitable for the development of science and technology (such as electronic computers) and the knowledge and extensive application of mathematics in foreign countries. Many of these developments still remain in textbooks and have not been tried out in practice. To sum up, in learning from or in using a foreign science of production cost control for reference, we should conduct concrete analyses in the light of realities in our country. Schools and research departments can select something from foreign countries for study.

In addition, many heated discussions were conducted at the meeting on the question of the economic character of production costs.

GENERAL

BRIEFS

MINORITY ECONOMIC RESEARCH SOCIETY--Beijing, 3 Dec (XINHUA)--The Chinese Minority Nationality Research Society was inaugurated in Beijing today. The society's major tasks are to follow the party's leadership, strengthen investigations and studies of the economy in minority nationality areas, engage in theoretical exploration, serve socialist economic and cultural construction in minority nationality areas, promote the party's and government's work on minority nationalities and train economic theorists of minority nationalities. Attending the inauguration ceremony were Yu Guangyuan, vice president of the Chinese Academy of Social Sciences, Yang Dongsheng, vice minister of the state nationalities affairs commission, leading members of the NPC nationalities affairs commission and other units and representatives of all nationalities from various provinces, municipalities and autonomous regions totaling more than 120 people. CHINA ENTERPRISE DIRECTORY--"China Directory of Industrial and Commerical Enterprises" [Zhongguo Gongshang Qiye Minglu 0022 0948 1562 0794 0120 2814 0682 6922], China's first voluminous commercial reference book compiled and published by Beijing's XINHUA Publishing House, is opened to subscription in Jiangsu Province. The directory gives the scopes of business, specifications and types of major products, scales and locations of some 10,000 enterprises in industry, transportation, commerce and service trades in China. It will help to promote coordination between producing and marketing units, facilitate commodity exchanges and boost economic development. FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

Research Organization, Management

Beijing MEITAN KEXUE JISHU [COAL SCIENCE AND TECHNOLOGY] No 9, Sep 81 pp 57-58

[Article by Zhong Kecheng [6945 0344 2052] (edited by the staff of this journal): "The Organization and Management of Research in the Coal Industry"]

[Text] In recent years advanced coal-mining nations in the world are very concerned about the organization and management of coal research and treat the subject as a management science in their investigation. Valuable experiences have been generated for each nation's specific situation which should serve as a reference for us.

I. Organization and Work Division in Coal Research

The reorganization format of coal research should emphasize the proper handling of the interrelationship of research, development and production. Research in the coal industry should be approached from a pragmatic point of view, that is, (1) promoting a close relationship between research and production, (2) strengthening the coordination in scientific research, and (3) urging the industry to actively adopt new technologies.

In recent years foreign countries have taken the following effective measures in their research systems:

1. Establish research-production bases. The advantages of the research-production bases are the intimate matching between research and production and the great reduction in research time. For example, the Russian coal industry built a united company specifically devoted to the investigation of the mechanization of mineshaft auxiliary procedures. It is centered around a large scale research institute and the participation of design, development and production departments has reduced the time for developing new facilities by 50 percent. The United States has established even more research-production bases in government research centers, in corporate research institutes and in universities. Joint research is conducted for some highly interdisciplinary topics and large scale experimental facilities and computer centers are shared with high efficiency.

2. Establish research centers. These modern science and technology centers can not only concentrate man-power and resources in solving major problems in science

and technology but also promotes the intimate combination of scientific research and production. Today such centers are established in America, England, Russia, West Germany, Japan, France and Poland. In the United States, 4 research centers under the Bureau of Mines conduct mining research and the safety regulatory departments in the Labor Department also have technical service departments which carry out scientific research on safety. In West Germany, more than 50 percent of coal research projects are conducted jointly by this type of coal research centers and production plants of the coal industry. This kind of research organization effectively promotes the advancement of coal technology.

3. Adopt the contract system. A number of countries have adopted the contract system in improving the quality and efficiency of their coal research. The contract system is most popular in the United States. There are basically two types of contracts: In one type of contract the investment comes entirely from the government and a fixed compensation is usually made to the contractor in addition to the research costs. In the other type of contract both parties entering the contract share the burden of investment. This latter form of contract usually applied to the case where the production unit provides experimental facilities for the research project. A number of research projects are proposed by the research center which also provides the technical requirements and the work is contracted to private enterprises and universities which carry out the design, development, and testing, and present the research results. The job of the research center is mainly overseeing the technical standards and monitoring the execution of the research contract.

II. Organizing Research Plans and Research Projects

All the major coal-producing nations put great emphasis on the compilation of research proposals and plans. The general belief is that to develop coal research there should first be a proper goal and a practical research proposal. In foreign nations there are special institutions devoted to the study of "futurology" and research plans are made using systems engineering.

1. In a practical research project, there should be first a clear understanding of the key issues which have impacts on the development of the coal industry and then a program with well-defined emphases for short term and long term so that efforts can be focused in attacking the problem. It should be realized in planning a program that scientific research must lead the way for production construction whether the topic is key technical problems or long term economic construction.

2. Research plans in the coal industry are generally divided into short-term, mid-term and long-term projects. In England, for example, the plan is based on the projected production needs from 1985 to the year 2000. Short-term plans consider the topics of improved resource recovery and mining technology and the concentrated layout of mineshafts. Mid-term plans deal with the realization of remotely controlled and automated underground shipment and remote control of mining surface equipments. Long-term planning considers exploring the advanced experiences in other industries and transplanting it to the coal industry and topics such as mechanized mining using hydraulic power, broadened application of laser, and underground coal gasification. In any case, the actual contents of a research plan must be based on the specific situation of the nation and should not be forced to be

forced to be uniform. However, the principles of emphasizing short-term and long-term coordination and well-defined major efforts should be followed.

3. Material requirements of the proposed research plans are stressed in all nations. Budget requests are made simultaneously with the submission of the research proposal and the two are closely linked. Work can only be done within the means of funding. A research proposal that has a solid material backing is unlikely to be fruitless.

One important question in organizing a research plan is how to decide the main emphasis of the research. People abroad have considered this question from two standards, the so called internal standard and the external standard. The internal standard refers to the scientific field the topic belongs to and is concerned with questions such as whether the research has technically matured to the stage ready for development and whether the quality and quantity of the researchers engaged in this research are adequate to carry out the research and development tasks. The external standard can be divided into the scientific merit, the technical value and the social value.

All the major coal-producing nations emphasize basic research in their scientific research planning. The close relationships among coal production, processing and utilization and natural environment have been realized. In countries such as the United States and England, the ratio of basic research, applied research and development is roughly 1:2:5. The ai sen [phonetic] research center for coal in West Germany has approximately 1200 employers, out of which more than 1/3 of the employee efforts are in basic research.

While developing basic research, various nations have also realized that research topics should come from production practice. Many of the research topics in West Germany are technical problems in production urgently waiting for solutions. To solve the problem of excessive yield of coal powder in the rolling cylinder coal cutter, they have developed a disk coal cutter that has a powder yield 30 percent lower than that of a rolling cylinder coal cutter of equal power. The new type of coal cutter reduces the yield of grains 10 millimeter in size or smaller by 10 percent and improves the yield of 50 millimeter or larger coal grains by 27 percent.

The formation of an annual research plan should be based on a detailed study of the research topics of the previous year. Modifications should be made to various degree but the overall thrust should not be greatly different from that of the previous years. Plans are usually made every 2 or 3 years to maintain the stability of the research topics.

III. Organization of the Research Force

Excellence of the research team should be stressed and attention should be given to the development of various research forces. For example, special research companies, technical development departments of plants and mines and mining engineering departments of universities and colleges should each make their own contribution and complement each other. Scientific and research personnel specialties should be kept relatively stable and attention should be given to the cultivation and improvement of the research staff. Periodic training should be held for the researchers whether they are engaged in basic research or in technical work in plants and in mines.

International collaboration should be improved. In organizing the research force, we should not only pay attention to the collaboration with departments outside the coal research system but also stress the effective department of foreign research. For instance, the United States is not familiar with technology of long wall mining, so, in addition to their own investigations they have also invited experts from the luer [phonetic] coal technology consulting company in West Germany and from the British mining consulting company to the United States for mine pressure investigation and solved the technical problems of shielded automatic translating carrier.

Experience shows that strengthened international collaboration in technology is an effective means to improve the quality of researchers, to accelerate the development of scientific research and to obtain research results as quickly as possible. It is receiving increased attention in many countries.

IV. Carrying Out the Research Work

The procedures of scientific research should be rigorously adhered to. In general, different procedures of investigation are proposed for the study of different topics. In England, regulations require that the testing of a research prototype must include laboratory tests, surface tests and running at the production site (including underground).

Scientific research funds should be applied in a concentrated manner and funding for major projects should be guaranteed. The funding sources for scientific research in major coal-producing countries are all allocated from the production cost and sale volume of coal, except for government investments in research. Many research institutes are themselves financially accountable enterprise units.

Modern scientific experiment facilities should be built up. A research unit is different from a production plant or a coal mine. It must have a certain amount of laboratory facilities and measurement equipment in order to develop its specialty, to accept experimental and testing assignments that cannot be achieved at the plants and mines and to present convincing scientific data.

Attention should be given to the role played by scientific and technological information. In the days of a rapidly developing coal technology, the role played by information is becoming increasingly prominent in the modernization of technology. Advanced coal-producing nations have already entered the age of "information-computer-telecommunications" and scientific management of technical information. Extensive information and data can be obtained rapidly and accurately. The strong sense of timing has further accelerated the development of research.

A system of periodic checking should be established. For the purpose of discovering problems in time to make rational adjustments to the project, many countries have established a periodic checking system. The coal mining research and development center in England reviews the research topics once every month and the highlight subjects once every week as a rule. Modified schedules are then printed out by the computer and distributed to the staff. Brief summaries are made every quarter and annual reports are submitted to the bureau of coal management for review.

V. Evaluation, Application and Promotion of Research Results

On the review and evaluation of research results, each country has its own strict requirements and rigorous standards. The evaluation is usually carried out by a special committee or an appointed research institute. In England the general bureau for coal management appoints the institute of coal mining and mining machinery design to conduct certification for all the new coal mining machinery in England. Only the certified products are allowed to begin mass production. This institute has very stringent requirements in evaluating the newly developed automatic translating carrier Ziyi Zhijia [5261-4448-2388-2665]. Numerous tests are performed on the components and on the whole machine, and some new carriers went through as many as 20,000 tests. Once certified, the research results should be fully used and promoted. In the United States, research results of the government become the government's patent and there are specific institutions in charge of the promotion and proliferation in industry. The bureau of mines of the U.S. Department of the Interior established special organizations as early as the beginning of the 1970's to promote research results.

In recent years, science and technology of the coal industry in China have progressed steadily and the management of coal research has also gradually established a regular system. With the benefit of foreign experience, it can be anticipated that the future organization and management of research in the coal industry will become increasingly scientific and modernized and new contributions will be made in promoting the science and technology of the coal industry in China.

Economic Problems Studied

Beijing MEITAN KEXUE JISHU [COAL SCIENCE AND TECHNOLOGY] in Chinese No 7, Jul 81 pp 2-4

[Article by special commentator: "Actively Develop the Study of the Economic Problems of Coal"]

[Text] The coal industry is an important sector of our nation's national economy. Since the founding of New China, it has developed greatly, and it has contributed what it should to the building of our nation's socialism. At present, there is already a team of several million workers on the coal industry front. Known coal reserves amount to over 600 billion tons. The state invests heavily in the building of the coal industry each year, and the industry has become one with a relatively large amount of fixed assets and with a productive capability second only to the United States and the Soviet Union, ranking third in the world. Now, how to rationally develop and utilize such rich coal resources, how to rationally utilize such huge manpower, material forces, financial strength and productive capabilities, how to rationally transport, distribute and utilize such massive amounts of coal products, and in general, how to develop their greatest efficiency and achieve their greatest economic results are a series of important economic questions regarding coal which confront us and which we must study.

Developing coal must obey the characteristics of the distribution of coal resources and other economic and geographic conditions. For example, the coal resources in Shanxi are superior to all other regions and the construction cycle for developing coal in Shanxi is short, with less investment per ton of coal being required, equivalent only to 1/2 to 1/4 that of Hunan, Hubei and Zhejiang. The cost of exploiting a ton of coal is lower than the national average by 1/3, and lower than that in Hunan and Hubei and Zhejiang by 1/2 to 1/4. The material labor production rate of the coal miners in Shanxi is twice as high as that of Hunan and Hubei and Zhejiang. But, expanding the development of coal in Shanxi is limited by such natural and socio-economic factors as the regional economy, labor force, water resources, and conditions of transportation, etc. As Marx pointed out, the labor production rate is always linked to various natural conditions. "True wealth is to use the least amount of labor and time to create the most material wealth." Therefore, according to coal resources and different socio-economic conditions, studying the use of the same amount of labor (live labor and embodied labor) to obtain more utilization value and to reach the best economic results is one of the important tasks of studying the economics of coal.

But, for a long time, under the guidance and influence of the mistaken leftist ideology, development of the coal industry did not sufficiently follow the situation in our nation, it did not sufficiently follow the objective patterns of the coal industry itself, it was anxious for achievements in its guiding policy, it blindly sought high goals, and development of the coal industry was hindered. Especially during the ten years of the "cultural revolution," the coal industry suffered from serious interference, the leading group, the technical teams, the workers' ideology, the productive conditions, business management, regulations and systems were all severely destroyed. In particular, the imbalanced internal proportions of the coal mines worsened, safety conditions were poor, the loss of coal resources was great, wastefulness in capital construction was serious, the proper procedures of capital construction were violated, and the preparatory work of the early period was neglected. Frequently, projects were started hastily and carried out without preparation, and with the addition of poor management, the economic results were poor. In addition, the price of coal remained unreasonable for a long period, violating the laws of value. Problems of not adhering to the principle of distribution according to work existed in the wages and labor system. The production, supply and marketing system and the management system were not well matched, etc. All these affected the hastened development of the coal industry. These problems show that we have not yet recognized clearly the laws of motion in the economic sector of the coal industry, and this is mainly because we have not launched the study of the economic problems of coal well.

Yet, the important significance of understanding clearly the economic problems of coal in developing the coal industry has not yet been recognized by even more comrades. We believe, for the coal industry to realize modernization, the modernization of technical equipment, the modernization of economic management and high levels of economic results are all important signs.

Obviously, with modernization of coal technology and equipment but with backward economic management, the economic results will be very poor, and we cannot say that the coal industry has truly realized modernization. Technology and economics are mutually stimulating, mutually dependent and mutually limiting. Science and technology serve economic buildup. They are "powerful levers" to stimulate economic development. What the economy needs is a technologically advanced motive force and direction. Technological progress is in turn the important condition and means to push economic development forward. Any technological reform and the realization of technological measures are all inseparable from economic conditions. Similarly, an economy unrelated to science and technology cannot exist. Under all conditions, people must use definite technology to achieve a definite goal and to satisfy a definite need. The social practice of any technology must consume manpower, material force and financial force under all conditions, and it must combine man, materials and technology as well as possible under a definite environment to develop their functions to the maximum extent. A lot of advanced technology frequently produces a very good economic result, but, because of the influence of various internal and external factors, technology and economy frequently possess the mutually limiting side of opposing each other and conflicting with each other. For example, under certain conditions, the technology may be advanced, but the economic results are not good. This limits the development of this type of technology. It can thus be seen, seeking the objective patterns of the rational relationship between technology and the economy and finding the best relationship so that technology and economics can mutually adapt to each other well is precisely the major problem of the economy of coal we want to study. Therefore, to promote the development of coal science and technology and to realize modernization of the coal industry, the development of the study of the problems of the economics of coal is needed even more.

The subject and the goal of studying the economics of coal should be a discussion of the link between the reproductive process of coal and economic problems, and we should take the economic effects and economic management problems in the process of reproduction of coal as the subjects. Coal economics, that is, coal technical economics, is the study of the economic questions of coal production and productivity, while coal economic management is the study of how to rationally organize the productivity of the coal industry, ceaselessly perfecting the economic relations of the coal industry (productive relationships), readjusting the superstructure's timeliness (such as the set up, plans, system, pricing policies, etc.) to suit the needs of development of the productivity of coal. Therefore, to study the economic problems of coal is to study the objective laws of the reproductive process of coal from the economic viewpoint, and using this law to form the best combination between the appropriateness of technology of the reproductive process of coal and the rationality of economics. For this, the task of studying the problem of the economy of coal is to show the economic patterns in the reproductive process of coal, to determine the plans to increase the productive efficiency of coal, to select the best economic results in productive construction, to improve the organization and plans for production, to point out the direction and the path to hasten the development of production, to make decisions to develop the coal industry and to provide a basis for establishing the most suitable technical and economic policies and management systems and to propose theory and methods to study the economics of coal.

We believe the content of studying the economic problems of coal is very broad. We must grasp the key points, emphasize the urgent problems that we face at present in our studies, and we must also consider the need to develop sectoral economics and to carry out overall research according to plans.

First, we should study the concrete theories and scientific methods of economic problems of coal. This should not be neglected. Because, without the guidance of basic theories and scientific methods, other research will not have anything to follow, and it would be difficult to judge their scientific nature and their correctness. The theory and method of studying the economic problems of coal must be guided by the general economic theory of Marxism, to absorb the advanced theory related to sectoral economics abroad and at home, and combine the concrete conditions and characteristics of our nation's coal industry, conscientiously summarize the social practices in the coal industry of 31 years, and to seek out the useful theories and methods from the valuable experiences, both positive and negative.

Second, to study the economics of coal resources, we must mainly study the socioeconomic uses and the technical and economic effects of coal resources. For example: 1. the regional distribution of coal resources and the geo-economic distribution of coal resources, the forecasting of trends and needs for coal resources; 2. economic zoning of coal resources; 3. technical and economic evaluation of coal resources, i.e., to analyze, prove and evaluate the feasibility from the technical and economic viewpoints the usability and ways to utilize coal resources; 4. to explore the value of coal resources in economic theory and the problem of compensatory use, etc.

Third, the development of the economic study of coal technology should emphasize the problem of economic results in the buildup of coal production. This should be the core of studying the economic problems of coal. We must not only study its nature, the system of indicators of economic effects, and the methods of evaluation and calculation, we must also carry out qualitative and quantitative comparison according to scientific regulation in considering concrete problems, determine various technical plans, technical measures and technical policies and their optimization. The subject of the economic problems of coal technology includes many areas, for example: 1. the rational development and distribution of coal resources, i.e., under different conditions, which technical method of development is rational, how to overcome the uneven distribution of the resources and how to effectively develop the desired effects of distribution, how large should the scale be to be economical, what type of wells and what intensity of development and how many years of service would be economical, policies that rationally develop regional coal mines; 2. the study of the effectiveness of investment in capital construction of coal enterprises, including the system of indicators and goals, and the methods of evaluation; 3. the problems in coal production, such as the rational utilization of productivity, the pattern of balanced production and the rational policy of digging for potential, renovation and reform, the rational criteria for the retrieval of coal resources, the ways to increase the labor production rate, etc.; 4. the rational scope of coal processing and washing, the rational structure of products, the rational utilization and comprehensive utilization of coal; 5. the policy questions concerning the development of coal science and technology, for example, whether to develop suitable technology or advanced technology, whether to rely on oneself or to introduce foreign technology, how to adapt introduced technology to our national situation and how can we adapt to the trend of international development, thus hastening the development of coal production in our nation and promoting the development of technology; 6. the study of how to correctly handle direct results and indirect results, immediate results and long term results, the relationship between macroeconomic results and microeconomic results, etc.

Fourth, research in economic management of coal should be carried out. The problems that need to be studied in this regard are broad, mainly problems of business management for coal, the system of economic management, the internal and external economic relationship and the series of economic policies. For example, the policy of protection and utilization of coal resources, the problems of the structure and the management system of coal, the rational system for production, supply and marketing, how to use economic methods to manage the economy of coal, the problems of the export of coal and foreign trade systems for coal, the analytic study of the production costs of coal, the ways to reduce cost, rational labor, wage and welfare policies for coal mines, coal pricing policies and other economic policies, the source and rational utilization of capital for buildup of coal, the policy of international cooperation and joint management, the relationship between the development of the coal industry and science, education and environmental protection, the rational economic relationship between the coal industry and other related sectors of the national economy, and the future for developing coal as the main energy resource and as industrial raw materials, etc.

If the above problems are studied clearly and their patterns grasped, then there will be freedom in managing the coal industry well.

At present, the study of the economic problems of coal is a very important and mighty strategic task. It relates to the future development of the coal industry. Therefore, we must organize our forces well to actively begin research. At present, we should organize appropriate forces in the departments of scientific research, design, geology and various economic management departments and concerned schools, and we should rely on scientific research forces in society, combine their efforts with actual problems, start out by studying specific topics, and after obtaining some results, we must first compile collected works on special topics in the economic research of coal, and on the basis of further systematic study, gradually form a more complete coal economics, then further enrich and improve it. For this, we must have a broad number of people willing to serve as scientific, technological and managerial cadres to widely carry out research, and we must also organize specialized teams to carry out systematic and in-depth research.

The characteristics and demands of research in the economics of coal are different from those in the research of coal technology. To the researcher, he is required to understand technology and also understand economics, the knowledge must be broader, and he must possess the ability to analyze and synthesize. This requires selecting a backbone team from cadres with scientific and technological and managerial experience, and at the same time to provide them with other necessary specialized personnel to carry out research together. In the method of research, the economic research of coal must emphasize investigative research and analysis, comparison and computation.

The other characteristic of economic research of coal is the wide scope and its involvement with the current system and policies of the state and the sector. Economic research is not the proving and the explanation of current policies. It must start out from the actual situation, it must start the engines, conscientiously study, speak the truth, judge by seeking truth from facts and judge scientifically, say whatever comes to mind, have the courage to propose opinions and suggestions of a policy nature having a scientific basis, and contribute towards the realization of modernization with one's own scientific research achievements.

At present, in the development of research in the economy of coal, although there still are some difficulties, for example: a few comrades do not have sufficient understanding and do not place sufficient emphasis on it, the research strength is weak, the organization and agencies are not sufficiently sound, basic work is poor, information is deficient, there is a lack of mature theory and method, etc., but now, there are many beneficial conditions, the party and the state emphasize economic research, there are some economic research agencies that have been established one after the other, such as the National Technology and Economic Research Center, which is the authoritative information and consulting organ on national policies concerned with technology and economic policy. The state has also gradually established some systems to promote the emphasis on economic research. The leadership of the coal ministry has emphasized research in the economy of coal, and recently, it has proposed concrete tasks to the scientific and technical departments to study and establish Chinese coal economics. In addition, the social practices of 30 years by the coal industry have accumulated rich positive and negative experience which can be utilized. The broad numbers of scientific and technical and managerial cadres are enthusiastically concerned with research in the economy of coal, and they have a great enthusiasm. Now, the key is to organize the forces. As long as we act and persist, we will definitely be able to develop research work in the economy of coal, gradually understand clearly the important economic problems facing us, grasp the patterns of the economy of coal in China, and promote the modernized buildup of the coal industry.

Symposium on Coal Utilization

Beijing MEITAN XUEBAO [JOURNAL OF CHINA COAL SOCIETY] in Chinese No 2, 1981 pp 67-68

[Article by Hang Jinhe [2799 6855 0735]: "Brief Report on the Symposium on Rational Coal Utilization"]

[Text] The China Coal Society, the China Metals Society, the China Chemical Engineering Society, the China Environmental Sciences Society and the Beijing Energy Society held a "Rational Coal Utilization Symposium" from 7 to 13 January 1981 in Changsha, Hunan. Some 150 specialists, professors and engineering and technical personnel involved in coal processing, metallurgy, chemical engineering, combustion engineering, environmental sciences and energy resources technical and economic research from all over the country participated. A total of 75 papers and reports were received. Their contents included: The country's basic coal production and utilization situation; rational utilization of refining coke and metallurgical conservation; new developmental research on coal gasification and liquification and mixed combustion of coal and gas; low caloric content coal combustion techniques and residue utilization; conservation of coal for use by the public; and the development of shaped locomotive fuels and the effects of coal processing and utilization on environmental pollution and environmental protection.

An extensive discussion of techniques and approaches for rational coal utilization was conducted at the conference, and it was concluded that rational coal utilization is a highly integrated scientific-technical and economic-mangement undertaking which includes such problems as production and supply of coal, its processing and utilization, human livelihood, and environmental protection. Performing effectively the work described below in keeping with our country's specific conditions will be an important approach to rational coal utilization.

1. It is necessary to intensify screening and classifying, increase the number of varieties, improve quality, improve the coal product structure, and rationally adjust coal prices. Many representatives pointed out that much industrial equipment which uses coal as a fuel or raw material has specific technical requirements regarding coal quality, and if the coal mines provide varieties of coal suited to the charcteristics of this industrial equipment it will be possible to get full efficiency from it and to achieve outstanding conservation results. It was suggested that the coal production departments should make an effort in this direction and create favorable conditions for coal conservation.

2. The coking industry should be steadily developed in a planned fashion. Setting up joint coking and chemical engineering enterprises in coke-producing mining districts for the purpose of producing various types of coke, municipal coal gas and chemical engineering products is an important way of making rational use of coal. It was suggested that certain local coke producing facilities which waste rather large amounts of coking coal should convert as rapidly as possible to mechanized coking so as to save coal and protect the environment.

3. We should promote actively the use of the blown coal powder technique in blast furnaces. This is an effective way of saving coal in the metallurgical industry, but to extend the use of this technology it is necessary to solve the problem of declining coal powder quality. It was suggested that the metallurgical departments propose quality requirements for coal powder to be used in this technology and that the coal departments set up the requisite classifying and screening plants.

4. An energetic effort should be made to fix the supply of coal for coal-fired electric power stations in terms of quality and amount. Electric power stations may efficiently burn low caloric value coal, but the quality of the coal supplied must be stable to assure normal boiler operation. If this work can be done, a 3 percent economic effect can be realized in coal conservation.

5. This country produces large quantities of low caloric-value coal, including brown coal, coal washings and gangue, which should be used locally in accordance with local conditions, in an effective manner. In addition to using its heat content, effective comprehensive utilization of coal ash and cinders must be achieved; use of coal ash in concrete and other building materials is an important method which should be energetically popularized. This is the key to economical utilization of low caloric-value fuel.

6. Developmental research on new coal conversion technologies such as gasification and liquification must be pursued. Liquification and gasification have the advantages of improving the coal's caloric content and overall utilization efficiency, ease of concentration which solves environmental pollution problems, alleviation of the load on transport facilities, and adding to the supply of fluid fuels and chemical

engineering raw materials. At present, not only must there be no slackening of scientific research work in this area, but an energetic effort must be made with modern techniques. Because the research period for coal conversion technology is rather long, it is suggested that arrangements for this kind of scientific research work be made well in advance.

7. Developing formed fuels is an important approach to efficient utilization of coal by the populace. In recent years, our country has had great achievements in the development of honeycomb briquets, and it is suggested that this technology be energetically popularized. The development of municipal coal gas should be gradually pursued in keeping with the nature of coal reserves and the needs of municipal construction. The technical approach should not be limited to a single method: Several programs should be compared and the most economical and efficient process selected.

8. A contingent should quickly be organized to pursue work on coal combustion technology. More than 80 percent of the coal produced in this country is used as fuel, but scientific research work in this area has not yet been organized, so that many problems such as low combustion efficiency and serious pollution have not been resolved; it was suggested that scientific research in these areas be quickly pursued.

9. Sufficient attention should be devoted to environmental pollution resulting from the use of coal, and early prevention and treatment measures taken. Many repreentatives pointed out that coal is the greatest pollution source in our country at present, and all of the various links in the coal production process and all coal processing methods lead to environmental pollution, so that environmental evaluations should be made of all the main enterprises making concentrated use of coal, and early protection and treatment measures should be taken to avoid grave consequences.

10. Technical and economic studies of coal utilization should be undertaken. The conference participants concluded that efficient utilization of coal involves not only technical questions but many economic and management questions. While pursuing technical and economic studies on energy sources, we must effectively link technology and economics, respect science, seek the truth from the actual situation, take a prudent approach and avoid one-sidedness. In view of the fact that technical and economic research on energy resources in this country are still weak, it is suggested that this type of scientific research work by strengthened in the future.

The participants all concluded that because rational coal utilization affects many departments, it is extremely necessary that various scientists and experts be invited to discuss problems of common concern. Many representatives believe that such a multidisciplinary conference is a rather effective professional activity and suggested that such conferences be held regularly in the future.

Rational Use Studied

Beijing RENMIN RIBAO in Chinese 28 Jul 81 p 3

[Article by Xie Xiaowen [6200 2556 2429] of the Planning and Design Institute of the Ministry of Coal Industry: "Use Coal Rationally"]

[Text] In terms of the technological standard of today's world, it is a big waste to use coal just as a fuel. Only when coal is used in an integrated fashion, where it is used as a thermal energy source as well as a chemical and metallurgical industrial material, can one say that it is fully used. Scientists have made the following comparison: if the value of using coal as a fuel is taken to be 1, then the value is 10 when coal is processed into coal tar, the value will be 90 if processed into plastics, 375 if synthesized into dye and 1,500 when synthesized into fiber. Therefore, all countries in the world are studying the rational use of coal.

China has abundant coal resources, it has a large coal reserve, a broad distribution and a complete variety, and the production volume is high. Although quite a few achievements have been made in the rational use of coal, there still remain a number of problems. For example, great amounts of coking coal are burned as non-coking coal, primitive coking methods are greatly promoted, coal utilization rates in both the industrial and civilian sectors are too low, quality of the produced coal is poor, utilization efficiency cannot be improved, and smokeless coal and brown coal have not achieved effective utilization.

It can be seen that there is great potential to be developed in China's coal utilization. Take the case of brown coal. It has a moisture content as high as 30 to 40 percent and a calorie value of only 2,000 to 3,000 kilocalories per kilogram, and has long been regarded as a low grade coal and received little attention. But, in fact, it is only necessary to first make brown coal into low calorie value coal gas and then generate electricity with the composite combustion gas-steam cycle for the thermal efficiency to reach 40 to 45 percent, twice the average thermal efficiency of today's coal power plants in China. Furthermore, when coal gas is piped into the cities for industrial and civilian use, it saves more than 50 percent of coal as compared to burning honeycomb coal. In addition, brown coal is a good material for coal gasification. When gasified in-situ, it not only produces high calorie value fuel with low ash and sulphur content, but also produces high grade material for coking, carbon material and carbon fiber, depending on the operating conditions. It can also be used as boiler fuel or further hydrogenated to produce high grade gasoline and other valuable chemicals. With advanced scientific technology for rational use of coal, even low grade coals are valuable, not to mention high grade coals.

In order to achieve rational use of coal in China, the previous development policy based on coking coal should be adjusted. Brown coal and non-coking coal, which are suitable for open pit mining, should be given priorities. This will not only rapidly increase the production of non-coking coal and brown coal, it will also provide a material basis for the rational use of various kinds of coal.

Next, dressing of all the raw coal should be systematically and gradually achieved to improve coal quality. Matching and distribution of production and demand should be made to satisfy the needs of different consumers to improve the utilization rate of coal.

Finally, scientific research should be strengthened to improve the technology of coal utilization and gradually achieve the conversion of coal into a secondary energy source and greatly improve the industrial and civilian heat energy utilization rate. That is, based on the different coal resource conditions at various places, united enterprises of electric power generation, coking, coal gas and coal gasification should be develcped according to the location to achieve a truly rational use of coal.

Coal-Oil Mixed Fuel

Beijing RENMIN RIBAO in Chinese 28 Jul 81 p 3

[Article by Ma Yuanji [7456 0337 7535] of the Physics Department of Zhejiang University: "Attention Should Be Paid to Mixed Fuels"]

[Text] Since the 1970's, because of the oil crises many nations have once again put the utilization of coal in an important position and actively searched for ways to substitute oil by coal. One of the new technologies developed in recent years is that of coal-oil mixed fuel, which is an effective transitional measure from oil to coal.

The so-called oil-coal mixed fuel is obtained by adding 20 to 45 percent of fine coal dust into the fuel oil, then homogenize it to a mud-like mixture. It can be used in fuel oil devices such as oil-burning boilers, blast furnaces, smelting furnaces and heating furnaces. When mixed fuel is used in oil-burning furnaces, it generally reduced the fuel oil consumption by 20 to 25 percent, and there is basically no need to modify the structure and size of the boiler. This has opened up the road toward substituting coal for oil. With a brief down-time and a small investment, equipment modifications can be easily made without affecting the output and efficiency and the original oil-burning system and storage facility can be used as well.

In recent years many industrially developed nations have put great efforts into research on coal-oil mixed fuels. Three international meetings were held since 1976 for technical exchange of mixed fuel technology. Today, mixed fuel technology has advanced to the experimental stage of broadening the application in large boilers and blast furnaces.

In China the experimental research of mixed fuel is already underway. Since 1979, the Chinese Academy of Sciences, Zhejiang University, Qinghua University and Yangshupu Power Plant in Shanghai have all obtained results in the investigation of the properties, manufacture process, transport and storage of coal-oil mixed fuel and presented technical papers in international coal-oil mixed fuel technology exchange meetings held in 1980 and 1981. Now the laboratory research has been completed, and intermediate tests will be conducted. The success of coal-oil mixed fuel technology can be expected.

Mine Flooding Prevention

Beijing GUANGMING RIBAO in Chinese 27 Oct 81 p 2

[Article by Wu Zongze [0702 1350 3419] and Li Linhe [2621 2651 3109]: "Strengthen Mine Flooding Prevention"]

[Text] A national conference on mine flooding was held early September in Jiaozuo Municipality. Experts attending the conference unanimously urged improvements in the prevention of mine flooding.

The hydrogeological structures of coal seams in China are complex and underground water often appears in mine shafts. As the depth of digging gradually increases, the flooding problem has become more serious and is now an outstanding obstacle to China's coal production and a threat to the workers in the safe production of coal.

The conference was centered around the topic of flood prevention in mine shafts and in-depth investigations were conducted from different aspects.

Experts believe that the primary requirement for the prevention of mine flooding is a thorough investigation of the hydrogeological conditions of the area. This is an elaborate task and can only be carried out properly with the collaboration of survey, production, research and education departments. To this end they recommended that the State Planning Commission, the Sate Energy Commission, the State Scientific and Technological Commission and the Ministry of Coal Industry include the prevention of mine flooding into their long term and annual plans, give it unified and overall consideration and planning and complete this task together. In the meantime, establish a national organization, round up specialists, form a task force and conduct investigation of common problems on a typical mine area with major water problem, then, summarize the experience gained in the study to advise the flood prevention work in other mining areas.

The experts also suggested the Mnistry of Coal Industry and its associated colleges and universities to add hydrogeology and production geology specialties, provide training for existing personnel and fundamentally change the serious shortage of mine shaft flood prevention specialists in China.

Losses During Shipment

Beijing RENMIN RIBAO in Chinese 14 Sep 81 p 2

[Article: "Alarming Loss of Coal During Shipment"]

[Text] The loss of coal in China during shipment is extremely serious. According to reports from Jiangsu, Zhejiang and Guangdong provinces, the loss of coal during shipment by railroad has uniformly gone up. The loss rate in recent years is generally in the 1.35 to 10 percent range with an average of 4 to 5 percent. Based on a 4.8 percent loss, the total annual loss of railroad transported coal in 1979 and in 1980 both exceeded 20 million tons. In an article entitled "Railway coal cart" published in the August 1980 issue of the Railroad Technology News magazine, it was pointed out that the loss rate of transporting coal in open railroad cars is 3 to 4 percent and in some cases, as high as 5 percent. Using the 3 percent figure, the annual loss is 15 to 18 million tons. According to data from Guangdong and Zhejiang provinces, the loss of coal in the transportation by waterways is 3.85 to 12.15 percent. For one shipment of coal from Guizhou Province to Jiangsu Province by a waterway-railway combination, the loss was as high as 20 percent. If we take the average loss in waterway shipment as 6.7 percent, the annual coal loss in the past two years has exceeded 2 million tons.

The principal causes for the high rate of loss during shipment are the following:

In the shipment by railway the foremost problem is the serious damages of railroad vehicles. According to a survey made a few years ago by officials of the Beijing Railways Society, as many as 70 percent of the open railroad cars are faulty. Although there have been some improvements in recent years, the percentage is still alarmingly high. In September 1979, the Ministry of Coal Industry made a month-long statistical survey at 72 uniform allocation mines and found that 29.24 percent of the railways carts entering the mines are handicapped by holes in the sides, missing doors, missing side panels and incomplete door latch parts; 41.41 percent of vehicles do not conform to specification. A total of 1.8 million train-times of broken and damaged vehicles entered the uniform allocation mines in China for one year, the figure is even higher when the nonuniform allocation mines are also counted. After these broken and damaged vehicles enter the coal mine, the holes need to be repaired and it takes great amounts of wood board, bamboo, straw, reed, straw and bamboo curtain, and wooden post. The coal mines in China suffer a loss of 50 million yuan per year on this item alone. Because so many vehicles are damaged or broken, there are still tremendous losses due to leakages in the shipment. Then there is the problem of poor management by the railroad. Some of the personnel at railroad stations take coal from the vehicles at will and some peasants near the station dig coal from the carts any way they can, then fail to plug up the holes, which causes coal to leak out all along the way.

The principal causes of the loss of coal transported through the waterways are as follows. First, the method of pushing staggered barges is being promoted for transportation on the Changjiang. Because there are frequent seasonal winds on the broad river surface, an average of 200 to 300 tons of river water will enter a 1000-ton coal barge. Upon arrival at Shanghai harbor, unloading cannot be done because of the water, which must be pumped out first. In pumping out the barge, small grains of coal are pumped into the river together with the water. Second, in the loading and unloading operations at the sea port and at the relay and reception coal harbors, large quantities of coal are also dumped into the water because of defective loading and unloading machinery and problems in the operation. When we were at the coal wharves in zones 6 and 7 of the Shanghai harbor, we saw some small fishing boats in Huangpu Jiang surrounding the collier and collecting the coal which fell into the river. From data collected at the site, a small fishing boat can collect 1.5 to 2 tons of coal per day. The Shanghai Coal Construction Company has retrieved 10,000 tons of coal that fell into the river in one year. It should be pointed out that the amount of coal collected by small fishing boats is a small fraction; most of the coal that fell into the river was either swept away or settled to the bottom.

Energy resources are in short supply in China. Quality assurance of the transportation of coal energy resources and reduction of shipment loss are urgent current issues to be addressed and they are the principal energy conservation tasks of the nation that should not be neglected. Naturally the problem in coal transportation are very involved and their solution will require a certain process. Our recommendation of the administration of the nation is to conduct special meetings to understand the existing problems in this area, establish practical and workable methods and regulations and take forceful measures to gradually reduce the loss rate in shipment.

Efficient Coal Heater

Beijing BEIJING RIBAO in Chinese 15 Sep 81 p 1

[Article by Peng Shuyun [1756 3219 0061] and Zhou Huiping [0719 1920 1627]: "Cheaper, More Efficient Coal Heater To Be Mass Produced"]

[Text] Yesterday the new model 81-4 coal heater was certified and approved for mass production by the supervising departments. This new coal heater is economic in coal usage, efficient in heating, low on smoke and coal gas, fast in starting, long on banked burning and esthetic in appearance.

At the present time, residents of Beijing generally use the so called "dual-purpose heater" for their cooking and heating. This type of furnace uses less coal than the honeycomb coal burner but it still consumes a fair amount of coal and it has the drawbacks of having a tendency to die out, and generating an excessive amount of ash and a high content of coal gas. In order to solve these problems, the science committee of Haidian Ward has made the development of a new coal furnace one of the principal items of its 1981 science and technology project and organized a new coal furnace task force consisting of 8 technical personnel from the Ganjiakou community union, the ward office for coal management and the ward bureau for environmental protection. They opened up their work under the guidance of two advisors, Wang Fengwu [3769 7364 2976] and Xie Yuebin [6200 1471 1755]. In the process of developing the new heater, they incorporated the advantages of the "coal-saving multiple-purpose heater" developed by Xie Yuebin and finally developed the new model 81-4 heater.

Scientific tests show that with banked fire this new type of coal heater produces 50 percent less carbon monoxide in the smoke flue and in the room as compared to the dual-purpose coal heater, the content is even less when the fire is high. The amount of heat released indoors is higher than that of a honeycomb coal furnace and is close to that of a briquet coal burner. It saves 33 percent of the coal. The fire starts fast and the burning time of a banked fire is long; a lump of coal can be banked for as long as 24 hours. It keeps the room ash-free, clean, and sanitary, since a small drawer installed at the opening of the heater collects the ashes and can be removed for dumping. It has a pleasing and esthetic appearance--it looks similar to a small nightstand, and its exterior is painted with various colors of fire-resisting cured paint.

At the present time, because the heater is still being handmade, they are sold at a relatively high price of 35 yuan. With mechanized mass production, the price can be reduced to 10 yuan per unit. These new heaters can be bought at the Tiantan exhibition.

Taiyuan Coal Gasification

Taiyuan SHANXI RIBAO in Chinese 21 Aug 81 p 1

[Article by Zhan Fuquo [2069 1381 0948], Zhou Enying [0719 1869 5391] and Gong Qui [7895 6311]: "Coal Gasification Stressed in Taiyuan"]

[Text] The first meeting of the board of directors of the Taiyuan Coal Gasification Company, jointly administered by the Ministry of Coal Industry and the Shanxi Province people's government, was recently held in Taiyuan; at the meeting, the code of the Taiyuan Coal Gasification Company was passed and matters regarding the earliest possible accomplishment of coal gasification in Taiyuan were investigated together.

In late April 1981, based on directives from the Communist Party Central Committee and leading comrades of the State Council, the State Council approved the joint administration of the Taiyuan Coal Gasification Company by the Ministry of Coal Industry and the Shanxi Province people's government. On 18 and 19 August, the board of directors of the Taiyuan Coal Gasification Company held its first general meeting. Present at the meeting were chairman of the board Yue Weifan [1471 4850 5672] (deputy governor of Shanxi Province), first vice chairman Kong Xun [1313 8113] (deputy minister in the Ministry of Coal Industry), vice chairmen Jiao Zhijie [3542 1807 2638] (deputy director of the Shanxi Province Planning Committee), Yang Zhan [2799 1455] (director of the local bureau of the Ministry of Coal Industry), and Gao Yacai "7559 0068 2624] (director of the Shanxi Province Coal Management Bureau), and board members Zhang Mingli [1728 2494 3810] (chief of the Planning Department of the Ministry of Coal Industry), Wu Jing [0702 0079] (deputy director-general of the Chinese Energy Resource Research Commission and vice chairman of the Technical Committee of the Ministry of Coal Industry), Liu Congzhou [0491 1783 0719] (deputy director of the Shanxi Province Urban Construction Bureau), Cheng Jianfu [2052 1696 4099] (deputy director of the Shanxi Province Chemical Bureau), Shen Zhong [3088 6850] (vice chairman of the Taiyuan Municipal Revolutionary Committee) and Bai Kai [4101 0418] (director of the Taiyuan Municipal Metallurgy Coal Industry Bureau). Board members Jia Songming [6328 1529 2494] (deputy director of the Planning Institute of the Ministry of Coal Industry) and Wang Zeren [3769 3419 0088] (deputy chief of the Finance Department of the Ministry of Coal Industry) were absent because of other businesses.

After thorough deliberation, the company code of the Taiyuan Coal Gasification Company was passed at the general meeting of the board of directors.

Governor Luo Guibo [5012 6311 3134] of Shanxi Province attended and addressed the meeting. He emphasized that coal gasification is a major event to which the vast ranks of people of Taiyuan municipality have looked forward for many years. In the past this wish was not realized for various reasons, and the people of Taiyuan have opinions about this. In last year's government work report presented at the provincial people's congress, the question of the coal gasification of Taiyuan was specifically mentioned. The party Central Committee and the Sate Council are deeply concerned about, and support, the coal gasification of Taiyuan and directed the Ministry of Coal Industry and the Shanxi Province people's government to manage the project jointly. With strong support from the party Central Committee and the State Council and with the collaboration of the Ministry of Coal Industry, we are determined and confident that this beneficial endeavor will be accomplished as soon as possible.

During the meeting, comrades attending the board meeting also visited and inspected the Taiyuan coal gasification plant construction. They all indicated that they would work toward the realization of coal gasification in Taiyuan with the greatest determination, adopt the optimum proposal and actively overcome the difficulties.

Shibaogou Mining Method Improvements

Taiyuan SHANXI RIBAO in Chinese 25 Jul 81 p 2

[Article by Wang Xianbin [3769 2009 2430] and Ren Fuxing [0117 1788 5881]: "Shibaogou Mine Improves Mining Method, Extends Mine Life and Increases Recovery Percentage"]

[Text] "The precious coal resources are not regenerative. We will be committing a crime against the nation and later generations if we do not improve the old mining method." These words were spoken to the reporter by party committee secretary Li Hua [2621 5478] of the Shibaogou coal mine in Xinxian Prefecture. Since June 1980, the Shibaogou mine has improved the old mining method, raised the coal recovery percentage and extended the life of mine shafts that are almost exhausted.

The Shibaogou coal mine was developed from small coal pits. In the past, using the old mining method, the waste of coal resources was serious and the life of the mines was shortened. With backward mining methods, the amount of ineffective footage was high, which in turn caused problems between recovery and digging and often led to the passive situation of stopping the recovery while waiting for the digging.

After the Third Plenum of the 11th Party Central Committee, the Shibaogou coal mine party committee held a number of meetings and urged the workers and cadres to obtain detailed data on two items. The first item was the loss of resources. From 1953 to 1979, the resource recovery rate of Shibaogou mine remained in the 20-percent range, that is, 4 tons of coal were wasted for each ton of coal recovered. The second item was the number of years of service of the coal mines. Robbing in the past shortened the mine life by 30 years. If the old method of mining to the stumps had been continued for another 15 years, nothing would have been left. If the national requirement of 75-percent recovery can be reached by improving the mining methods, the mine life will be extended for another 50 years. By going through and comparing the figures in detail, all the cadres and workers deeply realized that mining method improvement was urgent and imminent. This was reassuring to people.

After their understanding was improved, workers at Shibaogou mine first made material preparations and organized learning and training at nearby mines for 20 key members of the technical staff. With the enthusiastic support of peer units, it took only 1 month for them to grasp the basic operation procedures of the various steps in long wall substrate mining using a metal screen false ceiling. Test mining was subsequently conducted. Today, the three principal coal seams, numbers 2, 3 and 5, are all using the regular long wall mining method with the aid of metallic props. The recovery percentage from January to May 1981 reached 69.2 percent, a 39.6-percent increase over the same period last year. The long wall mining surface also eliminated accidental death in the past year.

Jincheng Mining Bureau Achievements

Taiyuan SHANXI RIBAO in Chinese 5 Aug 81 p 1

[Article by Zhang Qiyuan [1728 0796 0626]: "Jincheng Mining Bureau Now Ranks Among Country's Best"]

[Text] After putting the distribution according to work policy on a solid basis, deploying a variety of economic responsibility systems and making a great effort for mechanized mining, the Jincheng Mining Bureau, an important base of smokeless coal production of China, achieved an all-personnel efficiency of 1.781 tons and 87.49 percent of mechanized mining in the first 6 months of 1981, equalling or surpassing the advanced level of coal mines in the country. In the first half of 1981, the raw coal output of Jincheng Mining Bureau exceeded the national quota by 200,000 tons, 41.3 percent of the mining at the bureau was mechanized, 64.1 percent of the contract profit payments to the nation for the entire year 1981 have already been made, and advance footage overfulfills the national quota by 1,800 meters.

In 1981, party organizations of Jincheng Mining Bureau at various levels put the distribution according to work policy on a solid basis, established a number of economic responsibility systems and a cadre assignment responsibility system, and divided the eight national economic and technical targets into some 30 subtargets and assigned them to the staff and workers. In the meantime, they also made further improvements in the piecework system. Indicators such as material consumption and engineering quality were made part of the evaluation of mining tasks according to piecework on the first line. In addition, national and labor contract systems were implemented in auxiliary units. Various units also took active measures to control overtime and nonproductive labor and obtained noticeable results. In the first 5 months of 1981, the bureau's nonproductive labor decreased by 53.6 percent and overtime labor decreased 21.9 percent as compared to the same period in 1980. The work time utilization rate of the first-line miners generally improved by about 1 hour over last year. From January to May, the bureau saved a total of 379,000 yuan in material costs and reduced the cost per ton of coal to 0.5 yuan below the national target. In the first 6 months of 1981, the consumption of mine shaft lumber in the bureau decreased by 35.31 cubic meters per million tons over the same period of last year and set the best record of the bureau. The accidental death rate per million tons of coal decreased 0.9 percent, and major and minor injury incidents decreased 28.27 percent and 17.3 percent respectively as compared to the same period of 1980.

Commune, Brigade Production Cooperation

Taiyuan SHANXI RIBAO in Chinese 21 Aug 81 p 1

[Article by Rong Changqian [2051 2490 6197] and Jia Yanming [6328 3508 2494]: "Commune and Brigade Coal Mines Continue To Increase Production"]

[Text] In 1981, the commune and brigade coal mines in Shanxi insisted on the policy of unified planning, rational layout, reorganization and progressive improvement, and the production got better every month. On the basis of a 32-percent production increase last year over that of the year before, a new record has been set. As of the end of July, the commune and brigade coal mines in Shanxi have produced 19.867 million tons of raw coal and completed 65 percent of the year's quota, an increase of 22 percent over the same period last year.

Shanxi has a rich resource and a complete variety of coal. The geological conditions are good and the coal is easy to mine. The vast population of peasants are historically used to mining coal and the nation's four modernizations are in urgent need of coal. Since the Third Plenum of the 11th Party Central Committee, the rural communes and brigades in Shanxi Province have done well regarding food production and at the same time they have also made great efforts in constructing commune and brigade coal mines. But due to the improper "leftist" influence, the development of commune and brigade coal mines a few years ago was blind, the layout was irrational, the safety conditions were poor, the workers were accident prone and the recovery rate of resources was low. In 1981, the management branches of the various levels of commune and brigade enterprises in Shanxi Province stand out for grasping the readjustment of commune and brigade coal mines. Safety reorganizations are continuously being made, technical revisions are carried out in a planned and organized fashion; the number of wells has been reduced and mines are operated jointly, more than 500 coal mines in Shanxi Province are now run jointly by commune and commune, brigade and commune, commune and brigade, county and commune, and military and civilian. Such jointly operated coal mines acquired advantages in all aspects: the scale of mining is suitably increased, the ability to prevent accidents is strengthened, technical training is provided, mining methods are improved, the resource recovery rate is improved and all this makes the development of commune and brigade coal mines healthy during the readjustment. In 1981, a total of 183 mines are being improved, out of which 139 have completed the improvements. The commune and brigade coal mines in Shanxi Province have also conducted 5,000 man-sessions of technical training and upgraded production and reduced accidents.

Another direct reason for the good prospects of commune and brigade coal mines in Shanxi is the deployment of the economic responsibility system, which enlarged the autonomous rights of the enterprise, improved the profit-sharing scheme, gave more benefits to the producing commune and brigade, and motivated the activeness of the producers. A number of coal mines at various locations have signed production contracts with the commune, and the mines pay the workers according to a graded progressive computation. The expenses are on a fixed quota and the savings can be kept by the worker. This has vigorously promoted production, and the cost per ton has had a pronounced decrease.

Shanxi's Coal Exports

Taiyuan SHANXI RIBAO in Chinese 9 Sep 81 p 1

[Article by Liu Xiangdong [0491 0686 2639] and Liu Fugui [0491 1381 6311]: "Shanxi Exported 350,000 tons of Coal in the First 7 Months; Manifesting Superiority and Earning Foreign Exchange"]

[Text] Shanxi's local coal exporting company, taking powerful measures and using every available means, has quickened the export of local coal. In the first 7 months this year alone, 350,000 tons of coal have been shipped to ports, then on to various parts of the world.

Coal exports from Shanxi used to be managed by the China National Hardware and Minerals Import and Export Corporation, and coal production was dictated by the unified national plan. Last year, establishment of a local coal exporting company was approved by the concerned national government department. This company is to manage exclusively the export of local coal.

After this company was established, the state invested 4 million yuan for the construction of a coal storage site more than 55,000 square meters in area at Qinhuangdao harbor. With assistance from the provincial economic commission and the provincial coal management bureau, this company carried out a general survey of the coal resources, the production capacity and the coal quality of a number of mines including Yanbei, Datong, Jinzhong, Luliang and Linfen. Based on the survey data, a number of export coal mine points were selected and those export coal mines which lacked some necessary production equipment such as coal crushers and coal selectors were provided with investments and loans in time to solve the problems. As a result, the quality of export coal was guaranteed and the export rate was increased. According to the statistics, over a period from July last year to July this year, a total of 640,000 tons of local coal have been moved to the port storage site and more than 410,000 tons have been shipped abroad, earning foreign exchange amounting to US $17.92 million and a pure profit of more than 26.34 million yuan. It has not only increased China's financial income but also contributed significantly to the four modernizations.

Shanxi Statistics Reported

Taiyuan SHANXI RIBAO in Chinese 21 Sep 81 p 1

[Letter from Ren Binghang [0117 4426 0474], Liu Yongquan [0491 3057 3123], and Ji Zhongshi [0370 0022 2514] of the Shanxi Provincial Bureau of Coal Management: "Statistics of Coal Output in Shanxi's Major Bureaus of Mines in the First Seven Months of 1981"]

[Text] Comrade editor:

Currently there are 70 integrated mining facilities in Shanxi Province. In the first seven months of 1981, Shanxi's coal output has reached 11.78 million tons, which amount to 38 percent of the total extraction of the seven large unified distribution coal mines. Among the mining bureaus in Shanxi, Datong and Yangquan have approached the 50 percent level of integrated mechanized mining of coal. Of key importance in improving the coal output of Shanxi are the sound management and usage of mining facilities and the effort to boost the output of individual mining teams. With this in mind, we now provide you with production data of the large mining bureaus in Shanxi for the first seven months of 1981 and hope you will publish them so that various units can learn from each other and work together to improve coal production.

Comparison of coal outputs at major mining bureaus
in the first seven months of 1981

Project Unit:	Datong	Yangquan	Xishan	Fenxi	Luan	Jincheng
Unit production (tons)	33770	39914	38326	40506	41225	39025
Miner efficiency (tons)	13.697	16.049	18.175	10.86	17.891	14.77

Overall, the production status of integrated mining in Shanxi in 1981 is good. In the first seven months, the average output of integrated mining teams has reached 36,475 tons --- 2,074 tons higher than the output of the same period last year --- and the individual miner efficiency is 14.86 tons, an improvement of 1.06 tons over the same period last year. However, there also exist a number of problems. To name the major ones, coal surface is improperly laid out in some integrated mining teams, equipment is poorly matched, excessive time is spent on moving, there is poor management and equipment repair, mechanical and electrical accidents and injuries and casualties still occur from time to time, and in certain teams, fighting for equipment still exists. The development of integrated mining is very unbalanced; for example, team No 4 of the Yongdingzhuang mine of the Datong mining bureau, which has the best production record, produced a total of 75,000 tons of raw coal in the first seven months of the year whereas the poorest team had an output less than 10,000 tons. Today there are still ten low output integrated mining teams; if their unit production can be improved to the average level, the raw coal output of Shanxi will be increased by 20,000 tons per month. We hope all the production units will look at these records and compare to see whose efficiency is high and who makes greater contributions. In the comparison, find out how far they are falling behind, learn from the good performers, develop the full force of integrated mining facility and improve the coal output as quickly as possible to support the modernization construction of the socialist society.

Editor's reply

In 1981, the increase of coal production in Shanxi Province has been slow and advances are limited. One prominent problem is the decrease of unit production and unit advance at the coal surface. Causes for the decrease can be attributed to low show-up rate, low work hours and under utilization of machines. If the coal production is to be improved, great efforts must be made to shape up the organization and discipline of the labor force, improve all personnel efficiency and per unit production and footage figures. In the letter written by Comrades Ren Binggang et al, integrated mining outputs of the large unified distribution coal mines in Shanxi Province are compared. We hope that, in comparing these results, all the production units will catch up by learning from the advanced units and improve the unit production at the coal surface in order to boost coal output as quickly as possible.

Shanxi Increased Output Continues

Taiyuan SHANXI RIBAO in Chinese 3 Oct 81 p 1

[Article by Wang Zhenhua [3769 2182 5478]: "Shanxi Continues To Increase Coal Output During Readjustment"]

[Text] Holding fast to the route of developing potential, restructuring and improvement, local coal mines in Shanxi Province have strived to improve the integrated production ability of the mines. Raw coal output has had large scale increases from year to year and the outlook of the mines has undergone profound changes. These changes have manifested themselves in four areas:

I. Production ability has continued to improve and raw coal output has maintained a definite growth during the readjustment period.

Up to the present, local coal mines have completed the modification tasks for 42 pairs of mineshafts and the coal output has increasd from 4.37 million tons before the modification to 8.87 million tons, which is more than a 100 percent increase.

In 1979 and 1980, raw coal output of the local coal mines averaged an annual growth of 16.44 percent. In the first eight months of 1981, raw coal output increased by 14.28 percent as compared to the same period last year and the national quota was overfulfilled by 7.73 million tons. By the end of 1980, raw coal output of the local coal mines was up to 49.28 percent of the total coal output of Shanxi Province.

II. Accident-proofing ability has been noticeably improved and the number of incidents has continued to decline.

Since August 1980, the local coal mines have conducted consolidations strictly according to the 10 standards issued by the Provincial People's Government and have subsequently closed 841 small coal mines that lacked safe production conditions and were irrationally laid out. Among the local coal mines, 32.5 percent have eliminated one-eyed shafts, open-flame lighting, open-flame firing and natural ventilation. Coal mines threatened by natural disasters such as flooding and fire have been greatly reduced.

III. Mining methods have been greatly improved and the recovery rate of coal resources has also increased.

In 1979, the number of new coal surfaces in local state-operated coal mines was 22.1 percent of the total number of coal surfaces and the output from new coal surfaces has reached 48.21 percent of the total extraction figures. In 1980, the number of new coal surfaces was increased by another 10 percent as compared to 1979, and the output from new coal surfaces has reached 54.35 percent. Extraction recovery rate in 1980 was 3.6 percent higher than that in 1979 and, under the same conditions, an extra 3.56 million tons of coal were recovered for the nation. Outputs from metal framed coal surfaces and high quality coal surfaces have also had large scale increases.

IV. Twelve railways exclusive for coal transportation were built and the ability to ship coal was improved.

Over the past two years, local coal mines have built 12 railways with a total length of 80.5 kilometers and a coal shipping capacity of 6.6 million tons for the exclusive purpose of hauling coal. In addition, 10 more coal transporting railroads with a total length of 114.1 kilometers are under construction. Up to now, local coal mines of Shanxi Province (including 6 state-operated unified-distribution mines) are in possession of 43 exclusive coal-hauling railroads with a total length of 301 kilometers and an exporting capacity of 24 million tons. In 1980, coal shipped from local coal mines to other provinces has reached 27.86 percent of the total amount of coal shipped out of Shanxi Province.

Datong Bureau Exceeds Quota

Taiyuan SHANXI RIBAO in Chinese 3 Oct 81 p 1

[Article by Ma Yuxiang [7456 3768 4382] and Liu Fanli [0491 2753 7642]: "Datong Mining Bureau Completes September Assignment and Overfulfills Quota"]

[Text] With the courageous spirit of a Taishan climber, employees of the Datong Mining Bureau have worked hard to increase coal output. After overfulfilling the national quota for six consecutive months, the raw coal output of Datong Mining Bureau in September was 2.0395 million tons--again exceeding the national quota. Increases in extraction and enlargement footage have both exceeded quota.

For a period of time at the beginnning of 1981, raw coal output of Datong Mining Bureau fell below target. Various levels of leadership at the Bureau made serious analyses of the reasons for low output, initiated criticism and self-criticism, established the concept of overfulfilling the quota in 1981 and 1982, and strived to boost production. Since March 1981, as the result of a concerted effort by everyone in the Bureau, raw coal output has climbed steadily, overfulfillment of the quota was realized for 6 consecutive months, and most of the deficit in production near the beginning of the year was made up. In September, the Datong Mining Bureau kept up the spirit and established 10 concrete measures for increasing output by making good use of the forces at hand and developing further potential.

September is a very busy month in the Yanbei area since both the autumn harvest and the traditional "mid-autumn" festival fall in September. More than 100 leading cadres from the Bureau and the mines went deep into the brigades and the group units to strengthen political thoughts and to insure attendance. At Jinhuangong mine, with the "five initiatives"of party members, league members, model workers, brigade cadres and group leaders, the attendance rate of extraction and forward digging workers in September reached 75 percent, which insured the normal progress of production and led to an output 12,400 tons above quota. According to unofficial statistics, 4,710 workers at Datong Mining had made plans to return to their villages for the autumn harvest or for vacation; with proper arrangements, they have delayed their vacation and made new contributions in obtaining a good coal output.

Duerping Mine Production Increases

Taiyuan SHANXI RIBAO in Chinese 7 Sep 81 p 1

[Article by Li Taixian [2621 1132 6513], Sun Huaiyu [1327 2037 1342] and Niu Gengtian "3662 5087 3944]: "By Strengthening the Political Work and Treating the Three Relationships Correctly Duerping Mine Strives for Speed Amidst Reorganization"]

[Text] Duerping mine of the Xishan Mine Bureau correctly treated the relationship between production and reorganization, insisting on good coal production during the reorganization, and made its coal yield increase season after season. In the 2 years of 1979 and 1980, the raw coal production increased on average more than 10 percent each year, realizing a profit which increased on average more than 80.1

percent a year. From January to July this year, the raw coal production increased 15.7 percent compared with that of the same period last year, and realized a profit which was 26.1 percent higher than that of the same period last year.

The reasons why Duerping mine was able to maintain a steady rate of expansion are as follows: They treated the relationship between production and reorganization correctly and strived for progress amidst reorganization and increased production amidst reorganization. In the beginning there were some misunderstandings among a number of cadres at the mine. They considered that reorganization meant retreat and to implement reorganization meant to hold down production. The party committee member of the mine, focusing on this misconception, instructed the staffs and workers and showed them how to treat the following relationships correctly: 1) Relationship between the local and the whole: The nation is urgently in need of coal. Coal production may only increase and may never decrease. Local considerations must give way to national ones, and internal reorganization of an enterprise must follow the reorganization of the national economy. 2) Relationship between production and reorganization: If local coal production is not increased, then the national income cannot be increased and neither the enterprise nor the workers will benefit much. The speed at which reorganization can be carried out will be adversely affected by all this. 3) The dividing line between a high standard and an advanced standard: We must oppose not only the unrealistically high standard but also exaggeration of difficulties. We must fight the pessimistic and conservative idea which prevents us from achieving increased production in spite of our capacity. Through education, the thoughts of workers as well as cadres were unified around correct concepts, so that the morale of all the employees of the mine was kept high throughout. Upon this foundation, they have conscientiously implemented the policy of distribution according to the labor and various other kinds of economic responsibility systems within the enterprise. They have aggressively pursued mechanized mining method and thus expanded their coal productivity considerably.

The experience of Duerping mine proved that maintaining a steady rate of increase of coal production not only did not adversely affect the rate of reorganization but, in fact, helped it. From 1979 till today, this mine has retained a portion of profits amounting to 3.04 million yuan, and renewal and remodeling funds amounting to 6.75 million yuan, thus completely eliminating the problem of a shortage of capital needed for the reorganization. Up until now, the entire mine has completely made up more than 6,300 meter footage advance shortfall, solved its disproportion problem in mining and, as a result, the excavation, preparation and recovery projects have all exceeded the standard set by the government. The projects related to the construction of fringe benefit facilities for the staffs and workers have cleared away more than 59,100 square meters of area, and the area on which work has begun is up to 40,000 square meters. The engineering projects related to the construction of ground storage, loading and transportation system have been completed. The engineering projects related to the construction of ventilation systems and safety measures are progressing rapidly, and these projects are expected to be finished ahead of schedule. Last year, the average income of the staff and workers also increased from 78.4 yuan a month in 1978 to 100 yuan a month.

Fenghuangshan Output Up

Taiyuan SHANXI RIBAO in Chinese 7 Sep 81 p 1

[Article by Wang Qingping [3769 3237 1627] and Zhou Mingding [0719 2494 1353]: "Stirring Up the Revolutionary Spirit and Striving to Increase Coal Production, Fenghuangshan Mine's Raw Coal Production Increased Rapidly"]

[Text] The entire staff and workers of Fenghuangshan mine, under the Jincheng Mine Bureau and under the leadership of party committee members, have stirred up the revolutionary spirit and strived to increase coal production in order to support the national economic readjustment. The raw coal production of the entire mine doubled from 1977 to 1980. During the period from January to July this year, the state plan had been completed for all eight economic indicators, creating a historic high level for the period.

The party committee of Fenghuangshan mine believed that the work conditions at the mine field were full of hardship, and the only way to increase production is to stir up the spirit of sacrifice and perseverance. To do this, they have organized the ranks of staff and workers well, and have taught the workers and cadres the revolutionary philosophy of life, love for the mine, and dedication to the mine. They explained to the workers the important position occupied by the coal industry in the entire national economy, and the glorious responsibility that rests on the shoulders of the mine workers, filling the workers and cadres with a sense of responsibility and a spirit of sacrifice, so that strong combat spirit and high morale prevailed throughout the mine. In the first half of this year, more than 270 staff and workers were recognized as advanced producers and advanced workers.

The party committee of this mine has also paid attention to the education of party members and cadres so that they can lead effectively by setting good examples and models. The president of the mine, Wang Jiabin, and the vice-presidents in charge of production and safety insist on going down into the mine shafts and work sites in order to understand the situations there so that the problems may be solved more effectively. They are found in the mine shafts, more than 15 days each month. Following the examples set by the leading cadre, the communist party members of the mine are leading the masses day and night engaging in battles with a spirit comparable with that of scaling the Yuhuang summit of Taishan, willing to suffer first before enjoying the fruits of their labor.

Xishan Mines Increase Output

Taiyuan SHANXI RIBAO in Chinese 25 Sep 81 p 1

[Article by Xu Ruoqi [1776 5387 3823]: "Three Projects in Xishan Mining Bureau Reach High Targets"]

[Text] Xishan Mining Bureau has achieved very good economic results in their efforts to increase output and reduce costs. From January to August, the cost per ton of coal mined in Xishan Bureau has decreased to 14.77 yuan, the lowest among the unified-distribution coal mines in China; 52.39 million yuan of profit was achieved and 47.18 million yuan of contract payment was made to the State, the absolute values of the profits realized and the contract payments made have placed Xishan Mining Bureau second from the top among China's unified-distribution mines. This Bureau has also overfulfilled raw coal production quota by 440,000 tons, which is the second highest among the nation's unified-distribution coal mines.

In 1981, because of price increases in steel and lumber and other policy reasons, the cost per ton of coal at Xishan Mining Bureau would have been 1.71 yuan higher than that of 1980. Computations based on the raw coal production plan set by the State, there would be a 15.41 million yuan expense increase at Xishan mines. The Bureau's Party Committee explained the factual difficulties to the employees and mobilized the work force in a great effort to develop the potential within the enterprise, worked hard to increase output, conserve resources and lower costs. Since May, they have initiated an enterprise consolidation which consists of examining the system, the leadership, the discipline and the weaknesses and improving the economy in the enterprise and they have improved the management. This has led to an accumulated costs per ton of coal for the first 6 months of 1981 lower than the target by 0.09 yuan and insured the completion of contract payments.

In consolidating the enterprise, the Xishan Mining Bureau seriously promoted a variety of economic responsibility systems and made clear-cut regulations concerning the jurisdiction, economic responsibility, contract, method of computation, usage of funds and award payments for the bureau and mines (plants and offices). They have placed the targets of increasing revenue and cutting costs solidly on the basis of wards, teams and individual workers and linked them up with the employee's income to motivate the worker's initiativeness. From January to August, 1.74 million yuan were saved at Xishan Mining Bureau just from the savings on mine lumber, metal props and explosives alone. The total value of increased income and reduced costs has reached 19.57 million yuan, which is equivalent to an average of 3.02 yuan for each ton of coal mined.

Briefs

FIVE PROVINCES' COAL MEETING--The Ministry of Coal Industry recently held a report meeting at (Baisha) Mining Bureau in Hunan Province on the readjustment of the relationship between extraction and tunneling in five provinces, namely: Guizhou, Henan, Anhui, Jiangxi and Hunan. The meeting stressed that to step up coal production, it is essential to attach importance to tunneling work. The meeting pointed out that to fulfill coal production quotas, many coal mines concentrate on coal extraction and disregard tunneling work in November and December every year, resulting in imbalance between extraction and tunneling. The meeting demanded that this situation be resolutely changed, that importance be attached to tunneling and that the relationship between extraction and tunneling be readjusted well. [Changsha Hunan Provincial Service in Mandarin 1100 GMT 7 Nov 81 HK]

GUANGXI COAL PRODUCTION--Guangxi Region's output of coal in September was some 100,000 tons more than in August representing an increase of 28.67 percent; and its tunneling progress was 25.46 percent greater than in August. [Nanning Guangxi Regional Service in Mandarin 1100 GMT 19 Oct 81 HK]

JIANGSU COAL MEETING--A Jiangsu provincial work conference on local coal mines was held in Xuzhou from 29 October to 1 November. Since 1969 a large number of locally operated coal mines have been established in the province. As of the end of 1980 these local coal mines had produced a total of more than 35 million tons of coal in 10 years. The conference called for efforts to maintain the annual output of the local coal mines above the 4 million-ton level. [Nanjing Jiangsu Provincial Service in Mandarin 1100 GMT 6 Nov 81 OW]

JILIN COAL PRODUCTION--In the January-September period, collieries across Jilin Province whose products are distributed under a unified state plan overfulfilled the raw coal production plan by 361,780 tons and the tunneling footage plan by 4,000 meters. The death rate declined by 6.4 percent from the same 1980 period. The rate of ash composition and gangue composition of commodity coal decreased by 74 per thousand and 26 per thousand respectively compared with the corresponding 1980 period, increasing 3.82 million yuan of income for the state. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 6 Oct 81 SK]

SHANXI COAL PRODUCTION--According to the statistics of the Shanxi Provincial Management Bureau of coal mines, as of 21 October, the local coal mines had overfulfilled the year's production quota of 51.31 million tons. This was 71 days ahead of schedule. As of the end of October, the coal mines had overfulfilled the year's production quota by 2,040,700 tons. From January to October, the total production of coal increased by 13.11 percent over the corresponding period last year. In the wake of increasing production, the coal mines in the province have also attached importance to production safety. From January to September, the province exported a total amount of 21,057,400 tons of coal to other provinces and regions throughout the country, an increase of 40.77 percent over the corresponding period last year. In order to make arrangements for next year's production, the provincial coal mines management bureau held a work conference in Shouyang County in mid-October. [Taiyuan Shanxi Provincial Service in Mandarin 2300 GMT 5 Nov 81 HK]

OIL, GAS EXPLORATION CONTINUES; PROSPECTS GROWING

Pearl River Estuary Basin Reserves

Guangzhou YANGCHENG WANBAO in Chinese 12 Aug 81 p 1

[Article by Gong Zhijin [7895 1807 3866] and Liu Weikun [0491 3634 0981]: "Pearl River Basin Is Now Nation's Largest Oilfield"]

[Text] "The Pearl River Estuary Basin, 200 kilometers from Guangzhou municipality, has now been confirmed as China's largest oilfield among the oil reserves already explored. This is the latest news released by Chinese geologists in their recently completed "Oil and gas prospects evaluation report for South China Sea-Pearl River Estuary Basin." It is the result of the hard work of 1,700 South China Sea ocean geology workers.

On 8 August, geologist Dr Jin Qinghuan [6855 1987 3562], principal technical administrator of the South China Sea Geological Survey Command, met with reporters and gave a detailed account of the Pearl River Basin and their efforts of the past 5 years in uncovering the facts.

Ample geophysical survey and ocean drilling data indicate that the Pearl River Basin is a large oilfield with abundant oil and gas reserves. Its geological conditions for oil formation are superior. First of all, the basin has a large area--150,000 square kilometers--and it is one of China's largest basins south of Qinling. The basin has thick sedimentation, ranging from 7,500 to 11,000 meters at the center of the basin. By comparison, the sedimentation layers of the familiar Sanshui Basin and the Maoming Basin in Guangdong Province are generally 3,000 to 4,000 meters thick. The thick sedimentation layer of the Pearl River Basin implies there are many oil-bearing layers. Moreover, there are abundant regional structures properly distributed in the basin. The major regional structures number about 200. These anticline structures are like a bunch of huge oil storage tanks buried deep in the ocean.

The members of the South China Sea Geological Survey Command began geological exploration in the South China Sea in 1975, and in 1976 they discovered the Pearl River Basin. From 1977 on, they explored the northern slope of the basin using the imported "Explorer II" ocean drilling rig. In 5 years, they have completed 48,870 kilometers of geophysical survey, including seismic, gravitational, magnetic and depth measurements. Seven wells were drilled, with a total footage advance of

17,275 meters; among them Pearl No 5 produced high-yield industrial oil. Early this year, the South China Sea Geological Survey Command organized technical personnel, and using the latest technologies including mass spectroscopy, stable isotope, and ultramicropalaeontology, conducted an integrated study of the survey results collected at the Pearl River Basin in the past few years. After a 6-month effort, they have completed the evaluation of oil and gas prospects of the basin.

Jin Qinghuan told reporters that the command's evaluation of the oil and gas reserves of the Pearl River Basin is conservative. Its evaluation is comparable to the calculations of some foreign oil companies and it reached essentially the same conclusions. This evaluation was conducted by the Chinese totally independently and it took only a little over 5 years. One must say the speed is fast. This is sufficient proof that the Chinese petroleum geology technical people are not only capable of finding large oilfields on land, such as Daqing and Renqiu, but are also of the even more difficult task of locating large oilfields in the depth of the ocean.

Pearl River Basin 'Encouraging'

Guangzhou NANFANG RIBAO in Chinese 13 Aug 81 p 1

[Article by Liu Weikun [0491 3634 1024] and Wang Dekuan [3769 1795 1401]: "Oil and Gas Prospects in South China Sea-Pearl River Estuary Basin Are Encouraging"]

[Text] After a 5-year effort by the South China Sea Geological Survey Command of the Ministry of Geology, a large oil-bearing basin was discovered in the north gulf of the South China Sea. NANFANG RIBAO reporters interviewed geologist Dr Jin Qinghuan [6855 1987 3562] and other at the command and heard their encouraging scientific assessment: according to estimates based on the data, the basin's oil reserve prospects are better than those of the largest oilfields already explored in China today. This evaluation was made by the ocean geologists of the South China Sea Geological Survey Command entirely on their own.

The South China Sea is the largest sea in the proximity of China. Its total area is 3.5 million square kilometers, of which 1.96 million square kilometers belong to traditional Chinese sea territory. It has vast shelfs, slopes, lu long and deep sea plains and a series of benthic mountains, troughs and trenches. The complete geomorphology, varied sedimentation environment, and large flow of ground heat created favorable geological conditions for the formation of rich oil resources. Development of an ocean geological survey and the survey and exploration of ocean oil resources are highly significant to the development of China's economic construction.

The ocean geology work in the South China Sea has been going on for 20 years, but systematic investigation only began in the early 1970's. Since 1975, after the discovery of the north gulf basin, investigations were conducted in the Pearl River Estuary Basin only some 200 kilometers from Guangzhou. By the end of 1976, 150,000 square kilometers of the sedimentation area of the Pearl River Basin were defined.

Drilling was organized in 1977, and high-yield industrial oil flow was obtained in 1979. From survey to the flow of industrial oil, it took less than 5 years. This speed is exceptional even in foreign ocean oil geological survey and exploration.

In the last few years, the South China Sea Geological Survey Command has carried out an extensive general geology-geophysical investigation of the Pearl River Estuary Basin and drilled seven wells. In 1981 the command conducted an integrated study of the survey data obtained over the years and started compiling an "Oil and gas prospects evaluation report for South China Sea-Pearl River Estuary Basin," which is due for completion shortly. For the first time the report has made a scientific assessment of the oil and gas prospects: the basin has superior geological conditions; the thickness of sedimentation is great and there are abundant oil-bearing layers and locations; it has a high ground temperature gradient which is favorable for the transformation of organic matter into oil and gas; the contents of organic carbon, chloroform bitumen and hydrocarbons, all important in oil formation, far exceed the standard of oil-bearing rocks; the oil bearing structures have appropriate thickness, complete closure and proper distribution, the favorable oil bearing structures are like natural oil storage tanks buried extensively in the depth of the basin.

Based on the integrated study of the obtained data, the ocean geologists calculated the oil reserve prospects using a chloroform bitumen computation method. Calculation results indicate that oil reserve prospects in the basin exceed those of any of the large oilfields already explored in China.

The rich oil resources of the Pearl River Estuary Basin have attracted attention both here and abroad; quite a few foreign oil companies hurried here to negotiate on development and exploitation of the basin oil reserve. The assessment of the South China Sea-Pearl River Basin oil and gas prospects will play an important role in China's development of the South China Sea oil resources. It is the result of the hard work of the vast ranks of staff and workers of the South China Sea Geological Survey Command system. The exploration and development of oil in the Pearl River Basin will undoubtedly provide energy and capital for China's four modernizations construction; in particular, it will provide a strong material basis for four modernizations construction in Guangdong Province.

Coastal Waters Basins

Beijing BEIJING RIBAO in Chinese 25 Sep 81 p 1

[Article by Li Weiyao [2621 1218 1031] and Huang Fengchu [7806 1144 0443]: "Six Big Oil and Gas Basins Found in Coastal Waters"]

[Text] China's ocean geologists have completed 1 million square kilometers of near-sea petroleum geological survey, discovered six large oil and gas basins and showed that the future prospects of China's oil and gas resources at sea are indeed bright.

The six large oil and gas basins are located at Bohai Basin, South Yellow Sea Basin, East China Sea Basin, and Pearl River Estuary Basin, North Gulf Basin and Yinggehai Basin at South China Sea.

Bohai territory is the first area where the Ministry of Geology conducted its geological survey of petroleum at sea. Ocean geology explorers discovered a 80,000 square kilometer depression in Bohai that is rich in oil and gas reserves. This depression is an extension of Shengli, Dagang and Liaohe oil fields in North China Basin toward the sea and is connected at the bottom of the ocean to the surrounding oil and gas bearing basins on land. Its total land and sea area is 180,000 square kilometers. The departments of petroleum industry have conducted detailed survey in this area and drilled a number of high yield oil and gas wells.

The South Yellow Sea depression is an extension of the north Jiangsu oil and gas bearing basin toward the bottom of the ocean, the land and the sea combined to form the North Jiangsu-South Yellow Sea Basin. The area of the ocean bottom portion alone is 78,000 square kilometers, there are more than 40 possible oil-bearing structures in the basin and the thickness of the oil producing rock layer is 5000 meters. Geology departments have drilled 8 holes in this area and discovered that the oil bearing rock system is similar to that of the north Jiangsu oil and gas basin.

The East China Sea Basin has the best prospects for oil at sea. Its area is 460,000 square kilometers, equal to the combined area of the Songliao Basin and the North China Basin. The basin can be divided into three sections: the western section, the middle section and the eastern section. The western section begins at 34° latitude in the north and ends at the Penghu Isles in the Taiwan strait in the south, stretching a length of 1,200 kilometers and an area of 260,000 square kilometers. The thickness of the sedimentary rock at the bottom is over 10,000 meters and 4 promising oil reserve structure belts were discovered. The "Eastern Zhejiang Long Wall" structure belt alone has an area of 5,000 square kilometers; it is an unprecedentedly large structure belt in China's history of petroleum geological surveying. The first oil survey well in East China Sea yielding multiple oil sand and high pressure natural gas was drilled on this structure belt in February, 1981.

The 150,000 square kilometer Pearl River Estuary Basin has a huge formation of third serial oil and gas bearing stratum. After extensive geological and geophysical drilling and survey, prospecting of oil and gas in the Pearl River Basin has now been completed.

China's petroleum geological survey at sea began in the late 1950's. At that time there were only 100 ocean geologists working primarily with fishing boats and apparatus for on-land oil surveing. Now China's ocean oil geological survey team has grown to more than 4,000 people equipped with some 30 survey vessels and advanced equipment for depth, earthquake, magnetic and gravitational measurements and sophisticated drilling platforms. The team conducts comprehensive geological survey of ocean bottom mineral resources, primarily oil, from close to the shore to deep sea areas.

South China Sea, Southern Yellow Sea Prospects

Shanghai JIEFANG RIBAO in Chinese 22 Sep 81 p 1

[Article by Huang Fengchu [7806 1144 1443]: "Prospects for Extracting Oil and Gas at South China Sea and Southern Yellow Sea Are Excellent"]

[Text] The oil reserves in the South China Sea and Southern Yellow Sea are quite abundant and the prospects for extracting oil and gas are excellent. Oil and gas fields at sea with substantial yields are expected to be built. Chinese and foreign petroleum geology experts who participated in the geophysical exploration at sea are in agreement regarding this.

The Ministry of Petroleum Industry recently concluded its oil resource evaluation for eight geophysical exploration zones including the Pearl River Estuary Basin, Yinggehai, and the southern part of the North Gulf in the South China Sea and the Southern Yellow Sea. It has also been decided that cooperative oil exploration and development with foreign oil companies will be open for bids by the end of 1981 or at the beginning of 1982, at the latest.

The total area of the eight geophysical survey regions of the Pearl River Estuary Basin, Yinggehai and the Southern part of the North Gulf in the South China Sea and in the Southern Yellow Sea is 420,000 square kilometers. The Ministry of Geology and the Ministry of Petroleum Industry had conducted some geophysical exploration in the past in these sea areas and a number of exploratory wells yielding industrial oil and gas were drilled at North Gulf, the Pearl River Basin and Yinggehai. In 1979 China opened up cooperation with foreign companies and signed geophysical exploration agreements with foreign oil companies for these eight areas. A total of 48 oil companies from 13 different countries participated in this effort. The oil companies organized more than 700 technical staff in geology and geophysics and deployed sophisticated exploration equipment for this task. In over a year's time, they completed seismic testing for 110,000 kilometers and submitted to China 120 reports on the interpretation of geophysical exploration data and resource evaluation.

China organized more than 200 petroleum geology and geophysical exploration experts and technical personnel and, based on data submitted by the foreign oil companies, conducted a comprehensive analysis and study of the structure, oil reserve, oil yield and coverage conditions of these sea areas and estimated their oil reserve potentials. Extensive geophysical exploration data and drilling data indicate that these sea areas have broad distributions of deep sedimentation rocks and there are mature oil producing strata. More than 400 possible oil-bearing structures of various types were discovered in these regions and among them several dozen are major structures.

South China Sea Oil Meeting

Hong Kong WEN WEI PO in Chinese 22 Oct 81 p 3 HK

[Report by WEN WEI PO correspondent: "Experts Submit Preliminary Reports in Guangzhou Probing into Prospects of Oil Fields in South China Sea"]

[Text] Over 170 top-level marine geologists came to Guangzhou to hold the first South China Sea geological symposium. At the symposium, they put forth data on geological surveys of the South China Sea continental shelf which have been carried out for many years and probed into questions concerning the geological features and oil and gas resources of the South China Sea.

At a time when the world is facing an energy crisis, promising results in prospecting China's offshore oil resources have already attracted the attention of oil circles at home and abroad.

At present, oil produced from offshore oil fields already accounts for one quarter of the world's total oil output. People are placing more and more hope on offshore oil reserves. China has a vast expanse of sea area of which the South China Sea occupies an important position. On 21 October, Ye Xuanping, vice governor of the Guangdong Provincial People's Government, extended his congratulations to the marine geologists who participated in the "South China Sea geological and oil and gas resources symposium" and said that the preliminary reports which revealed the secrets of this seabed treasury were "very inspiring."

In the 1960's, our country's marine geological scientific and technological workers carried out geological surveys in the Yingge waters of Hainan Island. In the 1970's, systematic surveys and prospecting work were carried out. In the first 4 years, geological and geophysical comprehensive surveys were carried out in Beibu Wan [Northern Gulf; Chinese name for Gulf of Tonkin]. As a result, a depression of 2,800 square kilometers was discovered in the middle of the Beibu Wan basin. The ministry of petroleum then carried out prospecting and industrial oil reserves were detected. After this, comprehensive geological and geophysical surveys were carried out over a vast area of 290,000 square kilometers east of the Leizhou peninsula and the Qiongzhou strait, west of Shantou and north of latitude 16 degrees 21 minutes north. The surveys included seismographical tests, marine magnetic surveys, aerial tests, seabed gravimetric tests, seabed structure sampling, geological cross-sectional surveys and drillings.

Data of surveys which have been carried out show that the geological conditions in the South China Sea are very favorable for oil and gas and there are rich resources of oil and gas there. Up till now, we have already discovered six large deposit basins in our country's sea area and three of them are in the South China Sea. This large seabed oil treasury of the South China Sea is extremely worthy of exploitation and development. At present, China is striving to expedite the prospecting, exploiting and developing of oil and gas resources in the South China Sea's continental shelf.

At the "South China Sea geological and oil and gas resources symposium" jointly held in Guangzhou on 22 October by the special Marine Geology Committee of the

Chinese Society of Oceanography, the Chinese Society of Marine Geology, the Chinese Society of Geology, the Ministry of Geology's South China Sea Survey Command, experts, professors, senior engineers and technological personnel with rich experience from 50 units concerned--the Ministry of Geology, the Ministry of Petroleum Industry, the State Oceanography Bureau of the Chinese Academy of Sciences, the Ministry of Metallurgical Industry, the State Seismological Bureau, universities and colleges--put forth, on the basis of results of geological surveys and scientific investigations which have been carried out over the past few years, over 50 academic papers on the South China Sea's oil-bearing and gas-bearing seabed structure and basin, the formation and changes of basin, the structure of oil reserves, the oil-bearing features of mesozoic strata and prospects of oil and gas resources in order to exchange views and to probe into questions of the South China Sea's geological features and resources. Professor Ye Zhizheng, member of the Earth Science Division of the CAS, vice president of the Chinese Marine Geology in our country has a very short history but it is developing quickly. Offshore drilling was started not long ago either, but gratifying results have been achieved. This gathering of outstanding geologists will certainly raise the level of our country's marine geological science and technology and push forward the exploitation and development of the oil resources in the South China Sea continental shelf.

Also participating in the meeting were Zhu Xia, member of the Earth Science Division of the CAS, director of the Geological Institute of the Geological Division of the CAS and a well-known geologist, Guo Lingzhi, Nanjing University's structure expert, and other top-level Chinese geologists.

Daqing Associated Gas Recovery

Beijing GUANGMING RIBAO in Chinese 27 Oct 81 p 2

[Article: "Daqing Oil Field Associated Gas Successfully Pressurized and Collected"]

[Text] Using Chinese-made compressors, Daqing Oil Field has recently succeeded in pressurizing and collecting associated gas and provided an effective means for improving collection and transportation technology and for conservative energy.

Oil field associated gas is a valuable chemical resource and fuel, about 6 billion cubic meters of associated gas are produced every year in various oil fields in China. In the past, due to the scattered gas sources and the low pressure, and due to the lack of suitable compressing equipments and associated facilities, it was difficult to collect and utilize the associated gas and most of this resource was not recovered and properly used. To correct this situation, Daqing began its experimentation of associated gas compression and recovery. Using its compression and collection facility, Daqing collected a total of 3.8 million cubic meters of associated gas. After subtracting the losses, this is equivalent to a recovery of 3600 tons of crude oil and the amount of energy used in the recovery is only about 6 percent of the energy recovered. Tests show that the Daqing compressing and collecting system is simple in structure, easy to maintain and can be promoted to wider use.

Remote Sensing Reveals Fossil Fuel Deposits

Beijing XINHUA in English 0243 GMT 3 Nov 81 OW

[Text] Beijing, November 3 (XINHUA)--Chinese scientists have completed a large-scale regional geological survey in Sichuan basin by applying remote sensing techniques and got a wealth of stratigraphic, structural and mineral data.

XINHUA learned this today from He Shangrong, engineer of the Sichuan Geological Bureau, who is here attending the current second Asian conference on remote sensing.

He said the results obtained have deepened geologic research and improved the quality of mapping. Chinese scientists have accumulated significant data for predictions of some mineral deposits by means of remote sensing images and synthetic interpretations.

He said the coal-bearing beds in the Chong-Qing and Guangan areas which appear on the remote sensing image in clear light stripes have been proved to be coal-producing areas.

The ring structures in the area are favorable guides for finding oil, natural gas and salt, he said. There are good prospects for finding salt deposits. "The anticline should be an important area for exploration," he said.

In central and northwest Sichuan there are closed arch structures which provide important hints for searching oil and gas, the engineer said. In the east Sichuan foldbelt, coal- and iron-bearing beds mostly lie in the core of the anticlines. Several such deposits near Chongqing have been verified by drilling.

He said the depositional environments of the depression in front of the Longmenshan in the western fringe of the basin are very important aress for exploration of salt, glauber salt and other deposits.

New Petrochemical Technologies

Beijing GUANGMING RIBAO in Chinese 23 Aug 81 p 2

[Article by Shi Hua [4258 5478]: "Petrochemical Institute Develops New Fossil Fuel Technologies"]

[Text] The Petrochemical Institute of the Ministry of Petroleum Industry has obtained three major scientific research achievements in recent years in its development of energy conservation and mazut processing. Pronounced economic effects have been obtained after these research results have been promoted and employed in industrial production.

In 1977 the institute began a research project on a carbon monoxide catalytic combustion supporter. After 1 year, five types of combustion supporter were successfully developed in the laboratory. In 1979, in collaboration with the Yumen refinery, the institute conducted industrial tests on a 12-ton scale catalytic cracking device which were successful in the first run. By the end of 1980, 19 refineries were already using the new technique. Two years' application has shown that the new technique using a carbon monoxide combustion supporter decreases the carbon monoxide content in the flue gas exhausted from the regenerator from 8 percent to less than 1 percent and greatly reduces the pollution of the atmosphere. The method allows heat to be recovered and decreases the energy consumption by 100,000 kilocalories for each ton of catalytic input. The method also improves the collection percentage of gasoline and light diesel fuel; on average the increase is 2 to 4 percent for light fuel oil. Preliminary estimates show that the 19 refineries using this new technique produce 200,000 to 400,000 tons more gasoline and diesel fuel for the country each year and burn 100,000 tons of fuel less, with a total economic benefit of more than 50 million yuan.

In addition, in 1980 the technique of mixing and refining mazut in the catalytic cracking process developed by the institute was proved successful in industrial tests conducted at the Modanjiang refinery. This new technique increased the collection percentage at the refinery by 9.2 percent, for a net profit of 4.78 million yuan in 1 year. This technique is also beginning to be used by refineries where the catalytic input is insufficient, and the economic benefits will be even more pronounced, especially at large plants. In 1979, the technique of residue solvent de-bitumen process and catalytic cracking were successful in tests conducted at industrial facilities at Dalian Petroleum Plant No 7. Using the combined techniques, 31 tons of gasoline, 28 tons of light diesel fuel, 7 tons of liquefied gas and 25 tons of surface asphalt can be obtained from 100 tons of oil residue. The techniques have received the attention of relevant departments and refineries, and promotion activities are being organized.

Briefs

ANNUAL OIL QUOTA PROGRESS--Beijing, 1 Oct (XINHUA)--China's oil industry produced 75,554,000 tons of crude oil in the first nine months this year, fulfilling 76 percent of its annual quota, announced the ministry of petroleum industry. During the third quarter, some of China's big oil and gas fields such as Karamay in Xinjiang, Dagang near Tianjin and the Sichuan oil and gas field were hit by windstorm, heavy rain or flood. The workers soon restored normal production with the assistance of local authorities and met the production targets for July to September. In some oil oil-producing areas, effective measures were adopted to raise recovery rate and prolong the period for stable daily production. [Beijing XINHUA in English 0155 GMT 1 Oct 81 OW]

GOBI DESERT EXPLORATION--Chinese petroleum exploration is being carried out in the Gobi Desert in northwest China, regions of carbonate rocks in southwest China, east China for deep reservoirs and offshore areas, said Niu Yuquan, 46, a geophysicist of the China Petroleum Exploration Development Corporation at a joint meeting in Beijing of the Chinese Geophysical Society and the American Society of Exploration Geophysicists. The offshore regions include the Bohai Bay, Yellow Sea, East China Sea and South China Sea. Chinese geophysicists in the last three decades have adopted various seismic methods according to the geological conditions of each oil bearing basin and achieved good results, Niu said. The Gobi Desert and loess high-lands in northwest China, the regions crisscrossed by water in northern Jiangsu Province and in Jianghan Plain, the mountainous districts and karst limestone zones in the southwest and the basalt zones in Hainan Island and northern Jiangsu were very difficult areas for seismic work. Niu said. However, through long practice, the Chinese geophysicists have understood the seismic problems more clearly. Niu Yuquan said that China had begun to develop digital recording and data processing in the late 1960's and early 1970's. As a result, China had discovered a series of buried-hill oilfields, for example, the Renqiu oilfield in north China found in 1975. He said that China would try to combine seismic methods with other geophysical methods and improve field operations and data processing. [Hong Kong TA KUNG PAO in English 17-23 Sep 81 p 6]

POWER-HYDROPOWER GENERATION, SUPPLY IMPROVING

Overall Planning Advocated

Beijing SHUILI FADIAN [WATER POWER] in Chinese No 7, 12 Jul 81 pp 4-6

[Article by He Gegao [0149 2706 7559]: "Overall Planning in the Development of Hydroelectric Power"]

[Text] Both coal and petroleum are now in short supply in our country, and the development of hydroelectric power has come to be recognized as an aspect of strategic energy policy in the development of the national economy. Leading comrades of the Central Committee accord full importance to the development of hydroelectric power, and have frequently declared that more should be done in this area, and Premier Zhao Ziyang has stated that the purpose of its development is to create prosperity for future generations. Hydroelectric power can provide cheap motive power and can perform the functions of peak load regulation, frequency regulation, phase regulation and reserve power in the electric power system, in addition to offering the benefits of flood prevention, irrigation and navigation. But hydroelectric power generally involves rather large investments and long construction times, as well as the problem of loss of the inundated territory, and accordingly, there has been some hesitation in drawing up long-term plans and organizing annual plans. Because hydroelectric power is a component of the electric power system and also a component of the comprehensive use of rivers and streams, planning for hydroelectric power should take account of the whole picture, including both the electric system and comprehensive utilization, should make comprehensive plans and draw up overall balances, take account of all of the economic benefits from hydroelectric power, and draft long-term, comprehensive plans to guide the organization of annual plans. Here we advance a few preliminary opinions on taking account of all relevant factors in hydroelectric power planning.

1. Taking Account of All Economic Benefits for the Power System as a Whole

The electric power system must supply electric power steadily, safely, flexibly and economically; this is possible only if hydroelectric and fossil-fueled power stations complement each other, and a power system relying on only one of these types would be impracticable. Because both hydroelectric and fossil-fired stations have characteristic advantages and disadvantages, only by integrating them closely together so as to exploit their advantages and make up for their shortcomings is it possible to obtain the best results. For example, fossil-fired power stations can only operate steadily if a supply of coal is guaranteed; they can be used for a large percentage of the time, and the more steadily they generate electricity the more economical they are. But fossil-fired generating units start up slowly, requiring 2 or 3 hours from ignition to the beginning of power generation, and accordingly they are incapable of flexibly handing peak load adjustment and frequency adjustment in a system and providing a quickly-available emergency reserve. If fossil-fired power stations are made to take on these tasks, the starting and stopping of the generating units will decrease the proportion of time during which they are in operation, coal consumption per unit power output will increase, the life of the generating units will be shortened, and there will be more malfunctions, which is uneconomical and unsafe. According to statistics from the Northeast China Power Industry Management Office, a drop in the proportion of electricity generated by water power in the Northeastern power system forced the fossil-fired plants to make up a large proportion of the peak load; the average peak load adjustment by fossil-fired stations in 1979 was 800,000 kW, of which 600,000 kW was taken on by high-temperature, high-pressure units, and 20,000 kW by medium-temperature, medium-pressure units, with the result that some fossil-fired generating capacities remained unused, which limited utilization of fossil-fired stations' superior feature of being able to produce electricity as long as coal is available. According to preliminary statics, in 1979 there was a power production shortfall of 2.9 billion kWh. When fossil-fired stations were used to regulate peak load, coal consumption went up greatly; if the 800,000 kW peak load regulation had been shifted from fossil-fired stations to hydroelectric stations, coal consumption in the main power grid would have been decreased by an average of 7 g [per kWh], which could have resulted in the considerable saving of more than 20,000 tons of coal over the year. In addition, the ignition of coal-fired units requires ignition oil; a 1,000-kW unit generally requires 1-2 tons, a 5,000-kW unit about 5-6 tons, and a 10,000-kW unit about 20-30 tons. Accordingly, frequent stoppages of coal-fired power generating units is very uneconomical. The situation is different for hydroelectric stations: in general, the quantity of electricity generated by hydroelectric stations is affected by water availability, so that in dry seasons their capacities decrease considerably and they cannot meet the system's requirements steadily, but they are easy to switch on and off, generally requiring only 1 or 2 minutes, which makes them extremely flexible in peak load regulation, frequency regulation and response to sudden system failures. When hydroelectric stations are available to take on these tasks, fossil-fired stations can be kept in steady, economical operation, so that the entire system is in its optimal state. In addition, the generating units of the hydroelectric and fossil-fired power plants in an electrical system generally have to be overhauled in rotation, and we can make use of the high-water season, when hydroelectric power output is high, to overhaul fossil-fired units. Accordingly, the fact that hydroelectric power stations are in use for a smaller percentage of the time is not an essential shortcoming, but results from the fact that the entire system requires that they take on tasks which are difficult for fossil-fired power stations, so as to improve the overall operating state of the system. If we draw up a power balance for the entire system, we can find a suitable time percentage of utilization for hydroelectric stations and determine the proper time percentage of operation for each hydroelectric station within the overall inventory of hydroelectric stations. We should not say uncritically that the small percentage of time utilization of hydroelectric stations is a shortcoming, nor should we consider economy of operation only in terms of hydroelectric stations alone; instead, we should consider economy in terms of the entire system. Of course, we should also avoid uncritically increasing the generating capacities of hydroelectric power station equipment in order to decrease unit construction costs. In systems where hydroelectric power accounts for a large share of the total generating capacity, the hydroelectric stations will have to take on a part, even a considerable part, of the base load. In the Southwestern part of our country, where water power is particularly abundant and the conditions for its development are rather good, and where rich deposits of nonferrous metals are also located, some hydroelectric power stations are built for the extraction and refining of nonferrous metals, so that the percentage of time during which they are in operation must be high.

To summarize, in an electrical power system, overall planning and comprehensive balancing must be conducted on the basis of load characteristics and the energy situation and in terms of system stability, safety, flexibility and economy so as to determine the suitable ratio between hydroelectric and fossil-fired stations. In areas with limited water power resources, where the hydroelectric stations primarily provide [storage] capacity, the percentage of hours in operation can be somewhat low, as in the Northeast and East China regions, where the requirement is only for about 2,000 to 3,000 hours of operation; the figure can be even lower for the North China area, and in the Beijing-Tianjin-Tangshan area the construction of pumped storage power stations, using excess fossil-fired electrical capacity during low-load periods to pump water to high-altitude reservoirs, releasing it at peak periods to generate power for load regulation, has even been suggested. In areas where water power is plentiful, such as parts of the Southwest and the upper reaches of the Yellow River, hydroelectric stations will account for more of the power generation capacity, hydroelectric equipment may account for more than half of the overall system, the utilization ratio for hydroelectric power may be 5,000 hours or even more. This requires that the entire electric power system be taken into consideration in drafting rational long-term plans so as to develop hydroelectric power in a planned and systematic manner and make suitable adjustments in the annual plans. We should avoid the past faulty situation in which "hydroelectric power was rational in the long-term plan but could not be organized into the annual plans," and when in fact there was no detailed, analytical long-term plan.

2. Overall Consideration of Expenditures and Receipts

In the past, when selecting a power generation program, whether the choice was between different types of hydroelectric power stations, between hydroelectric and fossil-fired stations, or between large-size or medium or small-size stations, emphasis was generally placed only on the investment per kilowatt or kilowatt-hour for the project, which was a quite inadequate approach; to know whether a project is economically rational, it is necessary to take expenditures and receipts into consideration, as described below.

A. When calculating the investment in electric power construction, we cannot take account solely of the investment in the station, but must also calculate the cost of various necessary projects associated with the station. When making comparisons between projects for hydroelectric and fossil-fired stations or when discussing the economic effect of a hydroelectric station in terms of its replacement of another station, in addition to calculating the investment in the construction of the station (including land acquisition, population resettlement, relocation of factory and mining enterprises and posts, telecommunications and transport routes and the like), it is also necessary to figure in the investment for transformer facilities, environmental protection and the like. In the past, when making comparisons hydroelectric and fossil-fired power stations, fuel expenses were computed only when figuring the annual operating cost, and no account was taken of investment in the increased fuel storage area and fuels transport lines or roads required for fossil-fired stations; this is the method commonly used in Europe and the United States. Today many people believe that this method is irrational; this country differs from the European countries and the United States, since here the investments in power stations and associated construction are all provided by state finance departments, and if the capital construction costs for a fuel storage area and fuels transport lines or roads and other engineering are taken into account, this will enable the planning departments to choose between power generation plans by giving consideration to all the financial, material and resource aspects--especially since our country's current low fuel prices do not reflect the real social labor value.

When calculating investments, we must also take account of the fact that different proposals require engineering work of different duration. In the past, when calculating investment we took no account of interest, and thus ignored the fact that the investment was lying idle, with the result that we did not perceive the effect of the duration of construction on economic effect. Some large-scale projects with a long construction time and high investment were selected only because the investment per unit power output was low; conversely, some relatively small-scale projects with short construction times and low investments were rejected only because their investment per unit power output was high. If we were to compute the length of time the investment was lying idle and the recovery period, it is quite possible that at present, when this country's financial organizations are hard-pressed, more small-scale projects with a short construction time, low investment and rapid return would be selected and that limited investment funds would not be spent on huge projects which would give a return only in 10-odd or 20 years.

B. As everyone knows, hydroelectric stations do not consume fuel, and in-plant power consumption is only 1/40 that for a fossil-fired stations, in addition to which management expenditures are lower, so that operating expenses are always lower than for fossil-fired stations. However, if specific, detailed calculations are not made for every alternative plan, we will not understand the economic effects of investments, nor will be select the most rational project when choosing between different hydroelectric power stations or between hydroelectric and fossil-fired stations.

C. In comparing proposals for power construction projects, in addition to calculating investment and operating expenses we must also calculate economic results, and we must compare various power station proposals in terms of satisfaction of the requirements for a certain load level with or a certain load task (base load, intermediate load, peak load) with a given power system. When the alternative proposals include hydroelectric, fossil-fired and nuclear-powered stations, after a power or energy balance is drawn up for all of these alternatives on the same load curve, economic accounting is then carried out; it is necessary to calculate for each proposal not only the total investment in the power station and associated engineering (including interest on the investment) and operating expenses after the station goes into operation, but also the economic effect realized after the station goes into operation. If these expenditures and benefits are aggregated for a number of years, using a state-specified time period, and tables or curves are drawn up, it will be possible to see clearly the difference between the expenditures and income for each proposed alternative year by year, the various investment recovery periods and the true economic effect, making it possible to select an economically rational proposal.

3. Taking Full Account of the Benefits from Comprehensive Utilization

Building hydroelectric stations changes the natural condition of rivers and streams and thus necessarily produces many contradictions. For example, when a dam is built, producing a reservoir, fields, towns, enterprises, transport lines, forests and the like upstream are inundated, a large population must be resettled, and the passage of boats, timber and fish may be hindered; on the other hand, a reservoir may make possible irrigation, flood prevention, improved navigation, aquatic products breeding, environmental improvement and other important benefits. These matters all affect the interests of various departments, which will make different, contradictory requests. If these contradictions are well handled, the benefits will outweigh the disadvantages, and generally this will help promote the early construction of hydroelectric power stations, producing many benefits. Conversely, the contradictions may drag out the construction of a hydroelectic station or even prevent it from producing the benefits which it should produce after construction. We must consider the problem from all sides, and when developing our country's water power resources we must engage in comprehensive planning and take account of all spects, reach suitable arrangements, and exploit resources in an economically rational manner. The overarching government departments should arrange matters with the offices and localities affected and should coordinate matters effectively. Currently, an especially difficult matter in the construction of hydroelectric power stations is compensation for flooding and resettlement of the population. The areas and organizations which will benefit from a dam always want it to be somewhat higher and the reservoir somewhat larger, while the areas and units to be flooded always want the dam to be lower and the reservoir smaller. In dealing with these problems, the planning departments must take a comprehensive view and make a concrete analysis. On the one hand, they should do everything possible to avoid building high dams and large reservoirs in areas where there are large population concentrations and large amounts of agricultural land upstream, while on the other hand they should build some high dams with large reservoirs whose benefits outweigh the harm they do. In the past, some projects did produce benefits which far outweighed the harm they did, such as the Liujiashan Hydroelectric Stations, which inundated 77,000 mu of agricultural land and caused the resettlement of 33,000 persons but had an installed power of 1.225 million kW, making it the largest main power station in the northwest, and also enabled Lanzhou City's flood protection standards to improve to the level of one flood in 50 years, while the regulated river flow also guaranteed irrigation for more than 10 million mu of agricultural land downstream. The Xishui Hydroelectric Station in Hubei flooded 47,000 mu of agricultural land upstream and caused the resettlement of 49,000 persons, but it had an installed power of 40,000 kW, irrigated more than 500,000 mu and gave flood protection to between 20,000 and 30,000 mu of land. Such projects were rightly undertaken, and projects similar to them should be supported by the state. In the past, there were in fact many problems involved in flooding compensation and resettlement, and in some cases the production activity and living arrangements of the persons displaced still had not been settled more than 10 years after the dams were in operation. The amount of arable land per capita in this country is small, and most agricultural land is located along the banks of rivers, so that special care must be taken in deciding to build reservoirs which flood land and displace people, and every effort must be made to select projects which flood the least land and displace the fewest persons while producing the greatest benefit. In handling compensation for flooding, the principal dealings should be with the locality, the organization in charge of construction should coordinate the work, leadership of resettlement work should be intensified, and rational compensations should be made out of funds specifically earmarked for the purpose with consideration of the interests of state, collective and individual alike, and resettlement work should be done effectively and within a fixed time. In addition, for reasons of navigation and the floating of timber, requests were sometimes made in the past for installations that were on too large a scale, and after they were completed the actual volume of passenger and goods transport and the amount of timber floated downriver were far smaller than the projected figures, so that the project was wasteful; but some other construction departments were only concerned with getting their hydroelectric stations built quickly, and gave insufficient consideration to navigation and movement of logs, with the result that these activities were hindered for a long period. Accordingly, when building hydroelectric power stations, consideration must be given to the interests of both the upstream and downstream areas and to the interests of industry, agriculture, transportation, forestry, aquatic products and the like, and the relationship between all these aspects coordinated, all contradictions resolved, and the greater interests and the lesser harms chosen; all of these approaches involve taking account of all aspects of the benefits of comprehensive utilization. Currently, in hydroelectric station projects where power generation is the main concern, where the investor organization is in the electric power industry, and where requests for comprehensive utilization necessarily increase the construction costs of a station, if we take account only of the construction cost of the station per kilowatt generated, we might reject projects which would produce large benefits from comprehensive utilization. In Europe, the United States and Japan, joint investment is used in the case of projects involving comprehensive utilization. For example, the investment in the Tedorigawa No 1 hydroelectric station project in Japan was shared among three departments: 45 percent of the investment was for power generation and was borne by the power development company, flood protection accounted for 33 percent of the investment, which was borne by the Ministry of Construction, and water supply accounted for 22 percent of the investment, which was borne by Ishikawa-Ken. If our country too were to implement shared investment in the case of comprehensive-utilization projects, the construction cost of hydroelectric stations would be decreased and the various departments would be aided in rational planning of the scale of the project.

To summarize the foregoing, by taking account of all factors and making a comprehensive analysis, we can gain a much clearer idea of the position which a hydroelectric station occupies in the power system and in comprehensive utilization of rivers and streams, as well as of its economic benefits, and can make the major effects of the station on power construction more evident, which helps the planning departments to consider how large a station should be built, at what locality and at what time. Currently, many economic comparison methods are used in this country and abroad to evaluate power production projects; we must develop a computation method which is well suited to this country's circumstances.

This country has rich coal and water-power resources, but they are unequally distributed geographically, and in electric power construction the emphasis must be placed on working out a rational distribution so as to arrive at the best solution for each area, to foster both hydroelectric and fossil-fired power and to make them complement each other. For example, there are plentiful water power resources in the northwest and north China and on the upper and middle reaches of the Yellow River, while coal is plentiful in Inner Mongolia, Ningxia and Shanxi, and if we were to build a series of large and medium-size hydroelectric stations on the upper reaches of the Yellow River and a series of large and medium-size fossil-fired stations in Inner Mongolia, Ningxia and Shanxi, we sould connect them into the Northwestern and North China power grids, transmitting hydroelectric power eastward and fossil-fired power westward. Again, we could build large-size fossil-fired stations in Henan and large hydroelectric stations in Hubei and Hunan and connect them into the Central China power grid, making the hydroelectric and fossil-powered sources in the southern and northern sections complement each other. Furthermore, Guizhou has both coal and water power, Guangxi has water power but lacks coal, while Guangdong is short on energy resources; if Guizhou's hydroelectric and fossil-fired stations were netted together with Guangxi's hydroelectric stations, large quantities of electric power could be transmitted to south China. Further off, we could also consider using superhigh voltage transmission lines to transmit power from powerful sources in the southwest and northwest of the country to east China and the northeast. The construction of a large power grid could make even better use of hydroelectric power's and fossil power's ability to complement each other and overcome their shortcomings. When developing long-distance electric power plans, more study should be devoted to such overall strategic questions so as to develop power production systematically and in planned fashion over the course of years and to enable this country's power production to adapt to the requirements of the four modernizations.

Improvements in Arch Dam Design Suggested

Beijing SHUILI FADIAN [WATER POWER] No 6, Jun 81 pp 3-4

[Summary of the Concluding Report in the Symposium of High Arch Dams by Ma Junshou [7456 0689 1108]: "Strengthen the Study of Arch Dams to Upgrade Design Standard"]

[Text] A symposium on high arch dams was held by the China Hydroelectric Engineers Association in Chengdu in November, 1980. Special topics talks were given and broad discussions were held in the conference and in group meetings on problems of arch dam stress and layout selection, abutment stabilization and overflow energy dissipation. The opinions and suggestions are summarized as follows.

(1) Stress analysis and layout design.

1. The principal methods currently employed in China for arch dam stress analysis are the trial-load method and the three-dimensional finite element method. It was suggested in the discussions that boundary condition studies and comparison analysis of these two methods should be strengthened so as to improve their accuracy and reliability. In the meantime, work should progress toward the investigation of nonlinear problems and other complex configurations such as considering concrete fracture factors in the trial-load method and taking fracture and engineering procedure into account in the finite element method. It was suggested that when the trial-load analysis leads to local weakness belt in the arch dam foundation, it should be supplemented by model tests or three-dimensional finite element analysis in order to obtain better results.

2. Allowable stress and safety factor of the arch dam concrete are important factors affecting the engineering safety and economic rationality. The allowable stress value presently used in China is somewhat different from that used by other countries, and strengthening of the analytical research in this area was recommended. Work should also be carried out on how to make the allowable stress compatible with stress analysis methods.

3. In the stress analysis of arch dams, the large effects of construction work and earthquake on the stress should not be neglected and a broadened research on load was recommended.

4. Layout has an important influence on the body stress and abutment stability of the arch dam and research in this area should be strengthened. For example, the arch section needs not be restricted to a circular arc and the cantilever section can also have other appropriate shapes.

5. There are many computer programs in China for analyzing arch dam stress, but they are not unified, mostly not evaluated, and some require excessive preparatory work. It was recommended that the responsible departments should organize the effort and establish a reliable universal program that meets the current needs in China as soon as possible.

6. Optimization of the arch dam layout design is the direction for future development. It is characterized by the extensive use of computers and is capable of

obtaining a correct layout plan for the body model within a short time period. It reduces the work volume of design computation, speeds up the design progress and decreases engineering volume as well. Research in this area should be strengthened in the future.

7. Research on arch dam dynamic analysis should be reinforced in order to meet the needs of building arch dams in earthquake zones.

(2) Abutment stability and foundation treatment

Abutment stability is the basis for arch dam safety and is of extreme importance. The stability analysis involves many factors, all requiring further study.

1. Based on dam engineering experiences accumulated here and abroad and according to the current situation in China, the rigid body limit equilibrium method is still the principal method of abutment stability analysis at present. The equatorial plane projection method developed on this basis can also be pursued further. Due to the intrinsic limitations of these abutment stability analysis methods, they may not be completely valid for complex foundations that deviate substantially from the rigid body assumption, or for foundation with glide planes having complex spatial geometry (for example, staircase glide plane or multiple glide planes). In such cases, other appropriate methods should be sought, or studies can be conducted through experimentation and supplemented by finite element analysis.

2. In the long run, it is essential to carry out elastoplastic finite element analysis and experimental investigation on complex foundations or foundations with local weakness zones. A reasonable method for abutment stability analysis can also be explored by incorporating the fracture mechanism in rock mechanics.

3. Experimental analysis and research work on factors having great effects in abutment stability analysis, such as reaction force systems, various parameters, and the spatial distribution of structure surfaces, should be strengthened and their use should be selected with care.

4. In addition to computational analysis, reinforcement measures proved to be effective in the past should be considered when necessary in order to improve the abutment stability. More emphasis on this activity was recommended.

(3) Discharge energy dissipation and joints layout

1. Most of the high arch dams in China are built in deep river valleys where the volume of water flow is great, riverbeds are narrow and joints layout is difficult. Also, in regard to the energy dissipation aspect, there exist different degrees of washout problems of the downstream riverbank and riverbed which could affect the bank stability and cause abutment instability and high tailwater level. Attention should be paid to such problems. The drop point of overflow over the crest of a double-curvature high arch dam is usually close to the downstream toe of the dam, thus making the energy dissipation problem even more acute and may also lead to vibration problems. The discharge energy dissipation and overtopping impact problem should therefore be considered carefully and studied together with abutment stability and joints layout.

2. In order to solve the problems of the narrow river valley at the dam site, centrally converging overflow water and the large single width flow volume, further investigation should be made on the various spillway layouts currently under study, such as, energy dissipation via overflow collision, slotted bucket, spillway incorporated with powerhouse, and ski jump overflow powerhouses.

3. To solve the overflow problems of high arch dams, the hydraulic problems in high waterhead overflow such as turbulent boundary layer and gas admixture should be studied further. More advanced studies of the spillway surface curvature are also recommended.

(4) Some design questions of the Ertan arch dam

In the meeting, Chengdu Institute of Survey and Design presented the design of Ertan arch dam and the problems existing in the design. Group discussions were subsequently conducted and the following opinions were put forth for consideration:

1. In addition to analyze the abutment stability using rigid body limit equilibrium method as the principal method of analysis, it was also suggested that an integrated study should be made in which other methods such as finite element method and fracture mechanics analysis are incorporated. In the analysis, all the detrimental factor should be given full consideration so as to insure safety. In selecting the glide boundary, combinations of different structural surfaces should be considered in order to avoid neglecting the most unfavorable combination. It was recommended that equation used in the computation should be based principally on shear forces and the employed safety factor also deserves further studies.

2. Because of the great height (240 meters) and the large reservoir of Ertan arch dam, and because there are major local geological structures nearby, adequate attention should be placed on aseismic problems, including dam induced earthquake. More efforts on the research of dynamic analysis were suggested.

3. Assuming the engineering quality can be maintained, the current standard of allowable stress is appropriate. Stress analysis, however, can be carried out to a greater detail. For example, more efforts can be directed toward the investigation of boundary effect and influences of cracks. Body stress obtained by trial-local method near a weak zone of the foundation rock may tend to be too large, results by model tests and finite element method are probably more reasonable.

4. It was suggested that joint layout and overflow energy dissipation should be further investigated in order to come up with more mature proposals.

5. The success or failure of the engineering project depends on the crucial work of early phase survey or design to obtain reliable first-hand survey and test data. Inadequate survey, study, and design will prevent the technical measures from being placed on a solid basis and will inevitable lead to waste and loss due to redundances in the project and even affect the safety of the construction. Lessons learned in the past in this area should be well heeded. As compared to the investment made on the construction engineering project, costs of the early phase work constitute only a small percentage and yet it has profound effects. Attention to the early phase effort is called for.

6. In the design of high arch dams in foreign countries, great emphasis is placed on the foundation treatment. It was recommended that foundation treatment be made an important component of the preliminary design. The deformation modulus and condition of the foundation should be improved by treatment procedures in order to strengthen the abutment stability. For the Ertan dam project where the dam height and the ground stress are both large, great emphasis on foundation treatment is recommended and necessary investigative testing and design should be conducted.

7. Strength of the dam material is of vital importance for a high arch dam like the one planned for Ertan. Studies of material properties are therefore recommended. Assurance and improvement of the construction quality are of extreme importance and deserve great attention. The consequences are extremely serious if the construction quality of such a high arch dam cannot be guaranteed.

(5) The question of establishing China's arch dam design code

Up to now, China still has not established its own arch dam design code and designs are often conducted according to the design code of gravity dam and foreign data. This situation is not at all conducive to the current needs of arch dam construction. A Chinese arch dam design code is being drawn up in a joint effort of the Eastern China Institute of Survey and Design of the Ministry of Electric Power Industry and other units. This effort is highly significant in consolidating the arch dam construction experience in China and in promoting the building of arch dams. The responsible departments are urged to grasp this project well and other units are urged to lend support wherever possible so that the code can be compiled, certified and issued at the earliest possible date.

Substation with Double Bus Bar Junction

Beijing DIANLI JISHU [ELECTRIC POWER] in Chinese No 8, 5 Aug 81 pp 30-34

[Article by Lan Zengjue [5663 1073 3778] of the Beijing Electric Power Design Institute: "Analysis and Comparison of the Design Scheme for a Double Bus Bar Junction in Four Sections and a 500 KV One and Half Circuit Breaker Junction"]

[Text] In recent years, our nation began to design a batch of master junctions of 500 KV for power distribution installations. Even though many types of 500 KV master junctions are produced abroad, but according to the actual situation in our nation, only two basic junction schemes, the one and a half circuit breaker junction and the double bus bar junction with bypass in four sections are used. This article takes the Fangshan 500 KV Transformer Substation as an example to analyze and compare these two schemes and to evaluate them.

The scale of the 500 KV power distribution installation of the Fangshan Transformer Substation is: 6 loops of output lines (including two loops of double circuit output lines), 2 master transformers, totaling 8 components.

When using the one and a half circuit breaker junctions, they can be organized into 4 series. To prevent simultaneous power outage of components of the same name (double circuit output line or master transformer), three principles have been taken into consideration in forming the series: (1) the components of the same name are distributed on different series; (2) the components of the same name are separately connected to different bus bars; (3) if one series is fitted with two lines, the power source line and the load line are coupled to form one series. The actual junction is illustrated in Diagram 1.

3. No 2 master transformer
4. A_1 line
5. A_2 line
6. B line
7. C_1 line
8. C_2 line
9. D line

When using the double bus bar junction with bypass in four sections, to prevent simultaneous power outage of the components of the same name, components with the same name must be separated and distributed evenly on the two sides of the sectional circuit breaker of the bus bar. The actual junction is illustrated in Diagram 2.

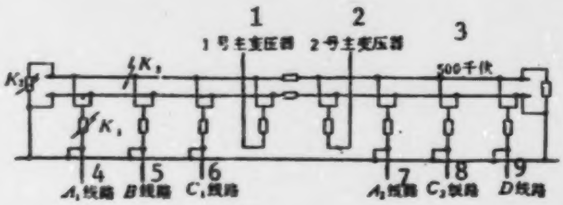

Diagram 2 The double bus bar junction with bypass in four sections

5. B line
6. C_1 line
7. A_2 line
8. C_2 line
9. D line

I. Criteria of Reliability and Analysis

The transmission capacity of the 500 KV line is generally 1,000,000 to 1,200,000 kilowatts, the capacity of the master transformer is generally 500,000 to 750,000 kilovolt-amperes. Power outage on any line or any one of the master transformers will greatly affect the system. Therefore, when determining the main 500 KV electrical junction, it must be safe and reliable, and at the same time, it must satisfy the demands for easy inspection, repair and operation, versatile management, less investment and less space. Taking these demands as the basis for designing the 500 KV master junction, we have the following quantitative criteria for reliability:

1. When a breakdown of the circuit breaker (except the bus connection or sectional circuit breaker), the bus bar, line or transformer components occurs, the scope of power outage does not surpass 1/4 to 1/3 of all components.

2. When a breakdown of the bus connection or the sectional circuit breaker occurs, the scope of power outage does not surpass 1/2 of all the components.

3. When inspecting the equipment, breakdown of any component will not cause a total power failure.

The reliability of the two types of junctions is concretely analyzed according to the above reliability criteria:

1. One and a half circuit breaker junction. We know from Diagram 1 that when the equipment is not inspected, the scope of power outage due to a breakdown of the communications circuit breaker is 1/4 of all components. When the bus bar malfunctions, power shutdown is unnecessary. When the communications circuit breaker is inspected and repaired, the scope of power outage due to the breakdown of the bus bar circuit breaker is 1/4. The scope of power outage of a breakdown of the bus bar is 1/8. When a group of bus bars are inspected and repaired, the scope of power outage of a malfunctioning circuit breaker is 1/4. When another group of bus bars malfunctions, under the condition of a looped system, a shutdown of power is not necessary.

2. The double bus bar junction with bypass in four sections. It can be seen from Diagram 2 that when no equipment is being inspected, the scope of the power outage due to a malfunctioning line, master transformer, bus connection or sectional circuit breaker is 1/4 to 1/2. The scope of a power outage of a malfunctioning bus bar is 1/4. When the output line circuit breaker is being inspected and repaired, the scope of a power outage of a malfunctioning line or a sectional circuit breaker is 3/8 to 5/8. The scope of a power outage due to a malfunctioning bus bar is 3/8. When a group of bus bars is being inspected and repaired, the scope of a power outage due to a malfunctioning circuit breaker is 1/2 to 3/4. The scope of a power outage of a breakdown of the bus bar is 1/2.

The above analysis shows the comparative reliability of the two design plans described as follows:

1. When the circuit breaker breaks down, under a one and a half circuit breaker junction, the scope of a power outage does not exceed 1/4, and there are no components of the same name. The scope of a power outage of the double bus bar junction with bypass in four sections is 1/4 to 3/4. When the sectional circuit breaker malfunctions at the same time when a group of bus bars is being inspected and repaired, the scope of a power outage will reach 3/4, including components of the same name.

2. When the bus bar breaks down, the one and a half circuit breaker junction generally does not undergo a power outage. In very individual cases, the scope of a power outage is 1/8. The scope of a power outage of the double bus bar junction with bypass in four sections is 1/4 to 1/2.

It can be seen that the reliability of the components of the equipment of the one and a half circuit breaker junction is higher than the double bus bar junction with bypass in four sections.

II. The Power Distribution Installation and Analysis of the Structure

One and a half circuit breaker junction. According to the different positions of the three circuit breakers in one series, there are three schemes.

1. Three row scheme Two sets of bus bars are placed at the two ends, in the center, three circuit breakers are lined up in three rows, the single line position diagram is shown in Diagram 1. The dimensions of the power distribution installation is 302 meters long, 246 meters wide, the longitudinal dimension is greater. It is mainly suitable for side output lines. When output lines have to be in one direction, one series occupies two spaces, increasing the area required.

2. Flat ring scheme Two sets of bus bars are placed next to each other with a communications circuit breaker placed horizontally between the two. The three circuit breakers form a "loop", its single line position diagram is shown in Diagram 3.

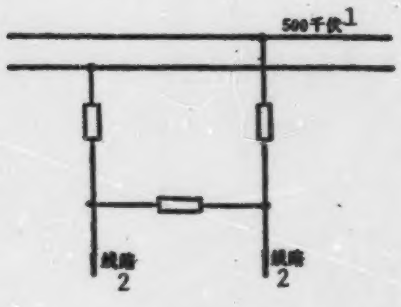

Diagram 3 Single line illustration of the flat ring scheme of the one and a half circuit breaker junction

1. 500 KV
2. lines

The dimensions of the power distribution installation is 222.5 meters long, 332 meters wide, the longitudinal dimensions are smaller, it can simultaneously provide output lines on one side or on opposite sides and it is more versatile.

3. Single row scheme Two sets of bus bars are separated, utilizing an upper layer slanted lead wire to connect the three circuit breakers positioned in one row into a series, its single line position diagram is shown in Diagram 4.

The dimensions of the power distribution installation is 211.5 meters long, 396 meters wide, and the scheme is also relatively versatile.

The three schemes described above can be used in the order of geographic positions in different series for double circuit output lines without requiring crossover and they can match the output lines in a versatile manner.

Analysis of the structure of the power distribution installation shows that each circuit of the one and a half circuit breaker junction requires only one set of bus bar isolating switches to connect with the bus bar. Selecting the type of isolating switches is easy. The power distribution installation can use the single layer frame. The pull on the lead wire is small and the structure is simple. Most of the circuit breakers of the flat ring and triple row schemes do not have live lead wires above them, and during inspection and repair of the circuit breakers, the influence of electrostatic induction is small. In the single row scheme, all circuit breakers have slanted lead wires above them, and this is unfavorable to inspecting and repairing the circuit breakers.

Summarizing the above, we see that the three schemes of positioning these types of junctions can separately suit the different overall schemes, and they have the advantage that the double circuits do not need crossovers, the positioning is versatile, the structure is simple, and inspection and repairs are convenient.

The 6 loops of output lines of the 500 KV power distribution installation of the Fangshan Transformer Substation exit in the same direction. There is a large and relatively deep trench in the direction of the output line near the transformer substation. The longitudinal dimensions of the power distribution installation must be relatively small. According to the above analysis, the flat ring scheme was used.

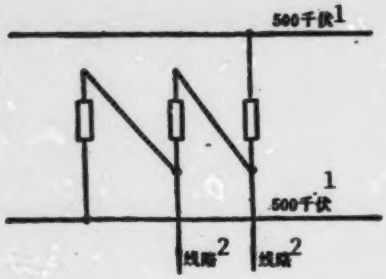

Diagram 4 Single line position diagram of the single row scheme of the one and a half circuit breaker junctions

1. 500 KV
2. Lines

The double bus bar junction with bypass in four sections. To conserve space, generally the single row scheme is used for positioning the circuit breakers, its single line position diagram is shown in Diagram 2. The dimensions of the power distribution installation is 201 meters long and 426 meters wide. Because the frame of the 500 KV power distribution installation is high, the influence of electrostatic inductance is great, and because the bus bar must be divided into four sections, there are three major problems in distribution and structure:

1. Because each circuit requires two sets of isolating switches in parallel connection with the bus, if the ordinary single row positioning on a double layer frame is used, the hanging point of the lead wire on the upper level reaches 35 meters, and at the same time, during inspection and repair, the problem of electrostatic induction is outstanding and with 500 KV, inspection and repair are difficult. Therefore, we can only use the keel type positioning on a single layer frame. At this time, we must use the scissor isolating switch and the selection of the type must be strict. At the same time, to assure reliable operation, we must also use a bus with a large tension and a small arc, thus the structure of the frame of the bus bar is complex, and the positioning scheme is singular and not versatile enough.

2. Because the double circuit lines cannot avoid output line crossovers (there are two crossovers in this case), the line structure requires setting up crossover towers of 40 meters high, causing difficulty in operation, inspection and repair and requiring construction in stages.

3. When the scale of expansion is not clear, the positioning of the sectional circuit breakers is more difficult, easily causing the sectional circuit breakers to be positioned on one side.

III. Economic Comparison

Economic comparison includes mainly the comparison of equipment costs and space. Because the master transformers and the electrical reactors of the two types of junction schemes are entirely the same, they will not be considered in the economic comparison. Only comparable equipment are compared. The economic comparison of the two types of junction schemes are listed in the table.

We know from the table:

1. The cost of the main equipment of the two types of junctions are almost the same, the one and a half circuit breaker junction is lightly more expensive (by 210,000 yuan, constituting 8 percent of total cost).

2. The area of land occupied by the one and a half circuit breaker junction is 80.6 percent of that required by the double bus bar junction with bypass in four sections, conserving 24.9 mu of land.

Economic Comparison of the Two Types of Junction Schemes

IV. Technical Analysis

1. One shot operation, inspection and repair of equipment

One and a half circuit breaker junction. The isolating switch serves only as the isolating device, and it does not require reverse gating operations. In handling accidents, the circuit breaker can be utilized in operation and elimination of accidents is quick. At the same time, because the circuit breaker does not require a substitute circuit for operation, it can be shutdown at anytime for inspection and repair, and defects can be discovered in time and corrected in time, assuring that the circuit breakers are in good operating condition. Its one shot operating equipment is simple, operation is convenient, and the conditions for inspection and repair of the equipment are good.

The double bus bar junction with bypass in four sections. The isolating switch requires massive reverse gating maneuvers, easily causing accidents. At the same time, when handling accidents, operating the isolating switches is required and the speed is slow. When inspecting and repairing the circuit breakers, operation of relatively complex substitute circuits is required. Because there are only two circuit breakers serving as bypass circuits and concurrent bus connections, turnabout is not possible, affecting inspection and repairs. Therefore, its one shot operating equipment is complex, easily causing accidents, and inspection and repair of the equipment are inconvenient.

2. Relay protection of secondary line operation, inspection and repair

(1) One and a half circuit breaker junction

Line protection. The protective installation is connected to the two sets of current transformers. Because of the differences in the characteristics of the current transformers, when a nearby external breakdown occurs, the protective installation might misfire, and closing and locking circuits to prevent misfiring must be added. At the same time, when each series of the communicating circuit breakers refuses to operate, and to enable the opposite circuit breaker of another line in the same series to jump the gate, a distant jump gate device that is highly resistant to interference must be installed, thus complicating the protective device. When inspecting and repairing the protective device which is duplicated and which can be separately shutdown for inspection, it is rather difficult to test the drive of the circuit breaker.

Protection of the bus bar. Devices for single bus differential protection are simple in structure. When the bus bar protection device misfires, it jumps the circuit breaker of the main bus bar and the components will not shutdown. Inspection of the protective device can be done by shutting down one bus bar. At this time, if the other bus bar malfunctions, this will only bring about released row operation, power outage will not occur and the affect is small.

Protection against malfunction of the circuit breaker. The starting circuit consists of protective exits connected to two components and its own discriminating components. At the same time, it must use voltage discrimination components. The protective device and the voltage cutover circuit are more complex.

Current and voltage circuits. The current circuits of the protective devices of the instruments and the lines of the components must all be connected to the two sets of current transformers, cross connections are more complex, but the current circuit of the protective device of the bus bar has fixed connections and is relatively simple. The voltage circuits of each component are connected to the dedicated voltage transformer and do not require cutover, and thus they are relatively simple.

Controling and interlocking circuits. Because the isolating switch does not require reverse gating operations, there is no interlocking reverse gating between the components of the circuit breaker and the isolating switch, and thus the interlocking circuit is relatively simple. The controling circuit is more complex because the communicating circuit breaker is controlled by two components.

(2) Double bus bar junction with bypass in four sections

Line protection. The protective device is connected only to one set of current transformers, and at the same time, the line circuit breaker is completely connected to the bus bar, and the problems requiring protection against misfiring and the installation of distant jump gate devices that are highly resistant to interference do not exist. When inspecting the protective devices, the bypass circuit breaker can be utilized as a substitute circuit or the method of separate shutdown can be used. This is more convenient.

Protection of the bus bar. Because the bus bar is divided into four sections, there are more ways of operation, but the installation of two sets of structurally complex bus bar differential protection devices is required. At present, the commonly used specific phase bus bar differential protective device for double bus bars cannot be utilized yet. When the protective device of the bus bar misfires, 1/4 of the components will suffer a power outage. When inspecting the protective devices, one half of the bus bar loses its protection, and at this time, a breakdown of the bus bar will cause 1/2 of the components to suffer a power outage. The effect is great.

Protection against malfunction of the circuit breakers. For all circuit breakers of every component, the starting circuit requires only that the exit of the protective device of the component is a one-way output, and thus the protective device is much simpler. But, the bus bar connection, the sectional circuit breaker and the one and a half circuit breaker junction are the same, they must have two conditions to form the starting circuit, therefore their protective devices are still complex.

Current and voltage circuits. These are connected only to one set of current transformers and are relatively simple. The current circuit protecting the bus bar must follow the components that reverse the bus bar and correspondingly cutover, therefore it is more complex. The voltage circuits of each component must also cutover and are more complex.

Controling and interlocking circuits. There is operational interlocking and also reverse gating interlocking between the components of the circuit breakers and the isolating switches. At the same time, the circuit breakers also functions as the bus connection, bypass and sectional circuits, and the bus bar in four sections possesses various operating modes, thus, the interlocking circuits are very complex. The controling circuit is relatively simple because each component corresponds to one circuit breaker.

According to the above analysis, the degree of complexity of relay protection and of the secondary lines of the two types of junction schemes are basically equal.

3. Versatility for Expansion

One and a half circuit breaker junction. At the beginning, the output line circuits are few in number and when this remains so for a long time, simple angular connections must be used for transition, preventing the bus bar from forming series for a long period, and the advantage of this type of a junction cannot be fully developed.

At the same time, during the course of expansion, one-shot connections must be changed, and transition of secondary lines is also relatively complicated.

The first phase construction of the 500 KV power distribution installation of the Fangshan Transformer Substation had only three components, i.e., two loops and one set of master transformers. To overcome the above shortcomings, the plan to position the lines, transformer components and circuit breakers in two series in their final positions was adapted. One loop of the lines and one set of the master transformers formed a complete series, the other loop of the lines used double circuit breakers (one bus bar circuit breaker, one communicating circuit breaker) to form an incomplete series, thus avoiding changing the one-shot system during expansion. At the same time, terminal boxes were set up beside the current transformers of the communicating circuit breakers. The design of secondary circuits utilized measures of separation and independence so that expansion was relatively convenient.

Double bus bar junction with bypass in four sections. During expansion, the line or the transformer can be taken as a unit and can be independently installed, not affecting other circuits. This is more convenient.

V. Conclusion

Summarizing the above, we see that the design schemes of the one and a half circuit breaker and the double bus bar junction with bypass in four sections are respectively suitable for use under different conditions. Our nation's 500 KV power distribution installations will use these two types of junctions as the basic forms for connection and they will coexist.

1. The Fangshan Transformer Substation's 500 KV power distribution installation has used the one and a half circuit breaker junction scheme. It occupies less land, its reliability is higher, operational inspection and repairs are convenient, its structure is simple, the double circuit output lines do not create crossovers, positioning is versatile, it fits the topography well, and with such advantages, it is a better junction scheme.

2. The scope of suitable application of the one and a half circuit breaker junction

(1) Its scale is 4 to 6 loops of output lines, 2 sets of master transformers;

(2) The output lines have a double circuit line, and at the same time, the lines must exit in all directions, and the conditions for positioning are more difficult;

(3) At the beginning period of construction, the number of output line circuits is few, they last for a short time, and they possess the conditions for forming two series quickly.

At this time, the increase in the investment of this type of junctions is very small, and the advantage is that such junctions can be fully developed and they are more suitable. But when the number of output line circuits is too small, the two sets of bus bars cannot form a loop, and the advantages of the one and a half circuit breaker junctions cannot be developed. When there are too many output line circuits, the investment is too great and they are unsuitable.

3. The applicable scope of the double bus bar junction with bypass in four sections

(1) The scale is 8 to 10 loops of output lines, 3 to 4 master transformers;

(2) The output lines do not have double circuit lines, or even if there are double circuit lines, geographically, they possess the conditions for exiting in the opposite direction to the power distribution installation;

(3) The scale of construction in stages is more obvious.

At this time, the shortcomings in the positioning of this type of junctions can be overcome while the advantage of less investment is more outstanding, thus they are suitable for use.

Science, Technology Lead Hydropower Development

Beijing GUANGMING RIBAO in Chinese 11 Sep 81 p 3

[Article by Pan Jiazheng [3382 1367 6927], member of the Academic Department of the Technology and Science Department of the Chinese Academy of Sciences and Assistant Chief Engineer of the General Bureau of Hydroelectric Power of the Ministry of Electric Power: "Science and Technology Lead the Development of Hydroelectric Power"]

[Text] Our nation's deposit of hydroelectric resources is rich. According to the general national survey conducted between 1977 and 1980, it amounts to a total of 680 million kilowatts, of this, 370 million kilowatts can be developed, ranking first in the world. Since liberation, we built hydroelectric power stations with a capacity of 16.87 million kilowatts (referring to those with a capacity of over 500 kilowatts as of the end of 1980). Large achievements have been realized but these achievements constitute less than 5 percent of the amount that can be developed. Therefore, the development of hydroelectric power in a big way in the future has an important strategic meaning in solving our nation's energy problems and hastening the building of the four modernizations.

Recently, there have been more and more articles and opinions introducing the richness of our nation's hydraulic resources, describing the superiority of developing hydroelectricity and studying its economic gain and its investment and returns. This is a good phenomenon. But, we must also see the other side of the problem. That is, when we develop hydroelectric resources, we will face a series of difficult scientific and technical problems. Their degree of difficulty and complexity may be rare in the world. To develop hydroelectric resources in a massive way without studying and solving these problems is just empty talk. Solving these problems will bring our nation's hydroelectric construction and the level of hydroelectric science and technology to the front ranks of the world.

What are the difficulties and complex problems that have to be solved when developing our nation's hydroelectric resources?

First, viewing the geological conditions, many of our nation's large power stations will be built on violent earthquake regions, even near the dam sites, there are large active faults passing through. Among the hydroelectric power stations already built in our nation, phenomena of reservoir induced earthquakes have already occurred. This requires organizing geophysicists and earthquake resistance specialists to profoundly study the mechanism and the frequency of earthquakes, to predict their intensity, to study accurate and effective methods of dynamic analysis and propose corresponding measures.

Landslides caused by large reservoirs filled with water have reached a magnitude of several hundred million cubic meters in scale. The analysis, prediction, prevention and control of this type of damaging landslides are also problems that are far from being solved.

In the regions of concentrated hydraulic resources in our nation, there are many high mountains and deep valleys. In topographic conditions, they are good dam sites. But construction is difficult, especially the geological conditions are frequently more complex. For example, there are serious tectonic fragmented belts passing through, some river beds are covered by sand pebbles over 100 meters thick, they must be surveyed and analyzed by advanced technology so that effective and feasible treatment and measures can be carried out. We still lack experience in these aspects.

Second, in building construction, because the scale of the hydroelectric power stations is becoming larger and larger, extremely large structures of hydraulic engineering will have to be built, for example, especially tall dams, extra large underground tunnels, tubes that can bear extremely high pressure, digging long water conducting tunnels under tall mountains, etc. The continued enlargement of the scale of buildings will bring new topics of study in their surveying, design and construction, including topics in materials, structures, hydraulics and construction engineering. Simple dependence on engineering experience to design and to construct such buildings will gradually fail to adapt to the needs of huge construction projects. The practical situation requires us to propose more precise scientific data, and even to carry out some revolution. We must organize experts in applied mechanics, computational mathematics, hydraulics, rock mechanics, building materials to cooperate together and to create new ways.

Third, our nation's major hydraulic resources are distributed in the southwest and the northwest, especially concentrating in the southwestern border regions, very far from the region of major load. For this, we must solve the problem of long distance (over 1,500 kilometers to 2,000 kilometers) and large capacity (several million to several dozen million kilowatts) ultrahigh voltage power transmission (including high voltage equipment, direct current transmission of power, system stabilization and a series of problems). Future construction of large hydroelectric power stations also requires us to develop generators with a single generator capacity reaching the million kilowatt class and corresponding equipment. This again brings out many new topics in materials, structure, cooling and manufacturing technologies.

Fourth, building hydroelectric power stations requires flooding some land. Some hydroelectric power stations even require flooding large areas of cultivated land, forming large reservoirs of several dozen billion cubic meters. In our nation with more people and less land, this will greatly increase the building cost of the power station and will also bring about a series of economic and social problems. Therefore, the building of some hydroelectric power stations has not been included in the daily agenda. Here, we are presented with a problem: Can the broad expanse of water surfaces provide food and other materials for living equivalent to the cultivated land? From the viewpoint of "cosmic food grains" this should be possible. In the past, because of insufficient emphasis on this question, a systematic study of the problem was not carried out, thus, the presently available several dozen million mu of water surface of the reservoirs have not been comprehensively utilized well. In addition, the building of large reservoirs will cause profound and far reaching effects in the environment. There are benefits and disadvantages. We must organize scientists in biology, ecology, aquatic products, mud and sand and environmental protection to carry out detailed research and experiments.

The many problems and difficulties mentioned above are not aimed at discouraging the building of hydroelectric power, conversely, they are for more hydroelectric power construction. To develop our nation's rich hydraulic treasures, we must pragmatically solve these difficulties in science and technology and place this work before construction. Some work require a long period of hard study before they can produce visible results, if we do not start now, "digging wells when thirsty" will not solve the problems. For this, we suggest selecting two or three rivers that are suitable in location and in size and that are connected with the above problems, such as the upper reaches of the Huanghe, the Hongshui river in Guangxi, Yalongjiang in Sichuan (each has a capacity of over 10 million watts, the electricity generated can be distributed separately to northern China, southern China and central China) as the sites for near term development and study. Scientific research, survey and design and construction must be organized according to plan and step by step to accumulate data and experience and to establish a firm foundation for the further development of our nation's hydraulic resources on an even larger scale.

Miaotiao River Hydroelectric Cascade

Beijing SHUILI FADIAN [WATER POWER] in Chinese No 7, 12 Jul 81 pp 50-51, centerfold

[Article by Liu Yizhou [0491 5030 3166], Survey and Design Institute, Engineering Bureau No 9, Ministry of Power: "An Introduction to the Miaotiao River Cascade of Hydroelectric Stations"]

[Text] The Miaotiao River is a tributary flowing into the Wujiang River from the south and forming part of the Yangtze River system. It has a total length of more than 180 km and a head of 549 meters, with an average rate of fall of 0.305 percent. It drains an area of 3,113 square kilometers. Its upper reaches are in a hilly region, while in its middle reaches the hills change to mountains, and its lower reaches are in an area of high mountains and narrow valleys, with terrain variations of 300 to 400 meters. The average air temperature in its valley is 13.8°C and the average rainfall 1,300 mm. The river has been developed in a six-level cascade (see figure) in which the individual levels are interconnected; the total utilized head is 384.5 meters, and the total equipment capacity is 239,000 kW.

Fig. 1. The Miaotiao Cascade of Hydroelectric Projects

Key:

1. Level 1: Hongfeng Hydroelectric Station, 86 km.
2. Level 2: Baihua Hydroelectric Station, 60 km.
3. Level 3: Tiaowen Hydroelectric Station, 43 km.
4. Level 4: Zhaixiangkon Hydroelectric Station, 38 km.
5. Level 5: Honglin Hydroelectric Station, 23 km.
6. Level 6: Hongyan Hydroelectric Station, 13 km.

The valley has an extremely complex geologic structure, more than 70 percent of which consists of carbonate rock, with extensive karstification, producing problems of seepage from reservoirs and problems of foundation stability of hydraulic engineering works. To deal with this problem, the relevant design and construction organizations have used such methods as enclosure, plugging, grouting, paving and damming, in accordance with specific local topographic, hydrologic and geological conditions; starting in 1958 they have built six different hydroelectric stations with dams of different design and have accumulated invaluable experience in dam construction in karst regions. Below we give a brief introduction to the construction of the six power stations in the cascade.

Level 1: The Hongfeng Station

This station is located 35 kilometers southwest of Guiyang City. The regulated area of the reservoir is 1,551 square kilometers, equivalent to 50 percent of the total length of the river, making it the largest reservoir in the cascade, with a total capacity of 601 million cubic meters. The total amount of construction earthwork was 492,000 cubic meters, and 55,400 cubic meters of concrete was emplaced.

The geology of the dam area is Triassic Qingyan limestone interbedded with thin layers of sandy shale, with the dip facing upstream. The pressure resistance of this shale is over 1,000 kg/cm^2 and the friction coefficient is 0.45. There are more than 20 faults of various sizes in the dam area, with fracture zones of rather limited width. The F7 fault has a maximum fault displacement of 15 meters, and consists primarily of cemented gravel, which was handled by curtain grouting.

The power station building was built at the surface of the river bank and has an installed equipment capacity of 2 x 10,000 kW. The dam is of the rockfill type with a timber facing and is 52.5 meters tall. The timber facing consists of three layers of mortise-and-tenon planking. The cushion and compression timbers are bolted into 1-meter-thick concrete. The lower part of the facing is flexibly joined to the concrete to wall to allow it to adapt to deformation of the rockfill dam. Locomotives and trucks were used to haul the rock for construction of the dam.

The project was began in 1958, and the first generating unit went into operation in May 1960, with completion of the construction work in September 1960. After the main dam was constructed, many years' monitoring indicated a maximum displacement of 30 cm and a settling of 38 cm, satisfying design requirements.

Stage 2: The Baihua Hydroelectric Station

The dam is a rockfill type with an impervious reinforced-concrete facing and is 48.7 meters high, with a reservoir capacity of 182 million cubic meters. The power house is built at ground level on the bank, and the installed equipment has a capacity of 22,000 kW (1 x 10,000 and 1 x 12,000 kW).

The geology of the dam area is Shabaowan shale 31 meters thick, underneath which is 41 meters of Changxing limestone. The shale is highly impervious to water, its pressure resistance is 150-500 kg/cm^2 and its friction coefficient 0.3 to 4.0, all of which meet the requirements for construction of a rockfill dam. However, the geological structure under the secondary embankment on the left bank has much fissuring, and the Shabaowan shale is weathered and fractured to a depth of 10 to 20 meters, allowing a serious degree of percolation, so that in addition to securing it by grouting in deep box-type holes, during construction of the dam the pervious area was walled off from the reservoir.

The construction work on the rockfill dam was basically similar to that on the first-level [Fengshui] hydroelectric station, except for the use of a rigid facing. During construction the concrete supporting layer and the rockfill were completed first, than when it was judged that the pressure would be stable when the reservoir was filled, 15 x 10 meter slabs of reinforced concrete were poured. In order to meet watertightness and deformation requirements, the seams were filled with bitumen and channel copper, making them impervious to water, the area between the facing and the supporting layer of concrete was filled with bitumen-impregnated burlap, and an articulated joint was made between the bottom of the facing and the toe wall. The earth work for this project amounted to 960,000 cubic meters, and 88,000 cubic meters of concrete was emplaced. Work began in 1960 and the first unit went into operation in June 1966, with project completion in December 1966. After the reservoir was filled, observations indicated that the main dam did not leak, and that displacement and settling were both smaller than for the first-level station.

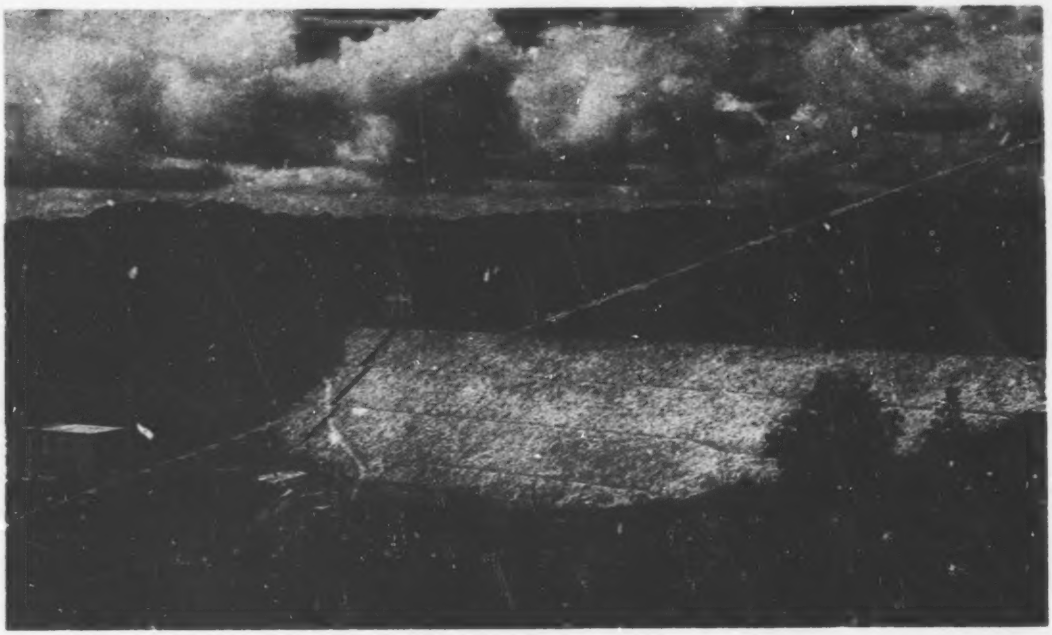

Fig. 2. The Baihua Hydroelectric Station

Third Level: Xiuwen Power Station

At the site of this dam, the river valley is narrow and U-shaped, and the dam is an arch type. The powerhouse, located behind it, has an overflow roof. The dam is 49 meters tall, 8.2^9 meters thick at its base, and 3 meters thick at the crest. The reservoir holds 11.4 million cubic meters of water and is of the daily regulation type. The power station equipment has a capacity of 2 x 10,000 kW.

The dam is built in middle and upper Cambrian dolomite dipping slightly toward the two banks and upstream at an angle of 6 to 8°, with many incompetent muddy intercalculations, and with small faults at both ends of the dam arch. The dolomite structures are extensive, and a broadened base and expanded arch abutments and anchoring fixtures were used to improve the foundation stress situation. Karstification decreased with depth, and fissuring and solution erosion of the riverbed were extensive, so that the permeability was high. A double grout curtain was used to prevent leakage in the foundation.

The left dam abutment was steep, and 80 meters of open excavation would have been required; instead, three horizontal tunnels were cut at different levels and vertical excavations conducted simultaneously, decreasing the amount of excavation work required. Weathered dolomite was made into sand for the construction work. The concrete system was applied in a downward direction, relying on the natural pressure head to introduce the curing agent. The power unit was lowered into place with a cable hoist developed for the project, thus dealing with the difficulty of building an approach road to the power house.

This dam involved 37,800 cubic meters of earth work and 49,700 cubic meters of concrete. Work was begun in 1960 and the first unit went into operation in June 1961, with project completion in July 1961. Since the plant went into operation, the overflow speed over the dam and the powerhouse has reached 17-19 meters per second, with no indication of friction damage or erosion of the concrete. Other than a few induced vibrations in the dam, no resonance phenomena have been noted, and the power station's operating characteristics have been excellent.

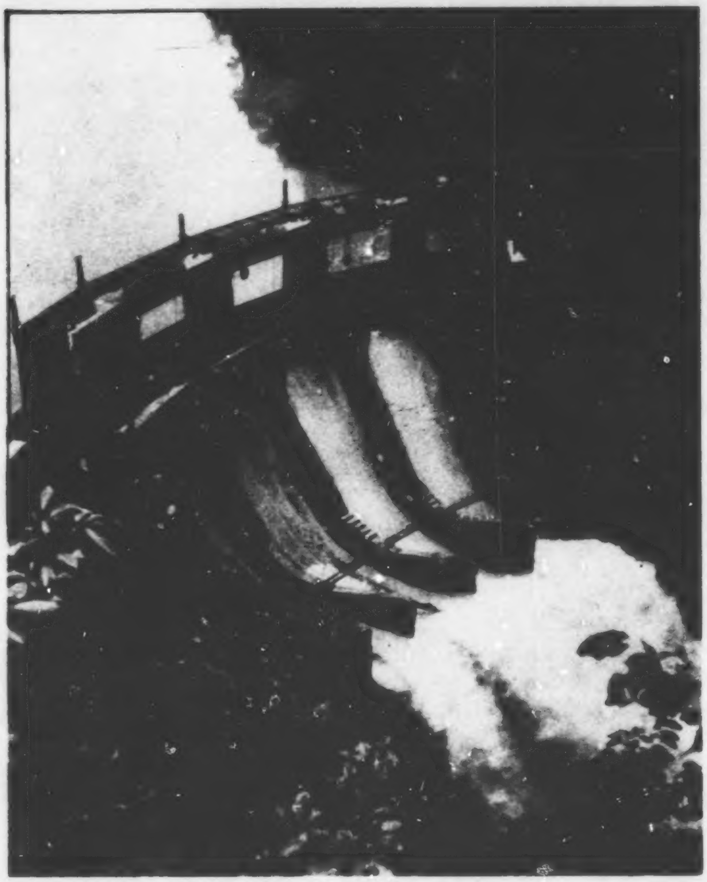

Fig. 3. The Xiuwen Power Station

Fourth Level: Zhaixiangkou Hydroelectric Station

This power station uses a double-curvature arch dam; an arched bridge spans the river and the double-curvature arch dam is built on top of it. The dam is 54.8 meters high; the reservoir contains 7.08 million cubic meters of water, and is of the daily regulation type. The power station is a run-of-river type and the machinery has an installed power of 3 x 15,000 kW.

The dam is located in a deep river gorge in which the exposed rock is Jurassic Qixia coal and Yangxin limestone. Because the right bank is affected by the F71 fault, with intense fissuring, and the rock is weathered and fractured, its strength is not uniform, and the geological conditions are complex. During construction work both open excavation and tunnel excavation were used, and when fresh rock was reached, a concrete backfill was used, on top of which a 1.6 meter layer of concrete was laid down as a dam abutment support, after which deep-hole reinforcing grouting was used on the dam. The river bed is filled with sand and gravel to a depth of up to 27 meters, and the design approach was that of construction on an uncleared foundation, which involved using an arch bridge between the two banks, on which a double-centered arch dam was constructed, while a reinforced concrete wall was used to block the water in the riverbed covering layer.

"Ski-track" spillways were used on top of the dam. In order to keep pothole formation far from the dam and to assure stability of the watertight wall, a 46.5 meter long overflow structure was added, supported by two 8 meter broad support arches, which has excellent energy dissipation capabilities.

Because this hydroelectric station's engineering structure is rather complex and the procedural requirements were rather demanding, a bypass tunnel was first cut; the holes for the waterproof wall were cut in the low-water season, and the concrete was cast underwater using reinforcing cages. The arched bridge and waterproof wall were joined by underwater slabs, and chemical grout treatment was applied to the joints between the foundations and the bridge. In the process of digging the penstock on the right bank, a sinkhole extending to the surface was found, and a supplementary arch had to be poured. Construction was begun in 1965, and the first power unit went into operation in October 1970, with project completion in July 1975. After completion of the power station, instrumental measurements and water table determinations behind the dam showed that the design of the reinforced concrete watertight wall and double-arch dam was successful, and that the quality of the construction work was excellent.

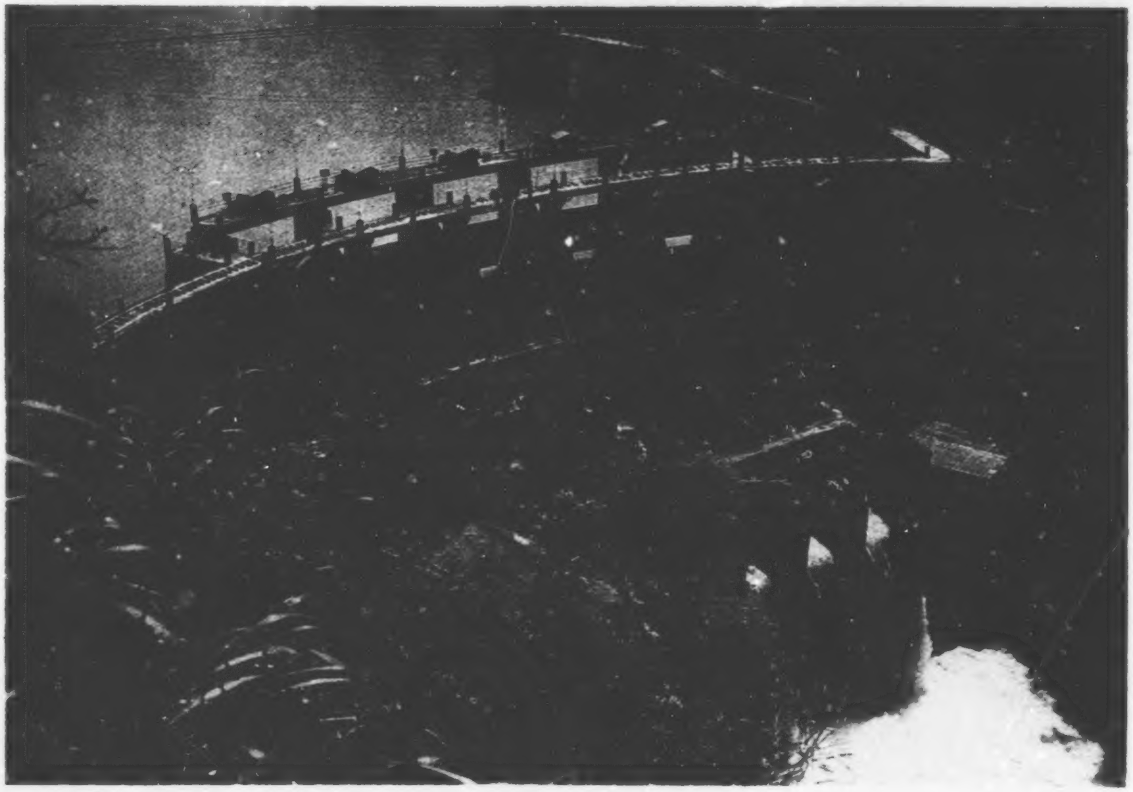

Fig. 4. Zhaishangkou Hydroelectric Station

Fig. 5. Zhaishangkou Arch Bridge

Stage 5: The Honglin Hydroelectric Station

This power station uses a gravity dam 22.5 meters high with free spillover at the crest of the dam. The reservoir capacity is 770,000 cubic meters, and there is no regulating function. The hydroelectric station is a run-of-river type with a ground level power house, and the generating equipment has a capacity of 3 x 34,000 kW. The total penstock length is 5,316 meters, and the diameter 6 meters. The pressure regulating shaft is an overflow type with a lower chamber and is 24 meters high with an internal diameter of 12 meters.

The base on which the dam rests consists of middle and upper Cambrian dolomite and small quantities of incompetent intercalations. The rock layers dip towards the right bank and slightly downstream; the dip angle is 25-40°. There are ten faults passing through the dam, either along the river bed or intersecting it, and during construction reinforcement grouting and anchor rods were used to strengthen the dam's foundation. The tunnel is about 200-300 meters below the surface, and its line passes through strata consisting of dolomite, limestone, coaly shales and coal strata, with 22 main faults and two underground watersheds.

The tunnel was built by combined drilling and blasting and by domestically-developed full cross section cutting machinery. The linings were reinforced concrete, plain concrete, and gunite. Because of the geological complexity of the tunnel line, there is considerable subsurface water activity, and during construction there were 27 cave-ins, which were generally dealt with by using injected anchor supports, while in a few sections injected anchors and steel props were used in combination. In addition, coal beds were penetrated 11 times, with maximum gas concentrations of over 10 percent.

When making and installing the steel pipe, the overlapping seam disassembly method was used at branches having crescent-shaped strengthening ribs, making welding easier when expanding it to the original shape and making it possible to avoid extensive longitudinal welds. Work on the stage 5 power station began in 1966 and the first unit went into operation in December 1979.

Fig. 6. Honglin Hydroelectric Station

Level 6: The Hongyan Hydroelectric Station

This hydroelectric station has a double-curvature arch dam with mid-level outlets, which is 60 meters tall, 9.03 meters thick at the base and 3 meters thick at the crest; it has a reservoir capacity of 30.4 million cubic meters, and is of the daily regulation type. The power house is a run-of-river type and is built at the ground surface, with short penstocks; the installed machinery has a capacity of 2 x 15,000 kW.

In the dam area the lower-level geological structure consists of Triassic Yongningzhen micrograpular limestone of varying thickness and finely crystalline dolomite, while the upper section consists of moderately thick to thin strata of finely crystalline dolomite, marly dolomite and the like. Bedrock is exposed in the river bed, and the banks have little cover. Reverse fault No F31 is 5 to 10 meters upstream of the left arch abutment and dips upstream and slightly toward the left bank at an angle of 60-90°, with a fault displacement of 2-3 meters. The rock in the fracture zone is considerably disintegrated and consists of plastic clays and conglomerate, which has a negative effect on compression deformation at the end of the arch and on percolation.

Five mid-level openings measuring 7 x 6.4 meters are located 17 meters below the crest of the dam, each with a pit angle of 20° and with a flat gate on the downstream side. At the lower level is a 2.7 x 2.7 meter outlet. The stress on the arch dam was calculated by computer using a three-dimensional finite element procedure, and the results were close to those obtained in structural tests.

Because of the narrowness of the stream valley, during construction work the current was diverted at various times by an underwater cement coffer dam, after which the foundation rock was cleared and the dam built to the water surface level; during flood season the dam abutments and the two banks were cut, from the top down. The debris was removed by excavators and trucks, and all construction machinery and materials were hoisted down by a crane and a specially-developed hoist. Mixing towers were located on the right bank and at the power house. The concrete on the dam was laid in slabs 5 meters high and 15 meters long, with a crane used to lower the cement containers directly into the forms. The embankment at the location of the power house was cut with smooth-surface blasting, and the tailrace forms were hoisted into place and the concrete poured in situ.

The load-bearing capacity of the abutment rock was rather low, and in order to decrease the stress on the arch, the thickness of the right abutment was somewhat increased, by a maximum of 1 meter; in addition, a reinforced concrete cushion 1 to 2 meters thick was installed to increase the rigidity of the upper and lower parts of the dam and to make the stress on the ends uniform. In addition, the fracture zone of fault F31 was cleared and plugged. Using this as a foundation, curtain grouting and deep-hole reinforcement grouting were applied to the ends of the arch. Work on this station was begun in 1971 and the first unit went into operation in 1974; several years' operation indicates normal conditions.

Gezhouba Hydroelectric Project Progress

Beijing SHUILI FADIAN [WATER POWER] in Chinese No 7, 12 Jul 81 p 3

[Article: "Impoundment, Navigation Provisions and Preparation for Operation at the Gezhouba Key Hydroelectric Project"]

[Text] Since the river was successfully spanned early this year at the Gezhouba key hydroelectric project, a half-year's effort has led to successful impoundment, the beginning of navigation through locks 2 and 3 and the third channel, and the completion and installation of power station unit 1, which is currently undergoing testing and adjustment in preparation for operation.

By the first third of May 1981, the earthmoving and construction of the installations of stage 1 of the main section of the Gezhouba project were essentially complete. Several months' inspection, measurement and operation were indicated that all this work meets design requirements, and it has all received intermediate pre-impoundment acceptance by the relevant state ministerial committees and design and operating departments. This testing and acceptance has applied to the cofferdam on the main channel, the tail section of the sluicegate on channel No 2, the water retaining wall and underwater sections of the power station building, the navigation route on channel No 3, locks Nos 2 and 3, the scouring sluice on channel No 3, the earth and stone embankment on the left bank and the water-retaining section of the Huangcao embankment. Following inspection it was concluded that the works were suitable for impoundment, and with reference to the requirements for interior and exterior measurements on the various installations at different water levels during the impoundment process and to hydrographic conditions, it was decided to begin impoundment on 23 May. The initial water level during impoundment was about 48 meters, and the discharge at the Ichang station before impoundment was 15,300 m^3/sec. The impoundment was carried out in four water-depth stages, and step-by-step readings were taken on the facilities during the process. After 13 days, the current reservoir operating level of 60 m was attained. Brief information on some of the main installations and equipment is given below.

1. The transverse cofferdam upstream on the main channel: The transverse cofferdam upstream on the main channel has a sand, gravel and stone shell and an impervious concrete core wall for its vertical watertight system. The top of the cofferdam is at a height of 66 meters, and the total amount of fill work was 26.6 million cubic meters. The watertight wall is double. The first wall's watertight area is 30,000 square meters; it was compacted up to the 55-foot level, then topped with a concrete wall. The cofferdam has already reached the design height, and the first watertight wall is complete. Curtain grouting of the highly pervious foundation section from tubular passages which were purposely left in the watertight wall is proceeding. Quality problems in the construction of the wall have been dealt with. According to observations and measurements following impoundment, the increase in the water level upstream has produced no evident changes in the water level in the foundation pit in the main channel. With the exception of minor damage, the 69 strain gages, clinometers, soil pressure boxies, joint monitoring devices and zero-stress meters embedded in the first watertight wall are operating normally. It is also planned to embed pressure tubes, percolation pressure meters, clinometers, sedimentation tubes, lateral pressure detectors and seismometers in the cofferdam in order to monitor it.

2. The sluicegate on the secondary channel. This sluicegate is divided into the housing and the protective apron. The housing has a total of 27 openings arranged in two levels, each measuring 12 x 12 meters, with the upper flat and the lower arched. It is already more than half a year since the first works were placed in the stream and the flow divided. Especially following impoundment of the water, the sluicegates have been used frequently in order to keep the upstream water level relatively stable, and the arched gates and gate-lifting mechanisms have been tested singly and in groups and shown to meet design requirements, in addition to which the hydrodynamic characteristics also meet design specifications. Currently the 2 x 250 ton gating mechanisms atop the dam are undergoing load tests related to operation of the upper flat sluicegates, emergency inspection and repair, and handling flood stages. No abnormal conditions have been observed during use of the protective apron; measurements of water leakage through the troughs and channels below the apron and measurements and numerical analysis of flow through the foundation openings indicate that they are all smaller than the design values. Because of the low Fo [0154] number, energy dissipation results are rather poor, and the downstream area affected by waves is greater than predicted.

3. The power station on the secondary channel. The rockfill of the broad channel for the main machinery section of the power station meets the reservoir height requirements. The intake gate and tailrace gate or "plug" have already been used to block water flow, and the intake debris screen is in place. The installation area and the section for block No 1 have already been sealed, and preparations are made for sealing off the areas for blocks 2 through 4. The main turbine of unit 1, with a capacity of 17,000 kW, a unit weight of 4,000 tons and a rotor diameter of 16.9 meters, has already been completely installed, and installation of units 2 and 3 by the end of the year is planned. The main transformer core has already been installed and inspected. Currently, turbine unit No 1 is undergoing adjustment and testing in preparation for operation.

4. Navigation canal and locks on third channel. Dredging of the Nanjinguan navigation channel is complete, and the underwater concrete protective embankments have been completed at the upper and lower entrances. Final construction details are now being completed at the upper and lower entrances. Final construction details are now being completed. Following completion of the earth moving and of the structures, metal framing and electrical equipment installation on locks Nos 2 and 3, tests and adjustments were made in both emptied and filled condition, and test passages were made by boats. Tests and measurements indicated that the hydrodynamic characteristics of the filling and emptying facilities for the locks were excellent, the filling and emptying rate was high, and vessels were raised and lowered smoothly inside the locks. The V-shaped gates operated smoothly, their water retention capability was good, and in particular the gate of No 2 lock, 34 meters high, consisting of two sections 19.7 meters broad weighing 600 tons each, was installed with a precision meeting design requirements and gave excellent results during test operation, making it possible to resume direct passenger and freight service between Hankou and Chongqing.

5. Monitoring of the project. Because the operating conditions for the Gezhouba project are complex, and the technical specifications for the various installations are exacting, in order to assure safe operation and to carry out design and scientific research and accumulate data, large numbers of monitoring instruments have been imbedded in the works; most of them are in good operating condition. For

example, 2,058 prototype instruments have been imbedded in the main dam (including the cofferdam upstream in the main channel), and 95 percent are working properly; all have been including in systematic monitoring. Monitoring work on the Gezhouba project includes monitoring of deformation of the external part of the main dam, monitoring of the interior of the main dam, percolation pressure monitoring, hydrodynamic measurements and the like. Judging from the first stage of measurements, the operating conditions of all of the installations are excellent; no abnormal conditions have been found in internal and external monitoring.

The virtual completion of the first stage of the Gezhouba project, the beginning of its operation and realization of the first benefits of its construction are an indication of our country's further progress in the modernization of hydroelectric construction. The flood season has arrived on the Yangtze, and the various works are currently facing their first flood-season tests since they went into operation. Preparation for the second stage of the project has already begun, involving extremely arduous engineering tasks, and all of the builders have resolved to redouble their efforts, advance victoriously and build the Gezhouba dam with high speed, high quality and high standards.

Longtan Dam Selection Conference

Beijing SHUILI FADIAN [WATER POWER] in Chinese No 7, 12 Jul 81 p 51

[Article: "Dam Selection Conference For Longtan Hydroelectric Station Held in Nanning"]

[Text] The Ministry of the Power Industry and the People's Government of the Guangxi Zhuang Autonomous Region recently held a joint dam selection conference for the Longtan Power Station on the Hongshui River. The conference was attended by representatives and experts from the State Construction Committee, the Ministry of Water Conservancy, the Ministry of Communications, the Ministry of Metallurgy, the Institute of Geology, CAS, the Scientific Research Institute of Water Conservancy and Water Power, the Pearl River Committee of the Ministry of Water Conservancy, the Office of Hydrogeology of the Ministry of Geology, the Guizhou Province Construction Committee and Electrical Power Office, the Guangdong Province Earthquake Office, the Shaanxi Province Hydroelectric Power Office, Guangxi University, the Liuzhou Railway Office, relevant units of the Guangxi Zhuang Autonomous Region and some design institutes and engineering bureaus in the Ministry of Electric Power system, and unit No 00619. The conference participants heard a report by the Central South Survey and Design Institute, made an inspection of the site, conducted serious discussions, and finally reached unanimity of views on dam selection, approving the Longtan Dam proposed by the Central South Survey and Design Institute.

The Hungshui River has plentiful water power, with a usable head of 374 meters in seven stages between Longtan and Dateng Gorge; the installed capacity is 8.34 million kW, and annual power output is 42.9 billion kWh, making it a "bonanza" in our country's water power construction. Longtan is located on the upper reaches of the Hongshui river and regulates an area of 98,500 square kilometers, accounting for 75.3 percent of the Hungshui River watershed area; the multiyear average discharge is 1,590 cubic meters per second. The annual runoff is 50.2 billion cubic meters. After the Longtan Hydroelectric Station is completed, it will supply electricity for the Guangxi nonferrous metals base and Guangdong and Guangxi provinces and autonomous regions, and will make it possible to integrate south China into the unified power grid; the Longtan Hydroelectric Power Station will be able to fully play its key role in the system, functioning as the system's main load regulation station.

The Longtan station is intended primarily for generation, but will also yield the benefits of flood prevention and navigation. Currently the scale of construction has not been determined, but when the normal water storage level is 400 meters the total capacity of the reservoir will be 27.46 billion cubic meters and the effective capacity 22.34 billion cubic meters. In run-of-river operation, it will assure an output of 1.53 million kilowatts. The installed machine capacity will be 4 million kW and the annual power output will be 18 billion kWh. It is thought that when the entire cascade goes into operation, the assured output at Longtan can be as high as 1.81 million kW and the annual power output 18.6 billion kWh. Because the Longtan reservoir is large, the storage regulation effect will be considerable, guaranteeing that the total output of the six downstream stages can increase by 1.61 million kW compared with simple operation, and the annual power output can be increased by 6.1 billion kWh. Accordingly, the Longtan Hydroelectric Station's motive power prospects are excellent. As regards flood protection, because of its excellent regulating characteristics, when combined with other flood protection measures it can provide a certain flood control effect for both banks downstream and the Pearl River delta region, and can improve navigation conditions both upstream and downstream.

The scale of the Longtan Hydroelectric Station project is immense, and when the normal water storage level is 400 meters, the maximum dam height is about 200 meters. The concrete gravity dam project involves 11.83 million cubic meters of earth work, emplacement of 9.3 million cubic meters of concrete, and a total investment of 3.1 billion yuan. The rockfill dam project calls for 66 million cubic meters of earth work and 34.60 million cubic meters of rockfill, emplacement of 2.49 million cubic meters of concrete and a total investment of 3.7 billion yuan. Some 55,000 mu of agricultural land will be flooded and 64,000 persons will be displaced.

In the last 20 years, the relevant departments have drawn up many plans and made many surveys and designs for the Longtan section of the Hongshui River; the Guangxi Zhuang Autonomous Region has also published a "Report on Planning for Comprehensive Utilization of the Hongshui River." Since 1978, the South Central Survey and Design office and unit No 00619 have proceeded on the basis of the Guangxi Hydroelectric Design Institute's work and have carried out a large quantity of surveys, tests and design work. In the 13 km gorge in the Longtan section between the mouth of the Buliu River and the county seat, they made comparative studies of the mouth of the Buliu River, Longtan, Macun and Liupai. Topographic and geological conditions are rather good at Longtan, the two banks are rather high and the base for the dam is middle and lower Triassic sandstone; the rock is rather strong; the sandstone's average wet pressure resistance is over 1,400 kg/cm^2, that for the shale is 600 km/cm^2, and the deformation modulus is $E_0 = 15\text{-}20 \times 10^4$ kg/cm^2. Accordingly, although there is some slip between strata and there is a fault along the river, some slightly inclined jointing and fissuring, as well as creep of the rocks on the river bank and other geological problems, it is thought that measures can be taken to deal with them and that a high dam can be successfully built at the Longtan embankment. In the reservoir area, the main bedrock is Triassic sandstone and shale and the sealing conditions for the reservoir basin are good; although there are limestone outcrops in several locations, the likelihood of leakage is small, and a final determination remains to be made only regarding certain underground watersheds in the diversion tunnel.

The conference participants concluded that since flood levels at the Longtan site were high, the stream bed was narrow, the geological conditions rather complex, the engineering difficulty great and the technical requirements high, further survey, design and research work should be conducted regarding the geological problems mentioned above, the high water head and large flow and flood discharge, stream diversion during construction, the large underground excavation for the power house, location of the central facilities, the crushing of rock material for the proposed large rockfill dam, waterproof materials for the dam, excavation of the high banks, measures for decreasing the quantity of excavation required, debris removal and the like.

The conference participants requested that the South Central Survey and Design Institute proceed from existing work to strengthen their surveys and studies, add to their exploratory and testing work, carry out a good economic analysis and present a feasibility report on the Longtan power station as quickly as possible, and carry out research on technical problems in a systematic manner.

Datong Second Power Plant

Taiyuan SHANXI RIBAO in Chinese 20 Aug 81 p 2

[Article: "Touring the Construction Site of the Datong Second Power Plant"]

[Text] At the edge of Qilicun in the southern suburb of Datong city, a large modern power plant is under construction. A 70-story-high chimney points toward the blue sky and white clouds; a tower crane and portal hoist have assumed their planned positions around the main plant building, ready to lower the first hoist; huge concrete blocks are neatly stacked on the ground waiting for people to put them in place in the great cause of socialist construction--this was the scene that met us when we first saw the construction site of the Datong Second Power Plant.

At this bustling construction site, the people's work is tense and rhythmic. One only has to live here for a period of time to get the strong feeling that one is touching the powerful pulse of the four modernizations construction. In a little over 2 years, several thousand workers of the provincial First Electric Construction Company have painted a moving picture in this corner of the Datong basin.

The 210-meter chimney is currently the tallest structure in Datong city and is the pride of the building project. For this large chimney, 3,834 cubic meters of concrete was poured, and it was completed in only 2 and 1/2 months, 20 days ahead of schedule and saving 5.4 percent of the investment. No wonder people look at this chimney and marvel at the advanced technology, rapid construction speed, low cost and high quality. Not long ago a delegation from the Mitsubishi Company in Japan said after their visit that such high-level engineering is rare even in Japan. A Chinese-American scientist put it even more emotionally; he said: "Don't think that everything in America is great, the Chinese people can create even greater things."

Indeed, this chimney was built with the sweat and blood of the workers and manifests the great ambition of the Chinese laboring class. In May 1980, when workers of the provincial First Electric Construction Company responsible for this building project heard that six sets of Chinese-made generators would be installed in this new power plant, they were greatly excited. Datong is an open city with many travelers visiting from all over the world every year. Everyone who participated in the construction project can take pride in allowing the visitors to see the great achievement of the Chinese workers class. Therefore, it is their common wish to build an advanced power plant and give credit to Chinese-made machines.

During the busy construction time, working around the clock, the workers concentrated on their jobs. In building a chimney of such a great height, difficulties are caused by the elements of nature, such as wind, rain, thunder and lightning. These natural factors were already taken into consideration in the construction organization proposal and technical planning, and appropriate measures were taken to solve the problems.

Compared to others, steel bar workers were busiest in the construction of a chimney of such height. Once a layer of concrete was poured, they had to begin working on tying steel bars immediately. The entire chimney needed 550 tons of steel reinforcement, and each bar passed through the hands of these workers. The foreman of the steel bar workers was Shen Caikang [3088 2088 1660]. Shen is in his fifties, and in the busy days of the construction he was always around the important juncture whether it was his shift or not. When the chimney was built to a height of some 20 meters, a girth truss had to be built at the throat of the chimney with 32 steel thread screws, each 8 meters long and 36 millimeters in diameter. These steel bars come with curavature and had to be threaded through a jungle of other steel reinforcements inch by inch. This was not only time-consuming but could only be done half lying down due to the restriction of the location. It was therefore the toughest job in tying steel bars. Shen volunteered for the job and the first bar took him a solid 3 hours to thread through. By the time the truss was tied up, Shen had worked 30 hours on location. When the chimney reached 100 meters, a "bull leg" was installed every 10 meters. Whenever it was "bull leg" time, you could be sure that Shen was on the job. In his own words, "there is nothing luckier than to see a modern plant being built with one's own hands." This simple honest sentence overflows with the compassion of an old worker toward our great nation. And there are many old workers like Shen at the building site of the power plant. Like him, they are all pulling for the construction of the modern power plant. In 1980, there were 1,111 staff and workers of the company rated "progressive producers and workers" of the ward or company because of their contributions.

On the building ground, the workers view engineering quality as a gauge of prestige and everyone admires the winner of an "excellent" rating. When there is a quality problem, the workers try to solve the problem on their own initiative. There is the "three no good" rule that naturally became the binding rule: leaving a snake in the grass is no good; failure to come up with a method of correction is no good; and it is no good if someone with responsibility does not get the education. The task in the second ward is to lay steel pipes for circulating water. These pipes are rolled from 10-millimeter-thick steel plates and each section is 2.2 meters in diameter, 5 meters long and weighs 3 tons. The size of these big pipes would allow basketball giant Mu Tiezhu [4476 6993 2691] to walk through them standing up. Due to the sheer size, they cannot be guaranteed to be truly round in the forming process and it is therefore difficult to join them in the installation process. The requirement that the weld seam on the inner wall must be flat makes the welding especially difficult. In one incident, the 400-millimeter weld seam did not close and the welder added a steel bar to it. This was later discovered during self-inspection and mutual inspection of quality. Many workers regarded it as shameful and went ahead and took it apart and rewelded it. Because the workers consciously practice quality control, the acceptance rate of the 80,000 cubic meters of concrete poured by the company reached 94 percent, a record high. From January to May 1981, a total of 147 construction and installation jobs were inspected and almost 80 percent were rated good.

Engineering and technical personnel played a major role in the overall quality control. Their efforts and hard work have borne abundant fruit. In building a power plant of this magnitude, design drawings for ground construction alone numbered several tens of thousands. With that many drawings coming out of the hands of different people, various kinds of errors are unavoidable. In order to assure engineering quality, they met to go through the major engineering drawings meticulously before the construction began and discovered and corrected more than 300 problems. Meanwhile, in the technical improvement activities, engineering and technical staff and workers collaborated in achieving 93 major technical improvements and rationalizations of construction, saved 560,000 yuan, produced 52 small machines of various kinds and contributed to increasing the construction speed of the power plant. For example, in constructing the return ditch for circulating water, an integral mobile hydraulic adjustable mold was designed by the engineering technology department of the company and built by the metal structure plant. Deployment of this machine has not only increased production efficiency more than 100 percent but has also greatly reduced the amount of strenuous manual labor. According to the workers, it was a big job in the past to set, prop, dismantle and transport the mold plates. Now, by loosening a screw and turning a valve, the winch runs and automatically lifts out the mold. It is effortless and safe as well.

During the few days we were at the construction site, everyone in the company was discussing one problem: because the nation lacks financial resources, the investment allocated to the power plant this year is somewhat low (even so, the electrical system still has the highest investment among the units in Shanxi), so how can the best economic results be obtained with the small investment? Money should be spent where it counts, so where would it count most? After thinking things over, the important place is the hoisting of the plant's main building. We were told by deputy chief engineer Chen Renlong [7115 0088 7893] of the company that the emphasis of ground construction is on the No 1 and No 2 machines and the emphasis of installation is on machine No 1. This will allow the generation of electric power at an earlier date. If the hoisting of the main building could not be accomplished this year, the investments would still be spent but it would bring many problems for next year. So, after elaborate preparatory work, the hoisting of the main building began on 20 July.

The main plant building is the heart of the power plant. The heaviest of its prefabricated reinforced concrete structures weighs 116 tons, and the lighter ones weigh more than 10 tons. Just for the No 1 and No 2 machines there are about 1,000 pieces of various sizes with a total weight of 16,200 tons. On the hoisting ground, a tower hoist of 125-ton capacity and a portal hoist of 120-ton capacity are busy at work.

At dusk, high on the platform of the No 1 cooling tower, workers are still busy at their job amid the machine noise and under the flashing light. We seem to be seeing, in the near future, that strong currents are flowing through 55,000-volt superhigh voltage transmission lines heading toward the Beijing-Tianjin-Tangshan area, lighting up our great nation's capital and making it prettier than ever before.

Shandong Industry Sees Steady Growth

Jinan DAZHONG RIBAO in Chinese 29 Sep 81 p 1

[Article: "Steady Development of Shandong's Electric Power Industry in the Midst of Readjustment. 750,000 Kilowatt Expansion in Electric Power Generating Capacity in Somewhat More Than 2 Years. Entire Province Forms a Single Electrical Grid. Plays Major Role in Assuring Electricity for Use in Industrial and Agricultural Production and for the Lives of the People"]

[Text] Shandong's electric power industry has developed steadily in the midst of readjustment of the national economy.

Under the guidance of the spirit of the Third Plenary Session of the 11th Party Central Committee, staff and workers on the electric power front in Shandong Province have liberated their mentality, and have gone all out to speed the building of electric power. At the Shiliquan, Zhanhua, and Huangdao power plants, six 125,000 kilowatt generating units of rather high efficiency have been recently built and gone into production. They have a total capacity of 750,000 kilowatts, increasing the province's generating equipment capacity by 20.4 percent as compared with the end of 1978. High temperature, high voltage electric power generating unit capacity increased from 1978's 58 percent to 71 percent. In addition 3,094 kilometers of high voltage power lines carrying more than 35 kilovolts have been erected throughout the province, and a transformer capacity of 2.96 million volt-amperes has been newly added, increasing the province's high voltage lines and transformer capacity by 23 and 27 percent respectively over the end of 1978. Zaozhuang. Linyi, and Yantai prefectures have entered the provincial electric grid one by one. In December 1980, a single electric grid for the entire province consisting of 220,000 volt ultra high voltage power transmission lines and high temperature high voltage generation units as its backbone were announced as having been formed. The construction and placement in production of these generating, transmission, and power transformer facilities has played a major role in meeting the increasing needs for electricity in agricultural production and the people's lives. In 1980, use of electricity by the textile, paper making, and food industries was 32.9 percent greater than in 1978, and from January to August this year, it increased by another 11.6 percent over the same period last year. Electricity used for the livelihood of municipal governments throughout the province increased by 34.9 percent as compared with 1978, and between January and August this year, it increased by another 9.1 percent over the same period last year.

While hastening construction of electric power facilities, electric power industry units in the province have devoted themselves to launching a campaign of increased output and conservation, which has as its principal ingredients safety and quality, conservation of energy, and increasing economic effectiveness. They made conservation of energy, and increasing economic effectiveness. They made conservation of energy the principle tasks to be given attention in carrying out readjustment programs, enhanced electric grid economic management work, launched a general survey of thermal energy use, actively improved facilities, and strived to increase the energy utilization rate, thereby effecting substantial decreases year after year in fuel consumption standards. In 1979, in electric power plants of 6,000 kilowatts and above, 446 grams of coal were consumed for each kilowatt-hour of electricity provided, a drop of 12 grams over 1978. In 1980, the amount dropped to 434 grams, another decline of 12 grams over 1979. Between January and August this year, it fell again, this time to 426 grams, a 9 gram drop over the same period last year. In a period of somewhat more than 2 years, more than 480,000 tons of standard coal valued at more than 16 million yuan were saved. As a result of its outstanding achievements in the conservation of energy, the Shandong Province electric power industry was given the title last year of an advanced enterprise in the conservation of energy by the State Energy Commission, the State Planning Commission, and the State Economic Commission.

In the course of somewhat more than 2 years, Shandong Province's agricultural electrical enterprises also generated heartening changes. At the end of 1980, the province had somewhat more than 61,000 kilometers of high voltage electric power lines, a 24.8 percent increase over the end of 1978. It had 25 kilovolt and 10 kilovolt transformers with a capacity of 6.65 million volt-amperes, a 37 percent increase over the end of 1978. Production brigades served by electricity increased from 35.5 percent in 1978 to 43.1 percent. The area drained and irrigated by electric power expanded from 1978's more than 21.56 million mu to more than 23.88 million mu. In 1980, agriculture consumed 2.11 billion kilowatt-hours, a 45 percent increase over 1978. Between January and August this year, it increased again by 34.7 percent over the same period last year in vigorous support of the development of agricultural production. At the same time, quality of power supply throughout the province has improved greatly, equipment outages steadily declining.

Shanxi Power Supply Good

Taiyuan SHANXI RIBAO in Chinese 17 Sep 81 p 1

[Article by Lu Xiaoshan [4151 2556 1472]: "Situation Good for Shanxi's Power Supply"]

[Text] From late July to mid August, the Shanxi Provincial Bureau of Electrical Industry organized 32 enterprises under its jurisdiction in the professions of electric power generation, power supply, capital construction and remodeling and building and conducted a general cross check of the inter-plant labor competition in the first six months of 1981. The findings show a good situation of the electric industry system in Shanxi Province in the first half of this year. In February and June when the electric power demand is low, all the major economic and technological indicators are better than those of last year. "Double over-half" was achieved by the following units: Taiyuan Power Plant No 2, the Yongji Power Plant, the Shentou Power Plant, the Taiyuan Power Supply Bureau, Provincial Electric Construction Company No 3, the Provincial Institute of Electrical Power Design, the Provincial Electric Switch Plant, the Yangquan Power Plant, the Linfen Power Plant and the Changzhi Power Plant. Major economic and technological indicators have achieved the best level ever for this period of the year.

Various units of the Shanxi electric industry system have combined the economic responsibility system with the effort of strengthening ideological and political work and have obtained significant results. Paying special attention to the factional problems in the shop, members of the Party Branch at the jig tool shop of the Shanxi Provincial Electric Switch Plant went to the most troublesome teams and units to untie the knotty problems. They carried out in-depth ideological and political work, launched the movement of each party member making at least two intimate friends and created a refreshing new atmosphere at the teams and units. At the Shanxi Provincial Institute of Electric Power Design, there is a high concentration of intellectuals but the Institute leaders emphasize staff and worker training. They adopted a scheme that combines Institute-sponsored and office-sponsored activities and organized an electronics college, English and higher mathematics classes, junior and senior high school classes, and special topics workshops on hydrology, geology, surveying, computers, thermal control and drafting. More than half of all the staff and workers at the Institute participated in the training. Administration of the Provincial Electric Brake Equalizer Plant was concerned about the living conditions of the workers and first solved the housing problem for its staff and workers. Employees of this plant now average 5.5 square meters of living area and do not have to worry about housing. The Yangtong Power Company's Donghenan substation of the Lingqiu Electric Industry Bureau insisted on intelligent production and achieved the "four no's", that is, no weeds, no leakages, no category three equipment, and no accidents.

By looking into inter-plant competitions, some problems have been uncovered. For example, the problem of combining inter-plant competition and intra-plant competition, the problem of strengthening intelligent production and affirming safety-first, and the problem of inadequate solidarity in the leadership affecting work and production. Various regions participating in the inter-plant competition discussed these problems and the competition for the second half of 1981. All units are requested to make further efforts in putting various forms of the economic responsibility system on a solid basis and, taking this to be the main emphasis of the competition, strive to finish all the assignments and lay a good foundation for the yearend general evaluation.

Shanxi Power Grids Merged

Beijing BEIJING RIBAO in Chinese 29 Sep 81 p 1

[Article: "Merging Three Power Grids--Jing-Jin-Tang, Shi-Han and Shanxi--Not Only Solves Electricity Surplus Problem in Shanxi But Also Relieves Electricity Shortage in Beijing, Tianjin and Hebei Area"]

[Text] XINHUA, 28 September: At 7 minutes past noon today, the Jing-Jin-Tang, the Shi-Han (Shijiazhuang and Handan areas in Hebei Province) and the Shanxi power grids established linkage. The three heretofore independent power grids, including the Jing-Jin-Tang grid, the Shi-Han grid and the Shanxi grid in the Hebei area, have become a single gigantic inter-provincial and intercity power grid. As a result of this linkage, not only surplus of electricity in the Shanxi grid but also the shortage of electricity in the two cities of Beijing and Tianjin and the Hebei province can be solved simultaneously.

After merging the three power grids consisting of the Jing-Jin-Tang, the Shi-Han and the Shanxi, the new power grid became the second largest power grid in China with a total installed capacity reaching 8.82 million kW. Therefore, the areas originally served by the three power grids separately can now support one another and strengthen the capability to cope with accident, and thus improve the quality and quantity of electricity supply. It has also created favorable conditions for the Huabei Electric Industry Control Bureau to implement a highly concentrated and unified management.

Shanxi Province is China's important energy base. During the process of national economic adjustment, the Shanxi Electric Power Department, with government support, speeded up construction of large-scale mine-site power plants including Shentou, Niangziguan and Hexian on the one hand, and aggressively tackled construction of new transmission lines and transformer facilities as well as developing the potential of existing old facilities on the other, and thus created the present situation of satisfying all the electricity needs of the Shanxi Province, with something left over.

Today, the Huabei Electric Industry Management Bureau is positively making plans and creating conditions to bring about as soon as possible the merging of the Hu-Bao (Hohhot and Baotou) power grid with the three power grids consisting of the Jing-Jin-Tang, the Shi-Han and the Shanxi, in order to cover the entire Huabei area with a single gigantic power grid.

Shanxi Rural Electrification Reorganization Conference

Taiyuan SHANXI RIBAO in Chinese 9 Aug 81 p 1

[Article by Lu Hung [7627 5725] and Yang Junrui [2799 0689 3843]: "Provincial Rural Electrication Reorganization Work Conference Held in Taigu"]

[Text] Centered around "safety, conservation, raising revenue and cutting cost," the vital and urgent missions of rural electrification in Shanxi Province are the consolidation and reorganization of the rural electric network, the improvement of the economic effects, and the supply of power to the rural consumers while maintaining the quality and quantity of electricity.

Since the Third Plenum of the 11th Party Central Committee, rural electrification in Shanxi has moved along confidently, great achievements and contributions have been made and the prospects are very good. In 1980, the agricultural power consumption was 1.806 billion kilowatt-hours and the county level industrial power consumption was 1.476 billion kilowatt-hours. These two items amount to a total of 3.282 billion kilowatt-hours, which is more than one-third of the total electric power consumption of the entire province. The agricultural power consumption is equivalent to 30 times the total electric power production in Shanxi in the early days after the revolution.

The agricultural electric power in Shanxi has progressed steadily since it came into existence. Today there are a total of 61,000 kilometers of agricultural high voltage lines (10,000 volts or higher) in Shanxi, which provide electricity to 95 percent of the communes and 76 percent of the brigades and allow them to realize the wish of "having light without burning oil."

The availability of electricity at the great majority of communes and brigades has led to big changes in the production life of the peasants. Electricity has enlarged the area of irrigated land and improved the drought-resistance ability. Although this year has seen persistent drought, electricity has insured irrigation for many communes and brigades and has led to good wheat production. The saying among the people is: "Where there is electricity, there is food."

In the development of rural electricity, many good "electricity management" experiences have been acquired by various locations; however, there are still a number of problems existing in the electrification of rural areas, such as irrational layout of electrical network, serious line losses, incompatibility and irrational use of equipment, improper attitude toward customers, low technical level and insufficient number of electricians, "large horse pulling small wagon," and electric shock accidents suffered by people and animals. In 1980 the least number of electric shock incidents was registered. Fangshan County has had no accidents in 5 years, Guangling, Zhongyang and Xingxian Counties have had no accidents in 3 years, Taigu County has been accident free for 2 years, and a number of other counties have been accident free for 100 days. However, electrocution accidents still have to be eliminated. In the first 6 months of 1981, there have already been 79 deaths in the rural areas of Shanxi. It is therefore entire necessary to carry out further consolidation of leadership organization, equipment, and management system. Through reorganization, Shanxi's rural electrification could have a rational network layout, healthy equipment and management organization, complete technical codes, and a coordinated work system. A technical team of high standard should be formed to really realize a safe supply of electric power and to improve the economic effects. This is the future of the rural electrification.

For this reason, the provincial Rural Electrification Bureau recently held a rural electrification reorganization work conference in Taigu County. Through circulation of documents, exchange of experience, and discussion of missions and institution of measures, the attending comrades agreed that, under the guidance of the spirit of the Sixth Plenum of the 11th Party Central Committee, this conference would have a pivotal effect on the future work of rural electrification. After the conference, all the participants rushed back to their respective posts and joined the new battle of establishing a job responsibility system.

10,000 Small Hydro Plants in Guangdong

Guangzhou NANFANG RIBAO in Chinese 29 Sep 81 p 1

[Article by Sun Guohui [1327 0948 1920]: "More than 10,000 Small-scale Hydroelectric Power Plants Built in Guangdong"]

[Text] In the forum on small hydropower plant construction recently held jointly by the Provincial Energy Commission and the Provincial Bureau of Hydroelectric Power, data presented by administrative departments showed that there are new developments in small hydro construction in Guangdong Province.

According to statistics, 243 small hydropower stations were built in Guangdong in the first 8 months of 1981 and the installed capacity was increased by 73,000 kilowatts. To this point, the rural community of Guangdong Province is now in possession of 14,000 small hydropower stations with an installed capacity of 1.082 million kilowatts. This amounts to 15 percent of the installed capacity for all small hydropower station nationwide, and is the highest among all the provinces and autonomous regions. From January to August of this year, the total power production of small hydropower plants in Guangdong was 1.315 billion kilowatt-hours, which was 17.5 percent of the total electric power production in Guangdong and constitutes one of the important components of Guangdong's electric power industry.

Since the early 1970's, departments of the provincial government have put the construction of small hydropower plants on the agenda and actively assisted the electric power effort of the local units, communes and brigades from policy, capital, equipment and technology standpoints. Each year the State provides approximately 20 million yuan of aid to small hydropower plants and, more recently, there have also been 40 to 50 million yuan in loans available each year to promote the rapid development of small hydropower plants in Guangdong Province. Of the 108 counties and municipalities in the province, 102 have set up small hydropower stations and formed independent local power grids on a small scale. The installed capacities of county-operated small hydropower stations in Yangshan, Yangchun, Xinyi, Meixian, Guangning and Taishan counties are all greater than 20,000 kilowatts. With the extensive construction of small hydropower stations, electric power is provided to 96 percent of the communes, 80 percent of the brigades and 50 percent of the production teams in the province. Since 1970, Nanxiong county, located in the northern mountainous area of the province, has built 134 small hydropower stations, with an installed capacity of 14,300 kilowatts and an annual production of 381.4 million kilowatt-hours. They have not only met their own power needs but have also supplied 10 million kilowatt-hours of electric energy to the national power grid and increased their annual income by 60,000 yuan just from electricity alone.

The small hydropower stations located throughout the province not only provide lighting for the vast urban and rural areas, and low cost power for field irrigation, agriculture byproduct processing and industries in the brigades, communes and counties, they have also accumulated capital for the local areas. In Yangshan county 200 small hydropower stations were built in a 10 year effort. From 1975 to 1980, the utilization hours of the small hydropower installations exceeded 4,000 hours every year, which is higher than the national average. The county level and commune level power stations enjoyed an average annual profit of 1.8 million yuan.

Because the development of small hydroelectric power stations is highly significant to the livelihood of the population, it has received increasing attention from the party and various levels of the government. Departments of the provincial government have regarded small hydropower station development as the direction to take in solving the rural energy problem and an important component of agricultural modernization to be incorporated into the planning of rural development. In the meantime, small hydroelectric power companies are set up in certain regions and counties to strengthen the unified management of power production, supply and usage.

The deployment of rural water resources and the construction of small hydropower stations hold a promising future for Guangdong Province. In Guangdong there are 7.38 million kilowatts of small hydroelectric power resources that can be developed, and so far only 20 percent of this has been utilized. Therefore, some of the experts in Guangdong believe that as long as the policy of "whoever builds it, owns it; whoever manages it, benefits from it" is maintained and the State and the administration continue to lend appropriate support to the rural electricity effort, that small hydropower construction in Guangdong Province has a great future.

Xierhe Hydropower Project

Beijing SHUILI FADIAN [WATER POWER] in Chinese, No 5, 12 May 81 pp 55-57

[Article by Wang Congjin [3076 1783 6930] of the Kunming Surveying and Design Institute of the Ministry of Power Industry: "Development of the Xierhe Step Hydroelectric Power Station"]

[Text] The Xierhe Step Hydroelectric Power Station is situated on the Xier River between Changshan and Erhai near Xiaguan City in the Bai Nationality Autonomous

Prefecture in Dali, Yunnan. The power station utilizes and regulates the water of the plateau lakes -- Erhai. The natural waterfall is 610 meters divided into four steps. The method of development is by drawing water through penstocks (See Diagrams 1, 2). The total installed capacity of the power station is 255,000 kilowatts, annual generating capacity is over 1.1 billion kilowatt-hours, assured output is 110,000 kilowatts. The fourth, second and first step power stations have already been completed, the third step power station is being prepared for construction.

I. Natural Conditions

Xierhe is the sluice river of Erhai. It is 23 kilometers long and flows from the east to the west into Yangbijiang and belongs to the Lanchangjiang River System. The topography at the head and the tail end of the river (Xiaguan, Pingpo) is open and expansive, but the river mostly threads through deep mountain valleys and steep banks. The bedrock is exposed, water flow is rapid, the waterfalls are concentrated and they are the ideal site for building a hydrelectric power station.

Erhai, as a natural reservoir, is one of the three largest plateau lakes in Yunnan province. When the water level of the lake in ordinary years if 1,974 meters, the area of the lake surface is 350 square kilometers, total volume is 3 billion cubic meters, the exit (Xiaguan Daguanyi) controls an area of 2,470 square kilometers of the river valley. The average net flow over many years is 28.4 cubic meters/second, the annual amount of water is 900 million cubic meters.

Xierhe bypasses the southern tip of Dianchangshan, generally following the tectonic line in its development (the strike of the fault and the rock layer). Except the fourth step power station, the first, second and third step power stations are all situated on the right bank of the river, on one side of Dianchangshan. The "Dianchangshan metamorphic belt" is a fragmented and complexed compound anticline formed by the Changshan Group of the Pre-Devonian System and the metamorphic rocks of the Triassic System. The anticlinal axis extends from the north northwest to the northwest. The southern tip slants towards the south, the step power station is situated on the tip of the slant. The main tectonic line in the river valley is in the west by northwest direction. The first and second step power stations pass through the geostrata of mixed rock gneiss and callys (AnD^5 - AnD^7) of the Changshan Group of the Pre-Devonian System. The rock formation of the third and fourth step power stations is the callys of the upper Changshan Group (AnD^7) and the shallow metamorphic phyllite, metamorphic sandstone and vitroclastic marble of the lower Triassic (T_1). In addition, the major fault of Zhemo - Yangbi (F_{64}) is almost parallel to the conduit line of the third step power station and exerts a definite effect upon construction (See Diagram 3 and Diagram 1).

II. Design and Construction

The current four step development plan of Xierhe was basically determined in 1969. Its design and construction are described in general below:

(1) First step power station: This is the step power station in the uppermost reaches of the river. The dam (floor tunnel floodgate) is situated at Tianshengqiao on the edge of the Xiaguan Lake basin. The floodgate is 13.7 meters high. The reservoir (Erhai) has a normal water storage level of 1973.5 meters, operating depth is 4.5 meters, effective reservoir capacity is 1.08 billion cubic meters. The penstocks are distributed on the right side of the river. They are pressured tunnel conduits. The main tunnel is 8181.1 meters long, the diameter of the tunnel is 4.3 to 6.0 meters, the designed capacity of flow is 57 cubic meters/second. There is a double chamber pressure well and there are underground high pressure steel pipes, the slanted pipes have an incline of 35 degrees and are over 360 meters long. The plant is situated at Niubozi in an underground cavern (the main and auxiliary power houses have a digging span of 18 meters, a length of 56 meters and a height of 28 meters). Inside are installed three mixed flow hydraulic turobgenerators with total capacity of 3 x 35,000 kilowatts. The fall utilized by the power station is 246.5 meters. The total amount of actual excavation for

construction (not including excavation of the first section of the river channel) is about 470,000 cubic meters, total amount of concrete used was about 188,000 cubic meters.

(2) Second step power station: The dam is situated at Niubozi -- over 100 meters down stream from the tail water of the first step power station. It is a concrete gravity dam, maximum height of the dam is 37.2 meters. The normal water storage level of the reservoir is 1,730 meters, operating depth is 10 meters, effective reservoir capacity is 200,000 cubic meters. The conduit system is located on the right bank of the river, the intake point is inside the dam on the right bank as part of the water damming structure. The intake point is connected in the rear to exposed steel reinforced concrete pipes of 22 meters long which reenter the pressure tunnel 26 meters downstream. The tunnel is 2183.8 meters long with an inner diameter of 4.3 meters. The pressure well facility has been eliminated. Instead, there are 4 sets of governing systems regulating the rate of flow and pressure valves (three sets were imported from Switzerland). High pressure steel pipes are buried 30 to 50 meters underground at an incline of 36 degrees. The power house on the ground surface is on the bank of the upper reaches of the trench at its mouth at Yitoujing. The power station utilizes a fall of 121 meters. Total installed capacity is 4 x 12,500 kilowatts. The total amount of excavation for the power station was about 170,000 cubic meters, total amount of concrete used was 84,000 cubic meters.

(3) The third step power station: This utilizes the natural waterfall of over 110 meters along the section of the river from Yitoujing to Dahe River. The dam is 230 meters downstream from the exit of the tail water canal of the second step power station. Maximum dam height is 20.7 meters. The normal water storage level of the reservoir is 1,610 meters, the lowest water level is 1605.5 meters. The intake point is on the right side of the flood discharge and scouring sluice of the upper reaches of the dam site. The tunnel on the right bank draws water. The tunnel is 3,200 meters long and its diameter is 4.3 meters. It has an impedance upper chamber pressure well. The high pressure steel pipes are exposed ground surface pipes about 950 meters long. The power house on the ground surface is on the banks of the upper reaches of Dahejiang Village. According to calculations of assured regulation, in addition to the pressure well of the power station, there are also pressure valves beside the generators.

(4) Fourth step power station: This is the step at the lowermost reaches of Xierhe. It is also the step power station that was the first to be built. It began operation in 1971, but because of evaluation of the quality of high pressure steel pipes and other problems, for a long time, it was limited to operating with only 2 generators. The dam of the power station is situated near Dahejiang Village. It is a concrete gravity dam. The dammed water rises to 19 meters. The normal water storage level of the reservoir is 1,489 cubic meters. The water conduit tunnel is on the left bank of the river. The tunnel is 1,960 meters long and the diameter is 4.3 meters. The steel pipes and the power house are both on the ground surface. The power house is situated on the beach of the left bank of Yangbijiang at the lower reaches of the mouth of Xierhe. The power station utilizes a waterfall of 122.5 meters. Total installed capacity is 4 x 12,500 kilowatts.

(5) Dredging project of the first river segment of Xierhe: The river channel from the exit of Erhai to Tianshenggiao is about 4.6 kilometers long. The river flows through Xiaguan City. Because of its small specific drop, the river bed is high, and to regulate and extract water from Erhai for generation of electricity and to drain flood water to avoid flooding, the original river channel had to be deepened and restructured. The designed total amount of dredging was about 1,300,000 cubic meters. The original plan was scheduled for completion after three years. But because of the massive amount of mud and sand (30,000 cubic meters in ordinary years, and sometimes 40,000 to 50,000 cubic meters) being brought into that segment of the river each year during the flooding period, the actual amount of dredging was larger than the designed amount of dredging. After the river channel was dredged, when the water level of Erhai was at the average water level, the depth of the water was generally over 6 meters. This is beneficial to satisfying the need for operating the power plant when the water level is at the dead water level of Erhai, it reduces the coarseness of the river and drains flood water.

III. Major Engineering and Geological Problems

During the course of constructing the power stations, many and varied hydrological and engineering and geological problems were encountered. Several major problems are briefly discussed here:

(1) Landslides in tunnels, falling of the roof and sectional supports and floor props: In the 15 kilometers of tunnels of the three power stations already built (not including access tunnels for construction), the most frequently seen were roof cave-ins while landslides of the tunnel walls and contraction and deformation of the tunnel floors occurred less. For example, at the fourth step power station, because the lithological character was softer or alternately soft and hard, because of the rich amount of underground water, and with the overly long construction period, over 30 landslides occurred inside the tunnel of nearly 2 kilometers. The accumulated length of landslides constituted about one third of the length of the tunnels. At the first and second step power stations, because the rocks were hard, the landslide segment was only one tenth the length of the tunnel. But in some local sections, because of improper construction methods, or when the intersecting angle between the fault and the tunnel line was too small and when this was handled poorly and supports were not provided in time, the landslide would enlarge until the tunnel roof slid to the ground surface (Tongtian).

(2) The problem of concentrated upsurge of water inside the tunnels: During the course of digging the tunnel chamber, when boring pierced the compressive structural surface, or when encountering marble karst caverns, a sudden and violent surge of water occurred. When dredging the exploratory tunnel for the third step power station and piercing the major fault F a large gush of water surged out from the cavern and flooded the highway. Later, during tunneling for the first step power station, similar situations were also encountered.

(3) The problem of stabilizing the side slopes: The natural mountain slopes along the ground surface power house of the second step and fourth step power stations and the steel pipe channels of the fourth step station all showed problems in the stability of the nature of the rocks and the soil layers of the side slopes. During the course of construction, they were solved by engineering measures corresponding to their geological conditions.

(4) The problem of unloading crevasses on the banks: In the region from Niubozi to Yitoucun, the rock formation slants towards the outskirts of the mountain along the slope. The rivers are seriously eroded, the unloading tension crevasses on the river banks are very developed. During arched roof dredging for the underground power house of the first step power station, 5 large crevasses were discovered, the width of the gaps were 5 to 15 centimeters, the widest reached 50 centimeters. In dredging the steel pipe channels for the second step power station, a wide distribution of crevasses was also seen.

(5) The problem of the fault fragmentation zones and soft and weak bands: One of the engineering and geological problems frequently seen in the construction of hydroelectric power stations concerns the fault fragmented zone formed by tectonic activity, interstrata compression belts, belts of concentrated joints, interformational bands formed during the course of the diagenetic process of primary rock and metamorphism, interformational contact zones, concentrated soft and weak minerals belt, secondary bands filled with crevasses and their compound products in the rock of the foundation of the dam. For example, in the gneiss of the foundation of the dam of the second step power station, three strata of 1 to 3 centimeters each (the thickest was 7 centimeters) of mud bands were discovered. During construction, spatial distribution and properties of the bands were considered and various measures of digging and removal, intercepting, filling with concrete, using anchor steel reinforcements, filling and changing the structural form of the dam, improving the conditions of stress of the dam were carried out and predicted results were realized. Similar engineering treatments were carried out according to the position and the situation of the fault belt, compression belts and concentrated joints and crevasse belts encountered during basic digging for the several power stations.

(6) The problem of buried valleys, ancient river channels and deep and thick covering strata: The foundation of the dams of the third and fourth step power stations, high pressure pipes and the site of the surface power houses are all built on top of deep and thick alluvium and diluvium. There are also more buried valleys and ancient river channels in the river valleys and these have brought about a lot of trouble for basic dredging.

IV. Construction

The construction schedules of the step power stations on Xierhe were as follows. The fourth step power station began construction in 1958, construction ceased in 1961, restarted in 1966, and the power plant began operating in 1971. The second and first step power stations were completed in 1978 and 1979 respectively and have joined the network to transmit power. The third step power station is about to begin construction after a period of preparation. During the construction period of the hydroelectric power station projects, the latter period construction of the tunnels of the first step power station utilized plain surface demolition, blown anchor supports, floor arch sliding forms and mixing concrete additives and such new techniques. To accumulate data, train personnel, strengthen scientific research work, stress measurements of the rocks of the tunnels were taken, and sound waves were used to measure the relaxation zone of the wallrock and the completion coefficient, concrete was sprayed to line the tunnels, water pressure experiments were conducted, the original form of the tunnel chambers was observed. During the course of tunneling for the first step power station, research and experiment of the domestically produced SJG-53-12 model and the SJ58 model tunnelers were conducted.

The diameter of the SJ58 model tunneler is 5.8 meters, it tunneled the whole cross section and reached a highest monthly tunneling speed of 50 meters. The SJG-53-12 model tunneler tunneled a tunnel of 5.3 meters, and the highest speed per shift was 4.55 meters. The entire experiment showed that although some problems still exist in continued tunneling and cutting tools, it has provided first hand information for further improvements, popularization and application. In dredging river channels, the 90 cubic meters/hour hydraulic absorption mud pumping vessel, the 120 cubic meters/hour chained bucket type dredging vessel and the 120 cubic meters/hour chained shovel dredger were used jointly and a definite experience was gained. In addition, the second step power station "used valves in place of wells" as pressure regulators for the water drawing type hydroelectric power station and realized success. The crescent moon shaped high pressure fork tube experiment, manufacturing and installation at the first step power station have all provided new experience in the building of hydroelectricity.

At present, scientific research and experiments in construction using the "Newall system" are being grasped tightly because of the poor geological conditions of the water penstocks of the third step power station being prepared for construction. It can be foreseen that on the practical foundations of projects already built, the third step power station will surely hasten its construction and realization of the task of total development of the Xierhe step power stations is not far away.

Experts Fight Longyangxia Floods

Beijing GUANGMING RIBAO in Chinese 12 Oct 81 p 1

[Article by reporters Ma Jiqi [7456 7162 3823] and Yang Liben [2799 4539 2609]]

[Text] When an extraordinarily large flood in the upper reaches of the Huanghe in September this year, threatened people's lives and property, hydropower experts came from around the nation to Longyangxia to fight the flood and immediately engaged themselves in a tense battle. They went back and forth between the flood site and their offices, making observations and scientific calculations and analyses in turn, and thus contributed positively toward flood fighting by suggesting plans and measures.

In the afternoon of 6 September, the Ministry of Electric Power received an emergency report concerning the rapidly rising water level of the Longyangxia reservoir.

A 64-year old expert, Li Eding [2621 7725 7844], vice-chairman of the International Dam Committee and deputy director of the Chinese Society of Hydropower Engineering, arrived at Longyangxia on 8 September. He inspected the situation, braving heavy rains to analyze the meteorological and hydrological conditions and study the conditions of a temporary effluent barrier. He suggested that the surrounding earth embankment be made higher and reinforced to combat this extraordinarily large flood. At the same time, he advised the Qinhai Provincial Party Committee member to evacuate the residents in a five-county area including Guide county, situated in the vicinity downstream of the reservoir. In more than fortnight of fighting the flood, although suffering from a heart condition and diabetes, he went up and down a small path more than 300 steps long on the face of a cliff 100 meters high, inspecting the flood situation from the top of the embankment and directing the battle against the flood. One day, while standing on a suspension bridge over the valley investigating the flood's water-flow situation, he noticed a huge rock on top of the cliff above an earth embankment. He thought: if this rock were to slide down the cliff, it could destroy the flood overflow route. He immediately ordered the members of engineering bureau to remove the rock. During the most tense hours, he worked day and night without a break, analyzing the flood situation scientifically and making a series of suggestions concerning the flood fighting measures.

The military as well as the civilians residing in the Longyangxia work district praised Pan Jiazheng [3382 1367 6727], a member of Academic Committee, Chinese Academy of Sciences and the deputy chief engineer of the State Bureau of Hydropower Construction, Ministry of Electric Power, for his contribution toward fighting the flood. In July this year, this famous expert in the field of computational theory of hydraulic structures came to Longyangxia and rechecked by calculation the structural soundness of the surrounding earth embankment and the construction of emergency flood overflow route, focusing on a probable flood situation. According to his proposals based on the calculation, the Fourth Engineering Bureau of the Ministry of Electric Power reinforced and raised the height of the surrounding embankment three meters with rocks, and the slope facing the water was tightly packed with wire mesh cages and reinforced with concrete. They did a great deal of preparatory work to combat the great flood.

On 12 September, when the flood situation was very tense, Pan Jiazheng hastened to the work area again. At that time, the volume of flood water influx was more than 5,570 m^3/sec, and the water level was rising at the rate of 0.1 m/hr, applying ever greater pressure on the embankment. Everyone became very nervous. He went to the top of embankment in person to inspect the readings of more than 40 instruments buried inside the embankment. He did theoretical calculations to check the stability of the entire embankment, the stress in the central wall and the sidewall structure of the flood overflow route. According to the scientific design, he proposed plans to reinforce and increase the height of the surrounding embankment. During the course of flood fighting, the reinforcement works of a large number of structures were done entirely according to his proposals.

In the decisive battle to protect the embankment from the flood water, the experts, the military, and the civilians fought side-by-side, sweating profusely. Sixty-three-year old Yang Yang Chungui, deputy chief engineer of the State Bureau of Hydropower Construction, arrived at the site on 8 September and insisted on working on the site every day. On the 15th, a waterhead as powerful as a waterfall formed a gigantic swirl on the left side near the exit of the flood overflow route, violently cutting at the embankment wall. The rocks and huge cement blocks protecting the slope crumbled one after another, and the surrounding embankment was dangerously threatened. At 7 o'clock in the evening, Yang Chungui hastened to the site to inspect the swirl, standing on a cement block 4 meters high at the edge of the slope and risking his life, while the flood water surged violantly at his body. He suggested instantly an emergency measure that straw bags filled with concrete be pilled up at the base of the slope as a wall to break the water. He worked with the workers until 2 o'clock in the morning. On that day, he worked continuously for 14 hours and climbed the small path leading to the embankment three times.

Briefs

SHENTOU-YUCI LINE--The construction project of rebuilding the second 220 kilovolt transmission line from Shentou power plant to Yuci substation was completed on 25 July, 5 days ahead of schedule, and the test run began officially at 1:38 am on 30 September. The length of the second Shentou-Yuci transmission line is 210 kilometers and there are 625 steel towers and concrete posts along the way. This transmission line passes through some steep mountainous area. The workers endured great hardship and the quality of the installation meets the regulation standard completely. [By Sun Huiquan [1327 1979 3123] and Zhang Xuanyi [1728 1357 5030] [Text] [Taiyuan SHANXI RIBAO in Chinese 1 Oct 81 p 2] 9698

ELECTRIFIED RAILWAY LINE--Since the opening of the Shijizhuang-Yangquan electrified railway, it has been running safely and on-time and the transportation capacity has increased 300 percent. This electric powered railroad was completed in August, 1980 and since it opened for traffic, the hauling tonnage, running speed and frequency of the trains have all increased. The trains are used to be pulled by steam automotives which can only pull 800 tons with a speed of 23 kilometers per hour. Now each automotive can pull 1900 tons at a speed of 34 kilometers per hour. They have guaranteed the coal transportation for Yangquan, Pingding, Xiyang, and Yuxian. [By Han Zhongxiao [7281 1813 1321] and Xie Zhangming [6200 7022 0730]. HYDROELECTRIC POWER STATIONS--Beijing, 3 Nov (XINHUA)--China built 1,600 small hydroelectric power stations in the first nine months this year, adding to the total generating capacity by another 400,000 kilowatts, the PEOPLE'S DAILY reports today. China's rural areas now have more than 90,000 small hydroelectric power stations with an aggregate generating capacity of 7.33 million kilowatts, one-third of the country's total hydroelectric power generating capacity, the paper says. These small power stations turned out a total power output of 8,300 million kilowatt-hours during the January-September period. Now the country's 748 counties, about one-third of the total, 17,000 people's communes and nearly 100,000 production brigades depend mainly on the small local power station for electricity. CSO: 4020/33

GUANGDONG HYDROELECTRIC CONSTRUCTION FORUM--The Guangdong Provincial Energy Conservation Committee and the Provincial Hydroelectric Power Department recently held a forum on 28 September. The forum has provided evidence to prove that Guangdong Province has achieved greater development in the small hydroelectric power industry. In the first 8 months of this year, the province completed construction of 243 small hydroelectric plants, increasing the installed capacity by 73,000 kilowatts. To date, there are altogether 14,000 small hydroelectric power stations in the rural areas in Guangdong Province, and the total installed capacity amounts to 1.082 billion kilowatts which represent 15 percent of the total installed capacity of small hydroelectric power stations throughout the county. Small hydroelectric power stations have been built in 102 out of 108 counties and municipalities in the province. [Guangzhou Guangdong Provincial Service in Mandarin 2300 GMT 28 Sep 81 HK]

CSO: 4006/71

GUANGXI HYDROPOWER RESOURCES--Naning, 22 Sep (XINHUA)--The Guangxi Zhuang autonomous region in South China has an estimated potential of 17.51 million kilowatts of waterpower resources, 16.75 million kilowatts of which can be exploited, 95 percent of the total, according to surveys by the region's department of water conservancy and power industry. Guangxi's annual rainfall ranges from 1,100 to 2,800 millimeters. There are 937 rivers in the region. Ten big power stations with a total generating capacity of 12.9 million kilowatts can be built on the upper reaches of the Hongshui River, which has the region's largest waterpower resources. So far Guangxi has built hydroelectric power stations with a total generating capacity of 1.19 million kilowatts. [Text] [Beijing XINHUA in English 1241 GMT 22 Sep 81 OW]

CSO: 4020/9

HAINAN'S HYDROELECTRIC POWER STATIONS--During the 5 year period from 1976 to 1980, Hainan Island established a total of 246 medium and small hydroelectric power stations, with a total generating capacity of 102,000 kilowatts. The amount of electricity generated in 1980 reached 400 million kilowatt-hours. At present, some 3,700 kilometers of high-tension electric cables have been erected. As a result, 92 percent of the communes and 56 percent of the brigades on Hainan Island now have electric power supply. [Guangzhou Guangdong Provincial Service in Mandarin 2300 GMT 30 Aug 81 HK]

CSO: 4006/36

HEBEI RURAL ELECTRICITY SUPPLY--Electricity supply in the rural areas has been developed greatly in Hebei Province over the past few years. As of 31 August this year, electricity supply is available in all the counties in the province except Guyuan County, and in 86 percent of the communes and 91 percent of the brigades. In the first 8 months of this year, electricity consumption in the rural areas increased by over 410 million kilowatt-hours over the corresponding period last year. In the wake of the development of the national economy and improvement of the people's standard of living, there are growing demands for electricity. In light of this, the provincial electricity supply bureau has improved electric power supply in the rural areas by repairing and rectifying the electricity network in the rural areas. [Shijiazhuang Hebei Provincial Service in Mandarin 0400 GMT 28 Sep 81 HK]

CSO: 4006/71

JILIN POWER CONFERENCE--The provincial electric power work conference opened 29 October. Attending were responsible persons of the municipal, prefectural, autonomous prefectural and county economic commissions and electric power departments and bureaus and of provincial level departments concerned, as well as responsible persons from enterprises. (Li Zhenjiang), deputy governor, attended and addressed the conference. The conference disclosed that power output and supplies have been good since the beginning of 1981. During the January-September period, power output increased 13.2 percent over the corresponding 1980 period. Power supplies can satisfy the province's economic readjustment and the needs of the people in 1981. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 30 Oct 81 SK]

CSO: 4006/130

NEI MONGGOL POWER OUTPUT--Hulun Buir league's power departments had generated 125 million kWh of electricity by the end of September, an increase of 22.46 percent over the corresponding 1980 period. These power departments earned an income of 11.8 million yuan, 18 percent better than the corresponding 1980 period. [Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 30 Oct 81 SK]

CSO: 4006/130

SHANDONG POWER INDUSTRY--The power industry in Shandong Province has been successful in implementing contract and profit-sharing systems and in promoting ideological work. As a result, production has developed rapidly. The provincie's power output in the first 9 months of 1981 increased 4 percent over the corresponding 1980 period. Losses of electricity on transmission decreased by 10 million kWh. During the 9 months, the province's power industry made a profit of 288.8 million yuan. [Jinan Shandong Provincial Service in Mandarin 2300 GMT 25 Oct 81 SK]

CSO: 4006/130

ZHEJIANG PROVINCIAL POWER AMALGAMATION--Hangzhou, 13 Sep (XINHUA)--With the approval of the Ministry of Power Industry, Zhejiang's provincewide merger of power enterprises was recently achieved. First ever in such undertaking, the merger involves 14 power generation plants, 8 prefectural power bureaus and 44 county power companies of the province. The merger is under unified management and is expected to contribute to energy conservation and greater economic results. [Beijing XINHUA Domestic Service in Chinese 0018 GMT 13 Sep 81 OW]

DEVELOPMENTS, APPLICATIONS IN SOLAR ENERGY

Joint Cooperation Needed

Beijing GUANGMING RIBAO in Chinese 24 Oct 81 p 1

[Article by reporter Lu Liang [4151 5328]: "China's Solar Energy Scientific Researchers Suggest That Joint Cooperation Is Needed in Use of Solar Energy"]

[Text] More than 200 experts, professors, and technical personnel who attended an annual conference of Chinese Society for Solar Energy which was concluded recently in Hangzhou considered that the key to rapid development and utilization of solar energy consists of joint cooperation, stronger leadership, unified coordination, divided work cooperation and competition.

In recent years, there were a number of problems concerning scientific research, production, and popularization of solar energy utilization. The major one among these problems was scientific research on solar energy utilization. The technical forces were weak and scattered and the research works were uncoordinated, so that there were many duplications. This situation did not help the development of solar energy utilization. The experts who attended the conference suggested that the concerned leading department should treat solar energy utilization as one of the important projects related to China's energy resources study and strengthen leadership on this subject. At present, a unified system consisting of scientific research, popularization demonstration and production must be established first, then a special enterprise dealing with solar energy utilization may be built step-by-step. The concerned department should, taking into consideration the existing force and facilities, make an overall and unified plan and organization. It should selectively support the superior, distinguish between good and bad, and emphasize priorities and promote division of work and cooperation. The experts further suggested that we must take advantage of the outstanding individual feature of scientific research units, educational units, and production units, and make best use of them all. The scientific research units should concentrate on the utilization of solar energy, with some basic theoretical research. The educational institutions should emphasize basic theoretical research, and the production units should emphasize improvement of technology and quality and reduction of costs.

The experts proposed that we must quickly organize our forces and launch an allout assault on various problems related to scientific research, production, popularization and even technology in order to achieve breakthrough. Hot water heaters and furnaces ought to be designed jointly by the concerned units and manufactured by a few select plants according to specific standards.

Creation of Specialized Units

Beijing RENMIN RIBAO in Chinese 16 Aug 81 p 5

[Article by Beijing Municipal Solar Energy Research Institute: "Accelerating the Use of Solar Energy"]

[Text] In this letter we shall briefly discuss the utilization of solar energy and express some of our opinions.

From the long-term point of view, energy resources such as coal, oil and natural gas all have a finite reserve and will eventually run out. On the other hand, solar and nuclear energy will be the reliable energy sources for the human race.

China has an immense territory and abundant solar energy resources, two thirds of China have more than 2000 hours of sunshine per year. Way back in the 1950's China begun its research on the solar furnace, the solar hot water heater and solar cells. Today, the collecting area of solar hot water heaters in China has reached 100,000 square meters and the scope of application is gradually growing. There are about 2,000 solar furnaces in use at various places, most of them are of the parabolic focusing type. They have partially solved the serious shortage of fuel in some rural and remote areas. In addition, research and application of the passive solar house, solar drying devices and solar distillers have also made progress.

Every since silicon solar cell electrical system was successfully used in China's first satellite in 1971, the quality of solar cells has continued to improve and the cost has gradually decreased, applications of solar cell on the ground is broadening. Solar cell devices such as navigation light, railroad signal system and electric fence have played a role and the results are satisfactory.

According to statistics, 150 units and more than 1000 specialists and technicians in China are engaged in solar energy research and application. The China Solar Energy Society, established in 1979, has published popular science magazines and academic journals on solar energy. Academic exchange activities between China and foreign countries are also on the rise. Today there are two opposite views on solar energy. One view is that since the technology of solar energy application is still not mature, the economy of solar energy is poor, the energy density is low and elaborate facilities are required for its application, and the usage of solar energy is limited due to the alternations of day and night and the change of seasons, solar energy is an energy source for the future and should not be developed at the present time. The opposite view is that the sun is an immense and clean source of energy with many advantages and should be developed and used on a large scale immediately.

Both views are one-sided. If one looks at the history of energy development, it always takes a long transition period for a new energy source to replace an old one. Chinese history mentions the use of coal more than 2000 years ago, yet extensive use of coal as an energy source occurred only in the past few hundred years. It took almost half a century from the discovery of nuclear energy to its actual application and it is still not widely used today. Large-scale deployment of solar energy will also require some long and tedious work of research and development and demonstration and promotion. On the other hand, one should not wait until the regular energy sources of coal and oil are about to run out and then "start digging a well when one is beginning to feel thirsty." There will be energy shortages in China in the 1980's. With all the professions searching for substitute and supplemental energy sources, small-scale application of solar energy is imminent.

The economic and technical aspects of solar energy application are relative. Although some devices using solar energy require a large one-time investment, the traditional energy resource and manpower it saves and the reduction in environmental pollution are hard to estimate. In some remote areas, fuel is in very short supply; in order to solve people's food and drink problems, certain areas had to burn precious trees as fuel. In some places in Xinjiang, people cook once a week and eat dry cereal the rest of the time. Fuel for resident living is also very tight in Tibet and Qinghai. But these places have abundant solar energy, why not use it? Besides, the technology for solar hot water heaters and solar furnaces is well known and such devices are economically competitive and they are completely ready for wide use. As for the disadvantages of interrupted and diffused availability, they can be overcome with integrated use of multiple energy sources. For example, combined use of solar energy and methane is a good option.

Solar energy application should be supported and encouraged. Based on their own national interest, many countries in the world are giving their solar energy industry and users economic benefits. But the promotion of solar energy application in China is hindered because some of the economic policies are less than rational. For instance, if a barber shop installs a solar hot water heater, it is considered a capital item and depreciation fees are assessed even in winter when the item is not in use. This practice decreases the income of the enterprise and some units would rather let the device go unrepaired than use it. It is of course difficult for the State to provide general subsidy for solar energy but considerations should still be given to tax waiver for technologically mature solar energy products. Loan or installment for solar energy users and solar energy supplementations for areas of fuel shortage should also be considered.

Solar energy is highly interdisciplinary and involves many scientific fields and professions; therefore, there should be an overall planning to avoid blind efforts and the coordination between scientific research, production and promotion must be done well. At present, work in this area is very inadequate. For example, in the case of the fast-developing solar hot water heater, there is still no unified regulation on its material, production, quality, price, specification and application. As a result, there have been some confusion and waste and the promotion of new technology and new products is very slow. We suggest that specialized organizations, such as solar energy industrial companies, be established in areas that are in a position to do so in order to carry out unified management, set standards and codes and put them into practice.

Good Results Around Nation

Beijing GUANGMING RIBAO in Chinese 24 Oct 81 p 1

[Article: "Good Results in Use of Solar Energy Around the Nation"]

[Text] Good practical results have been achieved in many fields in relation to the utilization of solar energy around the nation.

Today, there are more than 30 factories in 15 provinces and cities in China where various types of solar energy water heaters are manufactured. The annual output is up to 50,000 square meters, and there are more than 100,000 square meters of solar energy water heaters being utilized nationwide. Each square meter can save 200-300 kg of coal a year. There are more than 5,000 square meters of solar energy water heaters used in Shanghai alone, substituting the coal-burning furnaces and supplying hot water for a number of governmental and private organizations. These solar energy water heaters can save approximately 1,500 tons of coal for the city of Shanghai this year. A solar energy hot water heater built in Daxing County in the suburbs of Beijing can supply hot bath water for 15,000 persons a day.

According to a study, there are more than 10,000 solar furnaces owned and utilized by the villages in various parts of the country, and members of communes in more than 20 provinces, cities and autonomous districts are known to be users of solar furnaces.

Good results from research on the utilization of solar energy have been achieved in various other areas also. The Shanghai Energy Resources Office and the Baoshangu Village Grain Control Office have jointly developed and constructed a solar energy collector having an area of 32 square meters and a volume of 27 cubic meters. Under normal sunlight conditions, it can dry 400 jins of noodles in only 4 hours. The Shanghai Xinhua Light Fixtures Plant has, in cooperation with concerned units, developed and manufactured 21 products of 16 different kinds including a silicon solar energy black-light lamp and a rubber tapping lamp. These products are being utilized by industry, agriculture, animal husbandry, national defense, navigation and medicine nationwide in 21 provinces, cities and autonomous districts. Shanghai No 2 Smelting Plant utilized the single crystalline silicon rejected by the plant and assembled various types of solar energy cells with power ratings as high as 5 kW. These cells are widely being utilized by the railroad system, seismic stations, weather stations, and for illumination purposes in the remote areas where no conventional energy sources are unavailable. China's largest 720 watt solar cell, which is installed at the Ketu railroad station on the Xizang Plateau, provides power for illumination and railroad communications in the remote mountainous area where no electricity is available, and thus has opened up a wide and bright prospect for the area. A solar energy vegetable green house was built at Xining, Xizang, and a way has been shown to solve the problems related to vegetable production during the winter months on the cold highland. Xizang has further manufactured many other types of products including solar energy electrified fences, solar energy illuminating lamps, solar energy portable lamps, solar energy cells for transister radios, solar energy cells for seismic stations, solar energy chargers for triple-flash cameras, solar energy cells for artillery applications, and solar energy cells for railroad signals.

Full Utilization in Yunnan

Kunming YUNNAN RIBAO in Chinese 5 Aug 81 p 3

[Article by Zhang Haiping [1728 3189 1627]: "Fully Utilize Solar Energy -- Our Province Has Unique Conditions To Utilize Solar Energy"]

[Text] Utilization of solar energy by man is not a thing of the past 10 or 20 years. It began from the time human beings came into existence. At that time, the use of solar energy by human beings was unconscious and indirect. For example, plants absorbed sunlight and grew, people ate the fruits of plants, used plant fibers to make cloth, and that was it.

Cases of conscious and direct use of solar energy by human beings occurred over 3,000 years ago during our nation's Western Zhou period when the use of sun flints to make fire was invented. The so-called sun flints were concave mirrors. The use of concave mirrors to focus sunlight to light moxa was an advance from drilling wood to make fire and the significance was profound and far reaching. As Engels said, this was "the first time that man controlled a natural force, thus finally separating man from the animal world."

Solar energy occupies an especially important position in the various energies of nature. It is clean, it is massive, and it is durable. The sun is in its "youth", it still has several billion years until its demise. Coal, petroleum and natural gas which are now used as the major energy sources also come from solar energy. Ancient biological sediments slowly form coal, petroleum and natural gas under ground, thus the energy of living beings is formed by the conversion of solar energy via photosynthesis. Therefore, coal, petroleum and natural gas can be said to be the solar energy of the past that has been stored. Although a massive amount of solar energy has been stored over a long period of time, it cannot withstand human consumption. At present, world consumption of energy increases 5 percent a year, and it is estimated that after 20 years, petroleum and natural gas will be exhausted and the shadow of an energy crisis is looming over the head of mankind.

Hydroenergy, wind energy and solar energy seem to be unrelated, but in fact, they are all variations of solar energy. This is because the sun evaporates moisture causing the water level to rise and to possess energy, and the sun heats air to create differences in atmospheric pressure which forms wind. Therefore, the utilization of hydroenergy and wind energy is the utilization of solar energy, but it is only an indirect utilization.

The massive use of coal, petroleum and natural gas has also brought about serious pollution, greatly worsening our living environment and affecting human health. Uncontrolled felling of forests for firewood has caused the loss of water and soil and destruction of the ecological balance. Solar energy does not have such shortcomings; it will not cause any pollution, it is available everywhere, and it does not need to be transported.

The sun delivers 80,000 billion kilowatts of energy to the earth each second. If all this energy is converted to electricity, it will be many ten thousand times more than the amount of electric power generated by the world. But, the amount being utilized now is very small, and most of it is wasted. The study of highly efficient direct utilization of solar energy is the goal which scientists of every nation are struggling to realize. At present, direct utilization of solar energy is realized in three ways:

Converting light energy into thermal energy. The installations utilized are mostly flat board or focusing heat collectors. The heat collector contains water. The water heated by the sun can be used for bathing. The installations that utilize parabolic mirrors to reflect sunlight and focus sunlight on one point and creating a high temperature of from 400 to 650 degrees centigrade are used for cooking. These are solar stoves. The principle of conversion is simple, it is easy to popularize, and it is the most successful method of utilization at present. The shortcoming is that the cost is high and the efficiency of energy conversion is low.

Converting light energy to electrical energy. Photoelectric cells that generate electricity have been manufactured by utilizing the phenomenon of certain materials that will produce an electric current when subjected to light (photoelectric effect). Photoelectric cells are presently widely used in artificial satellites and spacecraft, utilizaton on the ground is limited to unmanned beacons, lamps of navigation marks, high class watches, black lamps used in agriculture and such special situations. Large-scale utilization is possible only after the problem of high costs is solved.

Converting light energy into chemical energy. Photosynthesis in green plants is this type of conversion. This type of conversion is common in nature, it is the major and the most fundamental method of direct utilization of solar energy. Yet, compared to the previous two types of conversion, this type of conversion cannot be completely controlled by man. Scientists are studying in depth the mechanism of photosynthesis. As soon as it is clearly understood, man will be able to simulate photosynthesis to produce food grains and fuel. By that time, only water and carbon dioxide are sent into the "green factory" but what comes out will be rice, bread, fruits, vegetables and oxygen. Of course, this is a relatively distant thing, at present, the method being used is the utilization of solar energy to cultivate fast growing trees as fuel, massive cultivation of algae, and then let the algae ferment to obtain fuel.

Our province has unique conditions for the utilization of solar energy. One is the low latitude. Because the latitude is low, sunshine is strong. In the same area and over the same time, the intensity of sunshine at 30 degrees north latitude is 1.7 times the intensity of sunshine at 60 degrees north latitude. Kunming is at 25 degrees north latitude. The intensity of sunshine is very strong. The second is the high altitude. The higher the altitude above sea level, the stronger the sunshine. The reason is that when sunshine passes through the atmosphere, a part is absorbed, a part is scattered, so that the sunshine that shines through is weakened. The transparency of the atmosphere on the Yunnan Plateau is high, attenuation is small. The third is that there are more days of sunshine and the duration of sunshine is long. Take Kunming as an example. The annual average duration of sunshine is 2,527 hours and except for the rainy season from May to August, the remaining days are almost all sunny days. The fourth is that the annual temperature difference is small and the temperature of the environment is high. We can fully develop the rich and superior solar energy in our province to utilize solar energy in the cities and in the broad number of farm villages to heat water, for cooking, drying, distilling and all other possible uses. Kunming Railroad Bureau's Materials Plant has a heat collector with a light gathering surface of 56 square meters. On sunny days, it can serve the needs of over 100 people to take baths, conserving 30 tons of coal a year and 5,400 kilowatt-hours of electricity and 2,300 yuan in expenses. Practice proves utilizing solar energy has many benefits and it is not difficult to realize.

With the emphasis placed on it by the leadership at each level and the efforts of scientific and technical personnel, utilization of solar energy will produce results throughout our province.

Use in Shanghai

Beijing TAIYANGNENG [SOLAR ENERGY] in Chinese No 3, 1981 p24

[Article by Zhu Chengming [2612 2052 0682]: "A Brief Description of Solar Energy Use in Shanghai"]

[Text] There are already more than 300 persons in Changhai specializing in solar energy research.

The Shanghai Solar Energy Society was created in June 1980, and now has more than 200 members.

The total solar collector area for water heating in the city is more than 5,000 square meters; a large proportion of this area consists of flat-plate, flat-tube design of the Shanghai Industrial Construction Design Institute. As of November 1980, the solar water heating equipment plant in Chanbei Ward, Shanghai City, had produced 3,700 square meters of water heating solar collectors.

The PH-1 plastic-tube solar water heating collector developed by the Shanghai Municipal Inland Water Transport Office and other units has a heating efficiency of 60 to 65 percent, and is now coming into more extensive use.

The Shanghai Institute of Silicates, Chinese Academy of Sciences, together with the Shanghai Medical Glass Combine and the Shanghai No 5 Enamel Plant, is developing high, medium and low temperature evacuated glass tubes and enameled heat collectors preparatory to fixing the design and putting them into production; research is also continuing on the "two in one" solar heater which is built into the roof surface.

There are still a few corrugated and shallow-pool water heating collectors.

The focusing solar oven developed by the Shanghai No 15 radio plant, the automatic tracking high-temperature solar oven (diameter 5 m) experimentally produced by Shangfeng Middle School, Shanghai, the drying apparatus and high-temperature oven developed by the Shanghai Construction Equipment Plant, and the air heater developed by the Shanghai Steam Fittings Plant have all been submitted to the Shanghai Municipal Energy Utilization Technology Research Institute, and improvements are continuing.

The Shanghai No 1 National Cotton Plant has developed a forced-circulation air collector which is used in drying textile machine parts and can save 15,000 kilowatts of electricity a year.

The Shanghai Mechanical Engineering Society's Solar Energy Research Institute has installed a set of experimental solar generating equipment rated at 1,000 kilowatts, and has carried out research on solar water pumps, air conditioning, heating and collectors. In 1980 it began recruiting solar energy research fellows, and together with the Shanghai Municipal Solar Energy Soviety it has held short courses in "Solar Energy Conversion Engineering," and "Solar Water Heating Equipment Test Standards."

The total power of solar electric power generating equipment citywide is more than 15,000 watts. It includes the 9,300-watt Xinhua Lamp Plant installation, the country's first large-scale solar-powered lighthouse, installed by the Shanghai Navigation Beacons Plant, the large-size solar powered quartz electronic clock test-produced by the Shanghai No 4 Watch Factory, the country's first lot of solar-powered wristwatches, developed by the Shanghai Light Industry Research Institute, and the focusing-type solar cell array developed by the Shanghai Xinyu Power Supply Plant and the Shanghai Xinhua Lamp Plant. Shanghai-produced solar cells are also in extensive use with agricultural ultraviolet lights, rubber-tapping lamps, electric fences, seismograph, rain gauges, soil testing instruments, lighting, railway signal lights, color television differential rotators, walkie-talkies, calculators, lighters, surgeon's headlamps and navigation lights, among other uses.

The Shanghai Research Institute of Nonferrous Metals, the Shanghai Metallurgical Institute, Chinese Academy of Sciences, the Shanghai Research Institute of Silicates, Shanghai Communications College and Shanghai Scientific and Technical College are developing cadmium sulfide, gallium arsenide, photoelectronchemical, noncrystalline silicon, cast polycrystalline silicon and other types of solar cells.

With the joint efforts of the relevant organizations, Shanghai has also developed a rubber belt type reflecting material (polyamide with a vacuum-deposited alimunum film).

The Shanghai Institute of Silicates, CAS, is carrying out research on selective coatings, basic materials for thermoelectric conversion and other topics and has developed a portable solar absorptivity measuring device and a small, fast emissivity measuring device.

The Nanhui County Agricultural Science Research Institute is test-producing a solar seed breeding unit and has carried out experiments on the use of irradiation in seed breeding.

The Changhai Municipal Energy Utilization Technology Institute is an organization which focuses on energy conservation and solar energy; it now has more than 20 persons engaged in scientific research on the utilization of solar energy, and is currently studying such topics as solar ovens, solar water heaters, reflective materials for solar uses, and cadmium sulfide solar cells.

Solar Building in Quanji, Qinghai

Beijing TAIYANGNENG [SOLAR ENERGY] in Chinese No 3, 1981 pp 6-7

[Article by Zheng Minzhang [6776 2404 2374]: "Three Visits to the Quansi Solar Building"]

[Text] Quanji is on the northwest shore of Qinghai Lake and is the location of a commune in Gangcha County, Qinghai Province. This is an extensive, sparsely populated territory without an electrical network, and with little wood or straw. Cow manure is burned for fuel, and coal must be hauled more than 200 kilometers. However, there is an eye-opening solar house here. In the last year I have visited the Quanji solar building three times and have become inseparably tied to it. When I think of Quanji's brilliant sun, of the springlike atmosphere inside the solar building, and of the familiar faces of those who built, maintain and are testing the Quanji solar building, my mind is stirred and a thousand thoughts well up in it.

Last year, on the eve of the Spring Festival, while taking part in an evaluation conference on integrated solar-heated experimental buildings held in Xining, I had the good fortune to visit the Quanji solar building for the first time. This building is located over 200 li west of Xining at an altitude of 300 meters. Although the atmospheric pressure is low, the atmosphere's transmissivity is very high and the solar radiation is strong. Looking at the deep blue sky and the bright yellow sun, I was very excited: How plentiful the sunlight was here!

The Quanji solar building is a five-room, one-story building which houses the Quanji Post and Telecommunications Office and also serves as the residence for its employees. Although small, it is unique. Its south side is a two-layer glass wall and in addition there is a collector well 1 meter deep. This is a passively solar-heated building which combines direct use of the sunlight with heat-storing walls. When we entered the house out of the bone-chilling wind, we immediately were greeted by a flow of warm air. The mercury showed a room temperature of 10°C. Although this is not a high temperature, there is no auxiliary heat source; With the temperature below -20°C outside, it is by no means simple to obtain an inside temperature of 10°C relying on the sun alone. The comrades of the Quanji Post and Telecommunications Office said that since the solar building was completed in October 1979 they have used no combustion heating, and at dawn on the coldest mornings the room temperature still is about 2°C. In the coal-heated buildings in this area, the early morning temperature can be below freezing.

In addition to using solar energy for heating, the Quanji solar building also has a 100 watt wind-powered generator and a 20-watt photovoltaic panel in its courtyard. Because the wind blows on cloudy days here, and when there is no wind the sun shines, wind-powered electrical generation and solar electrical generation complement each other and meet the Post and Telecommunications Office's electrical power needs for the telephone switching equipment as well as the employees' low-power lighting needs in the evening. This is our country's first experiment in the comprehensive use of solar power, and it has provided this remote area on the Qinghai plateau with valuable experience in the use of solar power.

At the beginning of this year. I paid my second visit to the Quanji solar building as part of a joint test group organized by the Qinghai Province Scientific and Technical Committee for the purpose of carrying out tests of the building's thermal capabilities. Although only a year had elapsed, I was aware that many changes had taken place. The year before, the dimensions of the window frames and the glass on the south-facing collector windows had not matched, so that much of the glass was butted together, with large gaps, and there was much dust inside, which affected the transmissivity and the heat collecting characteristics. Following reconstruction, the heat collecting windows are tight, the rooms have suspended ceilings, the collector windows have heat retaining curtains, and the convection passages in the heat-collecting walls have been improved. The daily temperature measurements indicate that the heat collection efficiency is much better than the previous year. This winter they again used no auxiliary heat source, and the room temperatures were regularly over 10°C, falling to 5°C on only a few days; the collection efficiency was over 20 percent. A tambour wall filled with sawdust was used as outer insulation; its heat transfer coefficient was only about a third that of ordinary masonry half-walls (this insulating method is suitable for dry climates). The measurements also indicated that solar energy was indeed plentiful here; the total radiation incident on a vertical south-facing wall can reach more than 6,000 kcal/m^2-day, more than half again as great as in Beijing.

One month later I came to Xining again to take part in a technical evaluation of the Quanji solar building. The Qinghai Province Post and Telecommunications Scientific Research Institute, with the support of its sister organizations, had done a great deal of research in the past 2 years, and had made thorough preparations for the technical evaluation meeting. It presented a design report, a test report, a use report, a research summary and a preliminary economic evaluation on the Quanji solar building for consideration by the representatives. During the meeting I paid another visit to the building along with the other conference participants (a new 80-watt silicon solar cell array had been installed). Because considerable attention had been devoted to the economic results of the building, the comrades of the Qinghai Province Post and Telecommunications Research Institute presented an extremely convincing analysis for the representatives. They carried out a week of temperature measurements on the solar house and a nearby coal-heated bank building (the floor area of the bank was 39 square meters, slightly greater than that of the solar heated building). The measurement results indicated that the temperature levels in these two buildings were comparable, butthe room temperature in the bank building was somewhat lower in the morning. The heating season in this area is over 7 months long, and in 1 year the bank used 12 tons of coal, and the 200 kilometer hauling distance for each ton of coal cost over 80 yuan. So in a year the Quanji solar building could save about 1,000 yuan in coal expenses. The additional investment in the passive solar heating portion of the Quanji solar house was about 3,000 yuan, so that this part of the investment could be recovered in slightly over 3 years. Obviously, the economic results were good.

The technical evaluation committee, made up of 30 solar specialists from all over the country, made a conscientious evaluation of the Quanji solar house, and all of them approved the results of this test model and suggested that the experiment be expanded. Many representatives also suggested that additional experiments be included. For example, some of them suggested that water pumps be installed to supply subsurface water (the location is closed to Qinghai Lake and the water table is high), and that solar water heating equipment be installed, allowing our Tebetan brothers in the area to bathe; in addition, there is plentiful windpower here, and some of the participants suggested installing a 2 kilowatts solar generator to provide power for illumination.

The Quanji solar building shows that solar energy is already a viable energy source in the Jiquan area.

Solar Cells for Railway Signal Power

Beijing TAIYANGNENG [SOLAR ENERGY] in Chinese No 3, 1981 p 20

[Article by Wang Changgui [3769 7022 6311] and Huang Xijian [7806 6932 1017]: "Solar Cells Used for Railway Signal Lights"]

[Text] Railway signal lights are an important piece of equipment for maintaining railway safety and on-time operation. Our country's railways now have more than 5,000 stations, and of these than 1,500 have either no electrical service or no reliable electrical service. These stations' signaling equipment is either kerosene lamps or lights powered by air cell batteries or dry cells. The signal lights' technical characteristics are poor, their operation is not stable, their energy consumption is high, and they are labor-consuming. In order to improve this backward situation and provide a better power source for signal lamps, people have recently begun to use silicon solar cells as a power source.

The Gaolingzi station of the Harbin Railway Office is in a rugged mountain area on a 1.3 percent grade, with a harsh climate and extreme temperatures. On windy, snowy nights, either the kerosene lamps are blown out or the signals cannot be seen because of the limited visibility. The trains generally have no way of approaching the station, and accordingly every year trains have to be stopped outside the station an average of 3 times and guided into the station 50 times, resulting in behind-schedule operation and gravely affecting traffic safety. The station's signal lights use to consume 600 jin of kerosene and 260 jin of soybean oil a year, equivalent to about 400 yuan. After the changeover was made to silicon solar cells, this expenditure was eliminated; the saving over 10 years is approximately equivalent to the cost of the solar cells and nickel-cadmium storage batteries.

The Ket railway station, located between Xining and Ge'ermu on the Qinghai Railway formerly generated all its electricity with a diesel generator. At this high altitude, the air is thin and the efficiency of the diesel engine was decreased by more than 30 percent, so that not only was fuel consumption high, but servicing was particularly burdensome. Currently, silicon photocells are used as a power source; they are easy to operate, save diesel fuel, require almost no servicing, and are extremely economical and convenient.

A silicon solar cell railway signal light system consists of the following parts: 1. a silicon solar cell array; 2. a bank of storage batteries; 3. a power control unit; 4. signal lights; 5. power lines; 6. the tray, frame and tracking apparatus for the silicon solar cell array.

Experience using the solar cells to power railway signal light systems indicates that the voltage is stable, the light is highly reliable and continuous, and not only is extinguishing of the lights prevented, but the visibility is approximately doubled, which is extremely important in assuring safe, on-time railway traffic and modernizing railway operations.

In the future as the cost of solar cells decreases and their lifetime is extended, the use of solar cells in railway signal lights will become more extensive, producing noteworthy technical and economic results.

Silicon Photoelectric Cells

Beijing TAIYANGNENG [SOLAR ENERGY] in Chinese No 3, 1981 p 7

[Article by Gu Qizhong [7357 0796 0022]: "A Silicon Solar Photoelectric Cell"]

[Text] The basic material for the manufacture of silicon photocells is monocrystalline silicon. In order to decrease costs, the use of polycrystalline silicon, cast silicon and alloy silicon to produce them is being studied. The process of producing monocrystalline silicon photocells is shown in the figure. P-type (phosphorus-doped) monocrystalline silicon is used as the base material. The monocrystalline rod is cut into wafers, generally 0.3-0.5 mm thick, which are then polished and cleaned to obtain a flat, shiny, defect-free surface. Then the high-temperature diffusion method is used to form a p-n junction at a depth of less than 0.5 microns. The two sides of this junction have particles with different conductivities: electrons and holes (positrons); these attract each other and accumulate a large electric charge, and because there is a positive charge on one side and a negative charge on the other, a field (or potential) from the p side toward the n side is created across the junction. When this electric field exists, if the surface is illuminated the energy of the photons can excite the electrons in the p and n areas to produce electron-hole pairs which accumulate on the two sides of the p-n junction, and if a metal wire is used to connect the device to an external circuit, electric current will flow from the negatively charged area, and solar energy will be converted into electrical energy.

BIOGAS PROJECTS, USES EXPANDING

Expanded Role Foreseen

Beijing XIANDAIHUA [MODERNIZATION] Vol 3 No 9, 16 Sep 81 pp 4-5

[Article by Wei Lian [1218 1670] and Hui Zheng [1920 2973], Figures by Wang Shuzhang [3769 2885 2874]: "CH_4: The Rising Star of Energy"]

[Text] The Miraculous Ordinary Fuel

Imagine a fuel that has a greater reserve than oil, produces less pollution than coal, is safer than nuclear energy in power production and is more direct than solar energy. Sound like a miracle? Actually, millions of people have been using it. This fuel is plain old biogas, a colorless and odorless combustible gas known as methane (CH_4) in chemistry and is the simplest hydrocarbon consisting of a carbon atom surrounded by four hydrogen atoms. Nevertheless, many experts believe, methane will play an important role in alleviating the energy crisis, and satisfy people's energy needs for a sufficiently long time until immense energy sources such as nuclear fusion and solar energy can be developed and applied on a large scale.

At the mention of biogas, people often think only of the biogas produced by biochemical reaction from plants and manure in rural villages. Actually methane is ubiguitous. The main ingredient of natural gas is methane, so is the gas in coal mines. Of course, methane can also be produced artificially from coal, manure, garbage, and plants. Like oil and coal, biogas is produced by the decomposition of biological remains in an air-free environment, a microbiological process that has been occurring and will continue to take place. This process has formed underground gas reserves in every geological age. Today, millions of bacteria in the soil are continuing converting organic matters into great amount of biogas. Methane was first discovered in swamps and hence the name biogas or swamp gas. It escapes from the humus soil at the bottom of the swamp and repeatedly rises to the water surface as bubbles.

The Formation of Biogas

The common procedure of artificial fermention to produce biogas is a complicated biochemical process. It can be roughly divided into two stages: decomposition and reduction.

In the first stage, bacteria decompose complex organic matters such as hydrocarbons, cellulose, fruit acid, protein and fat into simple organic material such as ethyl acid, lactic acid, butyric acid, methanol, ethanol, and butyl alcohol and inorganic matters such as carbon dioxide, hydrogen gas and hydrogen sulfide. Bacteria for this stage include cellulose decomposition bacteria, fat decomposition bacteria, protein decomposition bacteria, and pectin decomposition bacteria, with the principal one being butyric acid fermentation of cellulose.

In the second stage, bacteria oxidize or reduce the simple organic matter produced in the first stage and carbon dioxide into methane. The bacterium responsible for this process is the methane bacterium, which causes the simple organic matters to react with water and decompose to produce methane:

$$(C_6H_{10}O_5) + nH_2O \xrightarrow{\text{methane bacteria}} 3nCH_4 + 3nCO_2 \text{ heat}$$

The methane bacteria can decompose butyric acid and ethyl acid into methane, oxidize ethanol and reduce carbon dioxide into methane and organic acid, and can cause the hydrogen gas to reduce carbon dioxide into methane. In short, the generation of biogas can be summarized as follows: complex organic compounds are first decomposed by bacteria into simple organic acids, alcohol and carbon dioxide, which in turn are oxidized or reduced by bacteria to produce methane.

Close Relation with Other Fossil Fuel

Methane is closely related to other forms of fossil fuel. The great developments of natural gas today are at regions that were originally oil field developments. Engineers are also exploring potential gas fields locked in sandstones; however, natural gas can only be separated from sandstones at great costs and there is not yet a perfected technology to do so.

Oil shale contains not only petroleum but great amounts of natural gas as well, may be as much natural gas to last half a century. The problem is that natural gas is locked in the oil shale and cannot be easily drilled and piped to the ground surface like in ordinary oil fields.

In the United States, a University of Texas team is experimenting the extraction of steam from the high temperature high pressure saline water 10,000-16,000 feet under ground and uses the steam to drive a gas turbine to generate electricity. Underground saline water is saturated with methane which rises to the surface along with steam and the pressure may be as high as 12,000 pounds per square inch. Researchers are exploring ways to separate out the natural gas before the steam is fed into the gas turbine. There are also people who believe that the priority should be the separation of natural gas and geothermal steam that accompanies the natural gas should be used as a byproduct. According to the estimate of Jones, an American Academy of Sciences Scientist, natural gas obtained in this manner may last 500 years.

Natural gas also coexists with coal, known to the miners as gas. It poses a great threat to the miners and may lead to casualties in case of explosion. Researchers are currently studying solutions to two simultaneous problems: venting the gas out of the coal mines and recovering the gas as a fuel. In a coal mine near Waynesburg, Pennsylvania in the United States, a drilling team bored into 800-1,200 feet deep coal seam with an 8-inch diameter drill bit and pumped in high pressure mixture of water and sand through a pipe in the bore hole. After the coal seam is cracked, the water is pumped out and the sand stays in place to wedge open the crack in the coal seam. A number of 200-300 feet long cracks are formed and gas is brought to the surface through these cracks and through the pipe in the drill hole, see Figure 1. This drilling team drilled a gas well that produces 60,000 cubic feet of gas per day. A nearly high performance gas well only produces 10,000 cubic feet of gas per day.

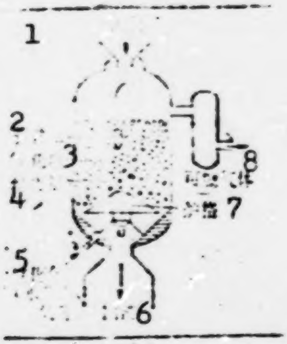
7. Water drain
8. Piston rod
9. Sleeve
10. Coal seam

Figure 1

Fabulous Skills

Methane can also be produced directly from coal by a chemical method known as coal gasification. Low heat value coal can be used as raw material in coal gasification.

Coal gasification is a thermochemical process, it uses carbon and hydrogen contained in coal as raw material, oxygen, water steam, and carbon dioxide as gasification media and, through a minimum oxidization process, carbon and hydrogen are converted into combustible gases such as carbon monoxide, hydrogen and methane. In different gasification methods and techniques, the chemical reactions are different and the methane content in the product gas is also different. Generally, if the gasification is conducted under normal pressure, carbon dioxide, carbon monoxide, hydrogen and water steam are obtained; if the gasification is carried out under pressure, methane and hydrogenated methane are obtained, see Figure 2.



Key
1. Intake
2. Preheating layer
3. Gasification layer
4. Combustion layer
5. Gasification medium (water steam, oxygen, etc.)
6. Residue outlet
7. Furnace grate
8. Combustible gas

Figure 2

Major chemical reactions leading to the production of methane are:

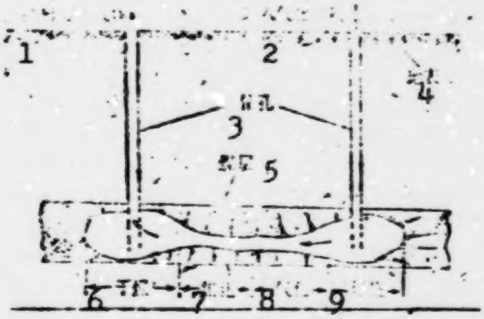
$$C + 2H_2 \rightleftharpoons CH_4 + \text{heat} ,$$

$$CO + 3H_2 \rightleftharpoons CH_4 + H_2O + \text{heat} ,$$

$$CO_2 + 4H_2 \rightleftharpoons CH_4 + 2H_2O + \text{heat},$$

$$2CO + 2H_2 \rightleftharpoons CH_4 + CO_2 .$$

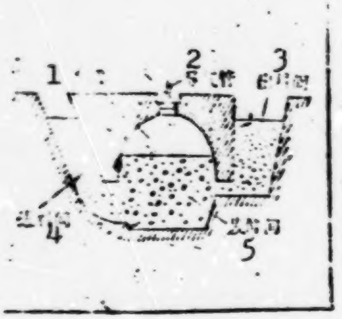
The first generation of ground surface coal gasification plants are already built. The U.S. government is also funding researchers at Lawrence Livermore Laboratory for the study of two usual gasification methods that may be more efficient. In one method, the underground unmined coal is heated and the methane gas produced is piped to the surface for further processing, see Figure 3. In the other method, solar energy is used to heat the coal directly by means of a complicated lens arrangement and causes gasification.



Key
1. Pumping out combustible gas
2. Pumping in gasification medium
3. Drill holes
4. Ground surface
5. Coal seam
6. Drying
7. Coking
8. Gasification
9. Bruning

Figure 3

Microbiological method is identical to the process in which swamp gas is formed in nature. Farms and garbage and sewer processing plants can all provide biogas. All that is required in producing biogas with naturally occurring bacteria is a constant supply of organic matters and a oxygen-free environment. Peasants load human waste, animal manure and straw of crops into a large air-tight decomposition container and maintain a certain moisture, temperature and pH value, biogas is produced after fermentation and decomposition by the bacteria. Biogas is taken out through a pipe at the top of container, as shown in Figure 4. Large biogas pools can be built in the cities to produce biogas from garbage on a large scale. It is estimated that if half the garbage is used to produce biogas, 1/5 of the natural gas demands in the United States can be satisfied.



Key
1. Gas plug
2. Gas pipe
3. Outlet chamber
4. Inlet chamber
5. Fermentation chamber

Figure 4

Branches and leaves of plants and organic waste of factories can also be used in the production of natural gas with suitable catalysts. It has also been suggested that seaweeds and water hyacinth can be converted into biogas.

Why hasn't biogas become today's major energy source? Experts believe there are technological as well as ideological reasons. In the technological aspect, great efforts are yet required in the development and exploitation of biogas as an energy resource and the costs need be greatly reduced. A more serious problem is that biogas has been neglected by people; however, as the energy crisis becomes more acute, people will undoubtedly reconsider the prospects of this form of energy resource and biogas will become one of the pillars of future energy resources.

Methane Gas Widely Used in Jiangsu

Nanjing XINHUA RIBAO in Chinese 15 Aug 81 p 1

[Article by Wang Jianguo [3769 1696 0948]: "Methane Gas Finds Wider Usages in Jiangsu Villages"]

[Text] Methane gas is finding increasingly wide use in rural villages in Jiangsu Province. Methane is not only used in cooking and lighting, it is also used to grow seedlings in greenhouses, to power grain threshers, to process food and feed and to dry tea leaves.

Today there are 700,000 rural households in Jiangsu Province using methane gas in their cooking and lighting. This has saved a great amount of energy for the country, reduced the economic burden of commune members and promoted agricultural production. More than 300 methane gas electric power stations have been built in Jiangsu which produce almost 2 million kilowatt-hours of electricity every year. In 1981 all the production brigades equipped with methane gas electric stations have generally completed their three wheat grain threshing tasks ahead of schedule because of the uninterrupted supply of electric power. In some production brigades the power generated with methane is used to operate food and feed processing plants, providing convenience to the commune members and increasing the collective income. The Qingshan tea plant in Gaochun County uses electric power generated from methane as a substitute for coal in tea production, and the tea quality has been improved. The Douzhuang middle school in Danyang County built a methane gas electric power generating station using the dejecta at the school. They have not only solved the school lighting problem but have also built a small plastics processing plant and generated 100,000 yuan of profit. The Wansui commune in Wujin County has built some 20 methane power stations; when the voltage is unstable during the peak hours at night, the commune members connect up the methane electric source and watch television programs.

The application of methane gas fertilizer is also widening. Some places use methane gas fertilizer liquid to hatch fish, grow flowers, nurture pearl clams and mix it with pesticide for use as a spray; all have worked well. The Baijiahu hatchery in Nanjing municipality uses the draff from the methane gas to raise fish; they have found that the fry grow rapidly and their disease rate is reduced. In Wujin, Wuxi and Shazhou, precipitated draff from methane gas production is used to feed mushrooms. This practice has broadened the material base for growing mushrooms and has become an important avenue for diversified business in rural villages.

Shoddy Construction Hobbles Digester Projects

Beijing RENMIN RIBAO in Chinese 16 Aug 81 p 1

[Article: "Almost 2,000 Biogas Digesters Built in Jilin"]

[Text] In the first 6 months of 1981 more than 1900 biogas digesters have been built in Jilin Province. Many of the rural areas in Jilin are short of firewood and peasants have been looking forward to using biogas at an earlier date. However, from 1975, when the pilot program began, to the end of 1981, only 1,000 biogas digesters were built in the 6-year period. In 1981, people at various places in Jilin consolidated the experience and lessons learned from the slow development of biogas and realized that the key issue is the construction quality of the biogas digesters. In many places the biogas digesters can be described as "hot for the first year, cold in the second year and fizzled out after 3 years". As a result, the enthusiasm of the public toward developing biogas was frustrated and they tend to shy away from biogas no matter how strongly it is advocated, even when they are presented with money. Therefore, efforts are made to improve the construction quality of the digesters so that every unit built is a useful one. Now that the public has benefited from biogas, they are now urging the cadres to build biogas digesters.

In less than 6 months, Yushu brigade of Dagushan commune in Yitong county built another 80 biogas digesters.

GEOTHERMAL RESOURCES SURVEYED, DEVELOPED

Xizang Autonomous Region

Beijing XINHUA in English 0713 GMT 24 Oct 81 OW

[Text] Lhasa, 24 Oct (XINHUA)--Hot springs or places with potential geothermal resources have been discovered in 66 of 74 counties in the Xizang Autonomous Region, according to the Xizang Geological Department. Thus, Xizang ranks first in China in geothermal resources. Of the 600 hot springs in Xizang, 30 are hotter than the local boiling point of 85 degrees centigrade, the department said. A recent survey of 375 springs showed that the total energy they release in a year is equivalent to the burning of 3 million tons of coal. An experimental geothermal power station was set up in 1977 in Yangbajain. Its first 1,000-kilowatt generating unit has been in operation for 26,000 hours and generated 8.9 million kilowatt-hours of electricity. Installation of a second 3,000-kilowatt generating unit will be completed soon.

Low Resistivity Layers

Beijing XINHUA in English 0710 GMT 31 Oct 81 OW

[Text] Lhasa, 31 Oct (XINHUA)--Recent surveys by Chinese and French geologists in Xizang's Yangbajain geothermal field, one of the world's largest, have revealed three low resistivity layers in the shallow strata in the earth's crust which they presumed to be the three geothermal reservoirs there. The geologists were in Xizang under the terms of a 1978 Sino-French scientific cooperation agreement. Their explorations in the 15-square-kilometer field, 90 kilometers north of Lhasa, revealed three low resistivity layers at different depths. The first is 1 to 2 kilometers below the surface, the second 5 to 6 kilometers deep and the third 14 to 18 kilometers, the team said. Since 1975, 21 exploratory boreholes and production wells have been drilled in Yangbajain. An experimental power station was built in 1977 with a generating capacity of 1,000 kilowatts. A second station with a capacity of 6,000 kilowatts is now under construction.

TIDAL ENERGY FOR POWER GENERATION BEING DEVELOPED

Beijing XINHUA in English 0725 GMT 14 Nov 81 OW

[Text] Beijing, 14 Nov (XINHUA)--China could produce 58,000 million kilowatt-hours more electricity each year by using tidal energy, announced a Shanghai science forum last week. The figure was based on surveys in the past 2 years of 156 bays and 33 river mouths from the mouth of the Yalu River that separates China from Korea to where the Beilun River empties into the Beibu Gulf in Guangxi Zhuang Autonomous Region in China's far south. Chinese scientists have also reexamined surveys, designs and other work from 1958 to 1979 for exploitation of tidal energy. China's first experimental tidal-energy electric power station went into operation in May last year in Zhejiang Province, east China.

MAKING FULL USE OF WINDPOWER RESOURCES URGED

Strengthened Leadership

Beijing GUANGMING RIBAO in Chinese 18 Sep 81 p 1

[Article by Xie Jun [6200 6511]: "Windpower Specialists Suggest That Government Should Strengthen Leadership To Make Full Use of China's Windpower Resources"]

[Text] More than 100 windpower experts of China suggested recently that the governmental department in charge should strengthen leadership to change the backward state of windpower utilization in China today, to make full use of China's windpower resources, and to let the windpower manifest its economic effect on the four modernizations construction.

This suggestion was made at the first symposium on the utilization of windpower held in China which was just concluded. The symposium considered that China is quite behind in the utilization of windpower and its research standard is low. The main problem consists of the lack of leadership and unified planning, so that everyone does his own thing without communication, resulting in scattered forces and repetition of low standard works. Therefore, the windpower experts suggested that the governmental department in charge should draft China's windpower development plan with experts from various scientific fields participating in the drafting, take measure to concentrate properly the scientific research forces with united planning of the research funding, in order to improve the overall cooperation and to raise the standard of windpower research steadily. At present, the emphasis should be placed on the development of simple, durable and cheap windmill machines in order to provide windpower machinery to those areas where regular energy sources are unavailable such as remote farming and animal husbandry districts and islands. As to those small-scale windpower machines which have already been successfully developed and authenticated, there must be a corresponding technical policy supporting their quantity production and promoting their application step-by-step. At the same time, to cultivate technological reserve, a preliminary research work on medium- and large-scale windpower machines must also be planned and carried out systematically.

NEW ENERGY CONSERVATION TECHNIQUES PROMOTED

'Energy Conservation Month'

Beijing GUANGMING RIBAO in Chinese 24 Oct 81 p 1

[Article: "More Energy from Better Management, More Energy from Better Technology; The Economic Commission, The Planning Commission and The Energy Commission Kick Off the Third "Energy Conservation Month," Emphasizing that Energy Conservation and Implementation of Economic Responsibility System Must Be Coupled With the Reform of a Phenomenon: Enterprises "Eating From a Big Pot"]

[Text] The State Economic Commission, the State Planning Commission and the State Energy Commission have decided that all departments and districts nationwide shall kick off activities related to the third "energy conservation month" in November.

China's first "energy conservation month" activities began in 1979. In the 2 years or so since, all districts and departments nationwide have combined the activities related to "energy conservation month" with the routine energy conservation work and achieved outstanding results in the field of energy conservation. Energy equivalent in amount to 23.6 million tons of standard coal was conserved nationwide in 1979; 35 million tons of standard coal in 1980; and 14.6 million tons of standard coal in the first half of 1981. It is anticipated that the task of conserving 24 million tons of standard coal this year nationwide will be overfulfilled. However, the work related to energy conservation has just begun in China with the foundation of managing energy resources still very fragile, and the phenomenon of "eating from a big pot" in matters related to the utilization of energy resources has not yet been resolved, so that great potential exists for further conservation.

In order to get activities related to the third nationwide "energy conservation month" off to a good start, the State Economic Commission and other related agencies held a special conference today in which persons in charge of various industrial and transportation agencies under the State Council participated in making preparatory arrangements for the implementation of energy conservation work.

1) Strengthen leadership, promotion and supervision of energy conservation. The leading comrades of every district, every department and every enterprise as well as the leading comrades directly in charge of production must incorporate the energy conservation work with the entire production process from beginning to end.

During the planning stage of a production process, energy saving arrangements must also be made; during the process of inspecting production, the energy saving measures must also be inspected; and when the results of production are reported, the effectiveness of energy conservation measures must also be reported. During the "energy conservation month" every district and every department must motivate the masses to review the results of energy conservation in the light of the documents concerning energy conservation handed down by the Party Central Committee and the State Council, summarizing and spreading the good experiences while criticizing and assisting the backward.

2) More energy from better management, more energy from better technology. During the "energy conservation month," every province, every city, every autonomous region and every department must conscientiously inspect its own subordinate enterprises for proper management of energy conservation work, including inspection of instruments used, the measurements, statistics, quota management, and accomplishment of energy conservation tasks. Find out and provide measures to solve the problems wherever they are so that the unit energy consumption may be brought down as soon as possible. Those enterprises which consume large quantities of energy while their products are not in great demand should take decisive action to shut them down or stop production immediately. The Ministries of Machine Building must make plans to phase out those facilities which waste too much energy.

3) Energy conservation measures should be coupled with the economic responsibility system in order to eliminate the phenomenon of enterprises "eating from a big pot" on matters related to energy conservation. In the future, production must be encouraged according to whether the production norm is advanced or backward. Fuel must be distributed according to the norm while the enterprises must adopt an energy contract system, in which the savings in energy are returned to the enterprises. During the "energy conservation month," every department must carry out investigation and study in order to establish concrete standards for various enterprises on matters related to energy conservation and to develop methods for implementing energy contract system.

4) Enterprise energy equilibrium plans must be conscientiously implemented at a faster pace. Every district and every department must, during the "energy conservation month," make special effort to implement the plan to achieve enterprise energy equilibrium, to improve the quality of its work and to give a big push to this plan by modifying the measures, if necessary.

It was also suggested during the conference that every department under the State Council should dispatch work groups to the districts during the "energy conservation month," and to work closely with the districts so that the third "energy conservation month" activities may be carried out impressively and solidly.

Reduce Oil Consumption

Beijing RENMIN RIBAO in Chinese 30 Sep 81 p 1

[Article: "State Planning Commission Calls For Further Reduction in Oil Consumption"]

[Text] The national conference on oil conservation and consumption reduction recently concluded in Beijing asked all the provinces, municipalities, autonomous regions and agencies under the State Council to overcome their indecisive wait-and-see attitude and to take effective measures in further promoting oil conservation and consumption reduction efforts and achieving greater results.

Representatives attending the conference believe that although there have been some achievements in the oil conservation drive, wastes in oil consumption are still serious and potential for further conservation is still great. For example, the thermal efficiency of some steel mill furnaces is only 8 to 10 percent, and every ton of rolled steel consumes as much as 300 kilograms of oil, which is more than 4 times the oil consumed by a regular furnace. Some glass plants use 17 kilograms of oil for each crate of glass produced whereas other glass plants working under similar conditions consume 59 kilograms of oil.

The conference called upon the provinces, municipalities, autonomous regions and agencies of the State Council to strengthen their leadership and continue to improve their oil conservation and consumption reduction with a keen sense of political responsibility and with the national economy interests in mind. All oil-burning industrial and civilian boilers and power station boilers designed to burn coal and later modified to burn oil must be converted to burn coal, and the conversion must be completed by 1985 at the latest. As for the power station boilers originally designed for oil burning, they should be modified to burn coal whenever possible, or high efficiency power generators should be built to replace them. Various types of oil-burning industrial furnaces and kilns should be systematically modified according to some schedule based on the local situation in the enterprise. Oil fields, refineries and their affiliated enterprises and business units that have been burning oil should be converted to burn coal according to schedule and by turns.

In order to further improve the effort of reducing oil consumption, it was determined in the conference, and approved by the State Council, that henceforth oil conservation projects shall be budgeted directly as national capital construction projects and equipment and materials required in the conversion will be completed and allocated as capital construction projects. Coal needed by enterprises with converted boilers and furnaces will be handled as a special project from distribution to requisition and contracts will be assigned to assure its supply.

This conference was jointly held by the State Planning Commission, the State Economic Commission, the State Energy Commission and the State Supply Bureau. Vice Premier Yu Qiuli [0151 4428 6849] attended and addressed the conference.

Zhejiang Major Conservation Measures

Beijing RENMIN RIBAO in Chinese 26 Aug 81 p 1

[Article: "Zhejiang's Effective Energy Conservation Steps Produce Results"]

[Text] Industrial departments in Zhejiang Province are treating energy conservation as a key to developing production and have achieved good results by taking effective measures. In the first 6 months of 1981, the Zhejiang industrial system has saved 200 million kilowatt-hours of electrical energy, 230,000 tons of coal and 23,000 tons of oil. Although the energy supply is 1.27 percent less than that of the same period last year, total industrial production was increased by 1.548 billion yuan over the same period of 1980.

The following are the major energy conservation measures in Zhejiang:

--By establishing a healthy economic responsibility system, energy conservation targets are put on a solid basis at every level. Establish and promulgate energy consumption quotas for unit producing major industrial products, establish a level-by-level evaluation system and make a monthly check of the energy consumption by major industries.

--A series of codes and regulations conducive to energy conservation were established based on pertinent national regulations and taking into account the actual circumstances in Zhejiang. For example, they drafted and published "Temporary Regulations of Energy Management in Zhejiang Province" and "Tentative Rules Regarding Conservation Awards for Special Fuel and Raw Materials in Industrial and Transportation Enterprises" and promoted the development of energy conservation.

--Conduct thermal energy surveys for major industries and plan and carry out heat balancing for big energy consumers to improve the utilization rate of energy resources.

--Establish conservation service companies to provide technical consultation and technical service for conservation efforts throughout the province.

--Provide technical training for boiler operators throughout the province.

--Adjust the product structure, suppress the energy intensive and unsalable heavy industrial products and develop the less energy consuming, salable consumer goods. Use our limited energy resources where they count most.

Guangdong Conserves Coal

Guangzhou NANFANG RIBAO in Chinese 13 Aug 81 p 1

[Article: "New Conservation Techniques Allow Guangdong To Conserve 100,000 Tons of Coal"]

[Text] In recent years Guangdong Province has promoted the application of new technologies, including far infrared drying, aluminum silicate fiber, and an automatic coal feeding device for boiler furnaces, and has obtained good results. According to estimates made by the provincial promotion station for industrial and communication technology, the energy saving per year is equivalent to 100,000 tons of standard coal. The manager of the station told the reporter the other day that conserving energy by scientific techniques is an important avenue to resolve the energy supply and demand conflict in Guangdong Province.

The technique of radiation heating and drying with far infrared was promoted relatively early and has now spread to almost 1,000 plants and enterprises, wherever electric heating and drying are required in the province, and has achieved 20 to 40 percent energy saving. Just from this one item Guangdong Province saved 70 million kilowatt-hours of electrical energy a year, equivalent to 30,000 tons of standard coal. Recently in some plants aluminum silicate fiber insulation has been used together with far infrared heating, and the effects have been even better. For example, the Hongxing pharmaceutical plant in Chaozhou municipality achieved a 50-percent saving of electricity by using far infrared in its vibrators and another 21.5 percent by using aluminum silicate fibers as thermal insulation; its actual electric consumption is only one-third that before the improvement.

Aluminum silicate fiber is a new thermal insulation material that is even more heat-resistant than asbestos or glass wool. Like far infrared radiation, the fiber also possesses the following advantages: low investment, quick result, mature technology, not difficult to adapt and adequate supply of material and equipment. Hence, it has quickly received wide application and has been used by more than 300 plants in many counties and cities in professions such as plastics, rubber, leather, ceramics, glass, food, medicine and electronics. Sometimes the fibers are used as an inner insulation sheath in tubes, and in other cases they are used to fill and seal jackets of furnaces and kilns or used as external insulation. Generally they can provide a 20 to 40 percent energy saving and they are an emphasized promotion item in Guangdong Province in 1981.

Guangdong has a lot of low grade coal, and many enterprises use boiler furnaces that burn low grade coal to meet this situation. But coal is fed into the boiler furnace simply on the basis of workers watching the condition of the flame. The furnace temperature is hard to control, scarring and die-out are likely, and more coal is used than necessary. To overcome this technical bottleneck, chemical meter plant No 2 of Jiangmen municipality developed an automatic coal feeding device based on a technical innovation at Kaiping nitrogen fertilizer plant. The new device automatically regulates the rate of coal feeding to insure the normal operation of the furnace. It not only assures product quality but also conserves energy. Two tons of coal can be saved in a 10-ton furnace, and the cost of installing this device can be recovered in 3 months. According to incomplete statistics, more than

100 boiler furnaces in the chemical, paper and print and dye industries in Guangdong Province have employed this device, saving 700,000 to 800,000 tons of coal a year.

In the past few months, experience exchange meetings have been held in Guangzhou municipality and in the Shantou, Zhanjiang and Foshan areas to further promote the application of new energy conservation techniques. In addition to those described above, items for promotion also include noiseless operation of AC contacts, automatic compensation of power factor, silicon-controlled speed regulation and bottomless valve water pump.

Nanjing Refinery Conservation Efforts

Nanjing XINHUA RIBAO in Chinese 27 Jul 81 p 1

[Article by Xie Zhiliang [6200 2784 2733] and Zhou Zhengrong [0719 2973 2837]: "Nanjing Refinery Obtains New Results in Conserving Energy"]

[Text] After shooting flames day and night for over 10 years, the "sky light" of Nanjing refinery was turned off in April 1980. In the 15 months since this energy conservation measure was taken, 100,000 yuan of fuel gas has been saved.

Nanjing refinery takes energy conservation seriously. Since 1979, its energy saving has been equivalent to 80,000 tons of fuel oil and it has been evaluated "energy conservation progressive unit" by Jiangsu Province, Nanjing municipality and the Ministry of Petroleum.

Turning off the "sky light" is another important energy-saving achievement of Nanjing refinery. In the petroleum refinery process a combustible gas is released into the atmosphere; since this gas pollutes the air, it must be burned. This is how the "sky light" is produced and it is a form of wasted energy. For many years people believed it was "very difficult" to put out the "sky light". Last year the plant cadres and technical staff were determined to solve this problem. They studied and took a few measurements and extinguished the "sky light" at an expense of only 2,000 yuan. Today they are continuing their efforts to recover other combustible gases released into the atmosphere.

In the past 2 years Nanjing refinery has continued to achieve energy conservation results. One important reason is that it assigns energy conservation measures and targets in the same way it assigns production projects, and energy conservation achievements are evaluated the same way production results are evaluated. In 1980, the refinery made 35 energy conservation assignments and took 100 specific measures, all of which were accomplished by the end of the year. Another 93 energy-saving projects have been assigned this year and they are being carried out according to plan.

In its conservation efforts, the Nanjing refinery pays attention to the little as well as the large. Because the budget for energy-saving technical measures is limited, the plant weighed its priorities and went for high points on major energy conservation projects; in the meantime, it carried out a variety of small improvements and modifications according to the specific condition and situation. In 1980, while major energy-saving modifications of the second set of constant pressure drop distillation devices were being worked on, a series of simultaneous small improvements were made using new types of burners and adjustment of the pump load. Without spending 1 cent of the technical operation fund, the device energy consumption was reduced by 5.3 percent, saving the equivalent of 5,200 tons of fuel oil in a year.

The refinery has also implemented energy conservation awards. The method is to assign energy conservation targets to the shop and put them solidly on a shift and individual basis. Evaluations are made and money is awarded based on the scores given to accomplished results. Very good results have been obtained.

Briefs

SHANGHAI ENERGY CONSERVATION--During the period from January to September this year, Shanghai's industrial enterprises lowered their energy consumption per 1 yuan of industrial output value by 2.1 percent compared with the same period last year. The total energy conserved during this period was equivalent to 300,000 dun of standard coal. However, waste of energy is very common. The Shanghai municipal energy conservation group and the Shanghai municipal economic committee have issued a circular calling on all industrial enterprises to make greater efforts to conserve energy during the third energy conservation month, a nationwide campaign in November. NATIONAL POLICY AND ISSUES

NEWS AGENCY LOOKS AT TWO KINDS OF READJUSTMENT

HK140303 Beijing ZHONGGUO XINWEN SHE in Chinese 0739 GMT 12 Dec 81

[Review: "Comparing Two Kinds of Readjustment"]

[Text] Deputies attending the fourth session of the Fifth NPC and members attending the fourth session of the Fifth CPPCC have been holding serious and warm discussions on Premier Zhao Ziyang's government work report in recent days. They have unanimously held China's national economic readjustment has gained notable achievements and the entire national economy has started to embark on the track of steady development. In his report, Premier Zhao scientifically summed up the experiences and lessons in China's economic construction and put forward 10 major construction principles. These are of great significance for the country's economic development.

China's economic readjustment has evoked strong international response, and even today some people are still dubious about it. One of the important reasons for this is that they mention China's economic readjustment in the same breath with economic readjustment in the West and regard the two as the same thing. In fact, these are two different kinds of economic readjustment, carried out under two different social systems, so their results are bound to be completely different.

China is a socialist country, and the major characteristics of its economic structure are that public ownership predominates and a planned economy is practiced, with economic regulation by market mechanism as a supplementary factor. China is carrying out economic readjustment in order to solve the serious defects of grave economic imbalance and irrational internal structure caused by a long period of guidance by leftist ideology, and thus guide the national economy onto the track of healthy development. This type of readjustment is therefore being carried out in a conscious and orderly way; it is a readjustment that can reach its predicted aims. This is precisely an expression of the superiority of China's socialist system. Premier Zhao's report forcefully proved this point.

The countries of the West are also carrying out economic readjustment. Both the Thatcher government in Britain and the Reagan administration in the United States have discarded the classic Keynesian economic theory of the demand side and replaced it with the economic theories of the monetarists and the supply side. They have attempted to treat the economic theories of the so-called "new development school" as a cure-all to help find a way out of the impasse. But what are the results? Let us just contrast the two different kinds of readjustment in the following four aspects:

Economic growth--China has carried out major readjustment this year and has also suffered severe natural disasters. Total value of industrial and agricultural output has risen by about 3 percent over 1980, and the entire economic situation is much better than expected. U.S. production fell by 3.5 percent last year, while Britain's fell by 6.8 percent. In the fourth quarter this year, the U.S. economic situation has deteriorated still more and production has shown a big decline. October auto sales showed a steep fall of 24 percent, while the number of business bankruptcies in that month rose by 42 percent compared with October 1980.

Finances--China has basically balanced its budget, and the deficit is estimated to fall to 2.7 billion yuan this year from 17 billion yuan in 1979 and 12.7 billion in 1980. The U.S. financial deficit is huge, and is expected to approach $100 billion in the fiscal year ending 30 September 1982.

Prices--While achieving a balanced budget, China has maintained basically stable market prices. Prices of certain commodities have indeed soared, but the government is now taking effective steps to solve these problems. U.S. prices rose by 12.6 percent in 1980, and are expected to show an annual increase of 14.4 percent this year.

Employment--China found urban jobs for 20 million in the previous 3 years, and expects to provide a further 8 million this year. U.S. unemployment was 7.5 percent in September and rose to 8 percent in October. The number of unemployed has reached 8.52 million.

Facts are the best teachers. Do not these simple contrasts clearly reveal the essence of the problem? CPPCC member and well-known economist Guan Mengjue put it well: Due to the ever-growing contradictions between the production socialization and private ownership forms in the West, the conflict between surplus production and shrinking markets is bound to become more and more sharp, and there is no way of solving this chronic malady, no matter what economic theories are applied or who comes to power. In a word, this is something determined by the West's social system, and cannot be changed by people's will.

According to Premier Zhao's report, China's economic readjustment will require another 5 years or maybe a bit longer. After the readjustment, China's national economy will lay a firm foundation for further development, and a period of economic boom will follow. The Chinese people have full confidence in this.

'ZHONGGUO XINWEN SHE' INTERVIEWS NPC VICE CHAIRMAN

HK150549 Beijing ZHONGGUO XINWEN SHE in Chinese 0930 GMT 13 Dec 81

[Feature by correspondent Huang Minxuan [7806 3046 8830]: "An Interview With Zhu Xuefan"]

[Text] Beijing, 13 Dec (ZHONGGUO XINWEN SHE)--At the fourth session of the Fifth NPC, Mr Zhu Xuefan was elected vice chairman of the Standing Committee of the NPC in a by-election. I expressed my congratulations to him.

He said: "Do not congratulate me because I personally am insignificant. You should congratulate our government and people. In a year of great disaster we have succeeded in gaining the second highest yields since liberation and striking a near balance of financial revenue and expenditure and of credit, and the people's livelihood has improved markedly. As the saying goes, people can move Mount Tai so long as they have unity of mind. This is the outcome of the government and the people in their common fight with one heart and one mind."

Zhu Xuefan said to me with deep feeling that what he longed for day and night was to see in his lifetime the compatriots on both sides of the Taiwan Strait shake hands and make it up. He said: "I sincerely propose that, before the official restoration of postal communications, colleagues of the postal services on both sides of the Taiwan Strait might as well ask for the approval from the postal service authorities of each side to mutually send 'relatives' post pags' once a week first. A transfer station can be set up in Hong Kong. The exchange post offices can temporarily be fixed in Beijing for the mainland and in Taibei for Taiwan. I hope our colleagues on both sides of the Taiwan Strait will study and consider the feasibility of this method."

People who are familiar with Mr Zhu Xuefan consider him a very energetic old man. He was the first minister of posts and telecommunications after the founding of the PRC. Although he no longer works in the Ministry of Posts and Telecommunications, he still likes to stroll in the streets and lanes and enters a telephone booth to make a call by the neighborhood telephone service to see how long it takes to get through, or goes to a post office in the downtown area to see what difficulties a sender encounters when sending a letter or a parcel. Since he often goes there, some old staff members and workers recognize him and called him "old minister" in an affectionate manner and say in a low voice: "Our old minister has come again to inspect work." Zhu Xuefan always smiles and talks with them about their professional work.

Born in Songjiang County's Fenjing Town, Jiangsu Province, Zhu Xuefan was admitted to Shanghai Post Office at the age of 19 and worked as a clerk there. In 1929, an incident happened which infuriated the residents of Shanghai: a richshaw driver was beaten to death by a foreign soldier. At that time, the workers and students in Shanghai set up a backup association and Zhu Xuefan was one of the representatives of the Postal Workers' Trade Union. He showed his organizational ability in the negotiations and was later elected a member of the Trade Union. From then on, he assiduously studied the profession of postal services while engaging in the worker's movement. He also served as chairman of the Shanghai Federation of Trade Unions.

In 1935, together with Tao Baichuan and Lu Jingshi, Zhu Xuefan organized the "China Association of Labor" in Shanghai. During the war of resistance against Japan, the "Labor Association" moved from Shanghai to Wuhan and then to Chongqing and Zhu Xuefan was the director general of the association. On many occasions he attended international labor conferences on behalf of the Chinese workers and visited many countries in Europe. To date our revered Mr Zhu can still speak a little English.

While engaging in the worker's movement before liberation, Zhu Xuefan did not cherish any political prejudices. He took advantage of the public and lawful position of the "Labor Association" to take possible measures jointly with the trade unions in the liberated areas and strive for the unity and unification of the worker's movement of the whole country. This was a great contribution in upholding the war of resistance against Japan. However, his enlightened attitude toward the worker's movement also brought about continuously escalating pressure from the Kuomintang authorities and on 15 November 1946 he was forced to flee from Shanghai to Hong Kong.

On the 10th day after his arrival in Hong Kong, Zhu Xuefan was injured in an assassination attempt. He went out by richshaw that day, and when he was passing near the Royal Navy Club at Johnston Road, a car suddenly knocked him down from behind with a powerful force. He fell to the ground in a swoon and was seriously injured. When his condition was a little better after being cured at Hong Kong's Queen Mary Hospital for a time, he went to the United States to meet General Feng Yuxiang. After his return to Hong Kong, he deliberated on the establishment of the Revolutionary Committee of the Chinese Kuomintang together with Li Jishen, He Xiangning and others. He was one of the founders of the Revolutionary Committee of the Chinese Kuomintang and is now a vice chairman of its Central Committee.

It was in January 1948 that Zhu Xuefan attended the Executive Committee meeting of the World Federation of Labor for the last time. When he arrived in London, he issued the wellknown "statement on the current political situation." Dissatisfied with the civil war "between brothers," he expressed his strong desire that China must be independent, democratic and in peace. After the meeting, which was at the end of February of the same year, he arrived from abroad at Harbin in the northeast liberated area and was warmly welcomed by CCP leaders Mao Zedong and Zhou Enlai.

After liberation, he served as vice chairman of the All-China Federation of Trade Unions.

He is concerned about the postal communications between the mainland and Taiwan and on many occasions has appealed to the Taiwan authorities: Let the family members on both sides of the Taiwan Strait communicate with one another.

Mr Zhu Xuefan has four sons and a daughter. A son and a daughter who engage in social science and natural science are now living with him and he has a group of grandchildren. Once, when someone wanted to take a photo of Uncle Zhu's "whole family," Mr Zhu laughingly said: "Do not bother. If you take a photo of my grandchildren as well, I am sure I can form a squad;" our reverend Mr Zhu is indeed a man of great humor.

His interests in life are collecting calligraphy and paintings, but they are not from well-known persons; he likes growing flowers, but they are the precious ones. He also often practices calligraphy after a model. He said: "Practicing calligraphy is the best rest for my brain."

NPC DEPUTY ON PEOPLE'S RISING PURCHASING POWER

OW100426 Beijing XINHUA in English 0310 GMT 10 Dec 81

[Text] Beijing, 10 Dec (XINHUA)--As people have more money in their pockets, they are now buying better food and a greater variety of consumer goods, said Zhang Binggui, a shop assistant and deputy to the National People's Congress.

National model worker Zhang Binggui, who works at Beijing's biggest department store, said that customers, both young and middle aged, men and women, were choosing more stylish clothing nowadays.

Young women now buy more colorful costumes, better face creams and hair oils, Zhang Binggui said. A new kind of face cream containing pearl powder that soothes the skin well is a best seller although it costs about one yuan more per bottle than the common types.

"The policy of giving priority to light industry mentioned by Premier Zhao Ziyang in his report to the N.P.C. session," he said, "is a policy for the people. It has put a rich supply of consumer goods on the market."

People are no longer content with traditional patterns, he said. They want new designs of textiles, clothing, bed blankets, furniture, thermos bottles, vases and ornamental artificial flowers.

TV sets, woolen and silk textiles and tape recorders, only within the reach of people with higher pay before, are now quite popular items, the model worker said.

Zhang Binggui, now 62 but in good health, has been a shop assistant for 45 years and is now working in the candy selling section. Customers take more time to select candies, he said. Their favorite choices include famous Beijing crisp candy, walnut and coffee candies, and sweets containing calcium specially made for children. There is also a kind of candy suitable for people suffering from diabetes.

He said that his department store sold both luxuries and cheap things that cost no more than one cent, such as a piece of candy or a button, for the convenience of the people.

Zhang Binggui said that his department store at the downtown area of Wangfujing sells 28,000 varieties of goods ordered from all parts of the country. Its business transactions have grown in the past few years and amount to 220 million yuan this year.

Zhang Binggui still stands behind the counter about 2 hours a day. He always surprises the customers by his speed in taking, weighing and packaging candies and calculating the prices. "I do this to save time for the customers," he said.

His daily work also includes training young shop assistants and devising ways for improving management, Zhang Binggui said.

CPPCC ENDORSES REPORT ON STANDING COMMITTEE WORK

OW150441 Beijing XINHUA Domestic Service in Chinese 1158 GMT 14 Dec 81

[Resolution of the fourth session of the Fifth CPPCC National Committee on the report concerning the work of the Standing Committee--adopted by the fourth session of the Fifth CPPCC National Committee on 14 December 1981]

[Text] Beijing, 14 Dec (XINHUA)--The fourth session of the Fifth CPPCC National Committee unanimously endorses the report by Vice Chairman Xu Deheng on the work of the Standing Committee.

Our country's political and economic situation has been good and the patriotic united front has been further consolidated and developed since the third session of the Fifth CPPCC National Committee, held in September 1980, and under the leadership of the CCP. The Standing Committee has done a great deal of work, in compliance with its decisions and in keeping with the new situation, by relying on all CPPCC members. The session is satisfied with the achievements made.

The work principles and tasks for the CPPCC that are put forth by Vice Chairman Xu Deheng in his report are adequate. The session calls on the Standing Committee and other work departments to pay attention to the criticism and suggestions put forth by the plenary meeting, to adopt positive measures for strengthening the ties between the members and local CPPCC organizations, to conduct thorough investigation and study, to pay attention to summing up experience, to improve work and raise efficiency, to vigorously implement the principles and tasks put forward in the work report and the political resolution approved by this plenary meeting and to make new contributions toward accomplishing the socialist modernization, safeguarding world peace and fulfilling the great cause of reunifying the motherland.

NATIONAL POLICY AND ISSUES

BEIJING NPC DEPUTIES BRIEFED ON FINANCE MATTERS

OW131249 Beijing XINHUA Domestic Service in Chinese 1455 GMT 12 Dec 81

[Report by XINHUA correspondents Chen Naijin and Zhu Jigong]

[Excerpts] Beijing, 12 Dec (XINHUA)--NPC deputies think: Although the country still faces many difficulties, the party and government have made very great efforts to improve the livelihood of the people in urban and rural areas. This is by no means easy, and it demonstrates the superiority of socialism.

At their panel meetings to examine Premier Zhao Ziyang's report on the work of the government, the Beijing delegation attending the fourth session of the Fifth NPC asked a staff member of the Ministry of Finance present at the panel discussion to brief them on relevant financial conditions of the country. The comrade from the Ministry of Finance gave two accounts at the panel meeting:

First, in the 3 years from 1979 through 1981, increased purchase prices for agricultural and sideline products and reduced taxes in rural areas have reduced state revenue by a total of more than 52 billion yuan, of which more than 44 billion yuan was used for increasing purchase prices for agricultural and sideline products. The masses of peasants have increased their incomes as a result.

Second, in the 3 years from 1979 through 1981, more than 20 million people in cities and towns have been provided jobs. In addition, wages for workers and staff members have been increased, and a reward system has been implemented. This has resulted in increased expenditures and reduced revenue by a total of 40.5 billion yuan. Of that amount, 10.4 billion yuan has been spent for expanding employment in these 3 years. As more people are employed, the number of people supported by each worker or staff member in cities become fewer, and the livelihood of workers and staff members improves accordingly.

According to information provided by the Ministry of Finance, in order to stabilize market prices since purchase prices for agricultural and sideline products were raised, the state has taken measures to subsidize the prices of 28 basic necessities required by the people and products serving the needs of agriculture. In 1978 the state spent 7.8 billion yuan for price subsidies. This was increased to 14.6 billion yuan in 1979 and 20.8 billion yuan in 1980, and it is estimated that it will be more than 32 billion yuan this year. Of this year's price subsidies, subsidies for grain, cotton and edible oil will amount to more than 22.8 billion yuan. Subsidies for meat, fish, eggs, vegetables and coal for home use will amount to more than 2.4 billion yuan.

The briefing of the staff member of the Ministry of Finance evoked strong responses from deputies of the Beijing delegation. Zhao Ximing, NPC deputy and director of the Culture and Sports Department of the CYL Central Committee, said: I think the information given by the comrade from the Ministry of Finance is very important. We have the responsibility to explain and spread it among the masses of the people. The state is spending a lot of money to raise the purchase prices for agricultural and sideline products, to increase the peasants' income and to subsidize the prices of grain, edible oil, vegetables, meat, fish, eggs and other agricultural and sideline products needed by people in cities. This fully reflects the superiority of the socialist system.

Xu Qingwen, NPC deputy and national model workers, said: Since the 3d plenary session of the 11th CCP Central Committee, we peasants have deeply felt that the agricultural situation is excellent and there is reason to work hard, that economic policies have been implemented and we can rely on them, and that the harder we work, the greater the development. We feel that prospects are bright.

Zhang Binggui, NPC deputy and national model worker, said: From behind the counter I can clearly see how the people's living standards have improved. At our department store building, television sets, radios, wristwatches, woolen goods, woolen blankets and other high- and medium-grade goods are more and more welcomed by customers. Not only city workers and staff members are buying. Quite a few peasants from the suburbs and other places are also coming to make purchases. This shows that the state has made great efforts to improve the people's livelihood and has achieved remarkable results.

CSO: 4006/166

XIZANG NPC DEPUTIES VIEW IMPACT OF ZHAO REPORT

OW100648 Beijing XINHUA Domestic Service in Chinese 1203 GMT 8 Dec 81

[Text] Beijing, 8 Dec (XINHUA)--In the past few days, the deputies of Xizang autonomous region attending the Fifth NPC's fourth session have been earnestly discussing Premier Zhao Ziyang's government work report. In connection with Xizang's realities, the deputies spoke glowingly of the excellent situation in economic construction and deepened their understanding of the significance of the 10 principles of economic construction and the principle of readjustment, restructuring, reorganization and upgrading. They felt confident of the motherland's future and Xizang's prospects.

The deputies said: Premier Zhao Ziyang's report is inspiring and full of substance. It not only expounds upon China's remarkable economic achievements in the course of readjustment and the 10 principles for future economic construction but also analyzes the present difficulties and problems and lays out the prospects for China's economic development. The deputies were satisfied with the basic balance of financial and credit revenues and expenditures. They said: It was previously believed that in China, a big nation with 1 billion people afflicted by the poison of the left, it would be difficult to overcome the huge financial deficits that occurred in the past 1 or 2 years. It is beyond our expectations that the revenues and expenditures should be basically balanced within such a short time. This is remarkable indeed.

Speaking of Xizang's situation and changes over the years, the deputies said: Since implementing the guidelines contained in the central authorities' relevant document last year, Xizang has extensively popularized production responsibility systems in agriculture and stockbreeding, greatly aroused the masses' enthusiasm and promoted the development of agriculture and animal husbandry. The situation is gratifying. This year, despite serious droughts that affected agriculture and widespread snowstorms that hit animal husbandry, performance in agriculture and animal husbandry has been relatively good. Rapid progress has also been made in diversified economy. The gross and per capita income in Xizang this year will considerably surpass those of last year. Some impoverished areas have doubled their incomes within a year. The people have markedly improved their living and undergone tremendous changes in their mental outlook. They have full confidence that they can conquer poverty to become rich.

In their discussions the deputies used numerous facts to show the gratifying changes in Xizang. In Nagu Prefecture's Baqen County, which is located 4,600 meters above sea level, an extraordinary snowstorm the like of which has not been experienced in decades hit three of the seven districts in December last year. The peasants and herdsmen overcame difficulties, helped tide the animals over the crisis and registered high yields of butter, wool and milk residue. Some herdsmen that lived in tents for years have built new houses. Some of them have savings deposits of more than 10,000 yuan.

In the past, under the influence of the left Shannan Prefecture's Zhanang County abolished sideline production, which was considered a vestige of capitalism. Earning a livelihood became more and more difficult for peasants and herdsmen and the county was well known for its poverty. Since the implementation of flexible policies and restoration of sideline production the people have increased their incomes. Many commune members have built new houses. A peasant household was able to come up with 7,000 yuan in cash offhand to build a house worth 20,000 yuan. As the peasants' purchasing power increases radio receivers, tape recorders and sewing machines become popular.

The deputies also voiced their opinions concerning the 10 principles for future economic construction. Some deputies said: The 10 principles are comprehensive and specific. They conform to China's conditions and suit Xizang. The principle "depend on policies and science to accelerate agricultural development," in particular, has tremendous significance for Xizang. The deputies said: To promote agriculture and animal husbandry it is necessary to actively practice and gradually perfect production responsibility systems in their various forms, firmly rely on the party's policy and develop agriculture and animal husbandry by adopting measures suited to local conditions. Some deputies also said: The state has attached importance to the development of consumer goods industry and further readjusted heavy industry's service orientation. This conforms to the people's aspiration. Although Xizang has few branches of industry, it should try to make full use of the existing industries and run them well. In no way should Xizang get along by relying solely on state support. Xizang has many milk cows but still has to secure milk powder from the interior. We should earnestly sum up experience and find a proper way to develop Xizang's industry.

In their discussions, the deputies presented opinions and suggestions in connection with the 10 principles for economic construction and Xizang's realities. The deputies said: While increasing the production of high- and medium-grade goods needed by the society, we should never overlook the production of popular small commodities that do not yield high profit but are needed by the masses. The production of commodities specially needed by minority nationalities is too important to be overlooked. It is necessary to create new designs, improve quality, lower prices and avoid only going after profits. They hoped that departments concerned would incorporate the production and supply of special commodities for minority nationalities (such as tea, hats for formal occasions and golden-edge silks) into the state plan and sign contracts with enterprises concerned for 5 years or more to enable the enterprises to organize production and supply in accordance with the stipulations of the contracts.

Concerning energy and transportation, the deputies said: These two things are all the more important for Xizang. Transportation in Xizang is very poor. Trucks are still the major means of transportation. Civil aircraft are few and outdated. Xizang has rich mineral deposits. Its chromite, borax and copper are all urgently needed by the state. They are also good commodities for exports to earn foreign exchange. However, due to underdeveloped transportation and other limitations, these mines have not been exploited. To help Xizang develop politically, economically and culturally, to strengthen national defense and to enable Xizang to contribute its share to the motherland's four modernizations as soon as possible we suggest that the construction of railways linking Xizang to the interior be included in the state plan and that the existing civil aircraft in Xizang be upgraded.

LIAONING NPC DEPUTIES DISCUSS ZHAO ZIYANG REPORT

OW131100 Beijing XINHUA Domestic Service in Chinese 0818 GMT 8 Dec 81

[Excerpts] Beijing, 8 Dec (XINHUA)--The NPC deputies from Liaoning discussed Premier Zhao Ziyang's report on the government's work in the light of actual condition in the province.

NPC Deputy and Governor Chen Puru, citing the changes in five aspects of the economic situation in Liaoning, explained that the analysis of the economic situation in China over the past year made by Premier Zhao in his report conforms to reality and that our national economy has indeed embarked on the road of steady development.

The deputies offered some views and suggestions concerning how to improve the economic work. Deputy Zhang Shengji said: In renovating old enterprises, it is necessary to use advanced technology in order to raise the production efficiency, save money and conserve energy. He also suggested that in carrying out technical renovation, it is necessary to allocate funds for anti-pollution engineering projects. The present method of imposing fines on enterprises which discharge pollutants still cannot solve the pollution problem. Deputy Li Xun said: Speeding up the circulation of funds is the most important thing for improving the economic management. As a foreign saying goes, time is money--we must tap financial sources by speeding up the circulation of funds.

Deputy Li Songtang urged the government to limit the export of steel billets. It is necessary to fully utilize our country's blooming capability and roll steel billets into steel products for exports in order to earn more foreign exchanges. It is also necessary to curb the export of scrap steel and insure domestic supply first. He pointed out that in the past few years we have continuosuly reduced the scale of the production of steel and steel products in the country while exporting steel billets and importing steel products. This is a question that merits our study.

Deputy Jiang Peilu said that with its coastal location, beautiful scenery, complete industrial departments and convenient land and sea transportation, Dalian Municipality is endowed with favorable conditions for foreign investment. He hoped that the government will approve Dalian Municipality as a special district as soon as possible.

Deputies Qian Lingxi, Zhang Guoshi and Guo Hefu said: There must be legislation for investment in educational undertakings.

It is necessary to set up a department to unify the work of scientific research, suggested Deputy Li Xun at a group meeting. He said: At present, the scientific personnel from five departments--the Chinese Academy of Sciences, the National Defense Scientific and Technological Commission, institutes of higher learning, localities and departments--are scrambling for research projects. They concentrate the efforts on projects that others are working while ignoring subjects that others also ignore, thereby blockading research information from each other and counteracting each other's efforts. The State Scientific and Technological Commission has failed to unify the research work. Why has the superiority of our socialist system not been brought into full play? It is because of the decentralization.

Some deputies made suggestions on the building of socialist spiritual civilization.

NINGXIA DEPUTIES DISCUSS ZHAO'S NPC REPORT

OW101003 Beijing XINHUA Domestic Service in Chinese 1410 GMT 7 Dec 81

[Excerpts] Beijing, 7 Dec (XINHUA)--The Ningxia deputies attending the NPC meeting warmly discussed Premier Zhao Ziyang's report on the work of the government.

They pointed out: Since the third session of the Fifth NPC, Comrade Zhao Ziyang has made many achievements in leading the State Council. The State Council has seriously implemented the important policies of continuing economic readjustment and achieving more political stability as laid down by the CCP Central Committee. It has taken a series of effective measures and done a large amount of efficient work to eliminate very large deficits. It has also basically achieved a balance of revenue and expenditure, stabilized the economy as a whole and brought about the beginning of steady economic development in China. This fully shows that the leadership of the State Council is strong. The people of various nationalities in Ningxia completely trust the leadership of the Party Central Committee and State Council.

Ma Qingnian, Ma Xin, Li Yun and other deputies said: The 10 principles for economic construction set forth by Premier Zhao in his report were not formulated easily. They were formulated after we corrected the influence of leftist thinking on the economic work and after summing up the experience of nearly 3 years of practice. They also include the summing-up of our experiences and lessons gained during the 32 years since the founding of the PRC. They completely conform to China's situation and the socialist objective law of economy.

The deputies urged the state to include the harnessing of the Huanghe in the state capital construction plan.

The deputies also discussed how to take advantage of Ningxia's rich coal deposits. Ningxia has an abudance of coal resources and has the capability to produce 10 million tons of various types of superior coal annually. The deputies suggested that the State Council should solve the transport problem and ship the more than 1 million tons of mined coal out of Ningxia as soon as possible to support national construction.

SHANXI NPC DEPUTIES STUDY ZHAO WORK REPORT

OW110101 Beijing XINHUA Domestic Service in Chinese 1312 GMT 8 Dec 81

[Excerpts] Beijing, 8 Dec (XINHUA)--In studying Premier Zhao Ziyang's report on the work of the government, the deputies of the Shanxi delegation attending the fourth session of the Fifth NPC said that the more they read Premier Zhao Ziyang's report, the more enthusiastic they feel.

Deputy Huo Shilian said: In his report on the work of the government, Premier Zhao Ziyang pointed out that emphasis must be placed on the exploitation of coal resources in Shanxi. This has greatly inspired and encouraged us. We must exert strenuous efforts in resolutely fulfilling the glorious tasks assigned the people in Shanxi by the CCP Central Committee and the State Council. It is earnestly hoped that the State Planning Commission, the State Economic Commission, the Ministry of Coal Industry, the Ministry of Finance, the Ministry of Railways and other departments concerned, as well as the fraternal provinces and municipalities will give us their great support and assistance.

He said: In order to increase coal production, we must do a great deal of work closely connected to coal production. The first is railway transportation. At present, coal accounts for 84.5 percent of the total freight. We are unable to export many other important supplies. In April of this year, Vice Premier Wan Li personally came to Shanxi to study transportation problems. He helped us overcome some major difficulties. To basically solve problems in transportation, it is necessary for the state to make investments to repair some railways. The second involves the public facilities for coal mines. Arrangements must be made to build schools, hospitals and stores in an overall manner. The third is the supply of farm and sideline products, particularly the supply of vegetables. For this, agricultural production must also be promoted. The fourth is water sources. The fifth is the comprehensive utilization of coal by doing a good job in coal liquefaction and gasification.

Deputy Ruan Bosheng talked about the economic situation in Shanxi. He said: In general Shanxi's economic situation conforms with Premier Zhao Ziyang's analysis of the national economy. First of all, we have a fine situation in agricultural production. Production responsibility systems have been enforced in 86 percent of the production brigades in our province, thus whipping up the peasants' enthusiasm for farming. Despite this year's serious drought, our province still registers an increase of summer crops as compared with last year. The growth of autumn crops this year is also not worse than that of last year. The fine situation in agriculture is the major trend. From now on, we must further consolidate and improve the responsibility systems. This is extremely important. The industrial production situation for the first 6 months of this year was not satisfactory. The situation in the second half of the year has gradually taken a favorable turn, thus reversing the passive position. Shanxi's heavy industry accounts for 70 percent of the total industry in the province. Therefore, we still need to solve the major issue of whom our heavy industry serves in industrial production in addition to our efforts to step up the production of daily necessities and coal.

Deputies Zhao Yuting and Shi Huaibi said: Premier Zhao's report has followed the principle of seeking truth from facts and proceeded from China's state of affairs. It is difficult to understand a nation's state of affairs. We have suffered many setbacks and committed "left" errors in the course of socialist construction simply because we fail to clearly understand our nation's state of affairs. The greatest feature in the work of our Party Central Committee and State Council today is to proceed from the actual conditions. This year natural disasters affected 533 million mu of land in the whole country. Some 260 million mu were seriously affected. More than 130 million people have suffered from natural disasters (Shanxi Province is not included). However, we still reaped a good harvest this year and the situation is quite favorable. We have scored this achievement by relying on policy and science. We mainly rely on policy.

SHANGHAI NPC DEPUTIES HAIL ZHAO ZIYANG'S REPORT

OW110229 Beijing XINHUA Domestic Service in Chinese 1804 GMT 7 Dec 81

[Excerpts] Beijing, 7 Dec (XINHUA)--The members of the Shanghai delegation attending the fourth session of the Fifth NPC held panel discussion meetings in the past few days to discuss Premier Zhao Ziyang's report on the work of the government. All the deputies freely expressed their views in a buoyant atmosphere.

Hu Lijiao, NPC deputy and second secretary of the Shanghai Municipal CCP Committee, said: Premier Zhao's analysis of the present national economy entirely conforms with the situation in Shanghai. The situation in Shanghai remains favorable [compared with] other localities in China. Shanghai's total industrial output value this year is expected to increase by 3 percent as compared with last year. There are marked increases in the production of consumer goods. In heavy industry, we have readjusted the service orientation and the product mix. Metallurgical, chemical building material and other industrial departments have offered definite contributions to the supply of raw materials and equipment for the production of consumer goods. Shanghai's trade situation is also good this year in both domestic consumption and export. From January to October the total value of daily necessities and industrial products shipped out of Shanghai to various localities throughout the country has reached 9.2 billion yuan, marking an increase of 6.3 percent as compared with the same period last year.

Liu Nianzhi, NPC deputy and vice chairman of the All-China Federation of Industry and Commerce, said: In the past, I studied capitalist economics abroad. Despite the fact that there are many economists holding doctoral degrees in economics and many foreign experts are invited to tackle problems, capitalist countries still cannot solve their economic problems. Our nation is large and has a population of one billion. In the past few years, we have had many problems because of the disproportions in our national economy. However, after we implemented the principle of making readjustments, our deficit dropped to this year's 2.7 billion yuan. This is not an easy task. Each of the 10 principles put forward by Premier Zhao from agriculture to industry and from science to culture and education takes the interests of the people into consideration.

The Shanghai deputies also put forward constructive suggestions on urban construction, developing agriculture, changing organizational structures, and on developing education, science and research work. Zhao Zukang, NPC deputy and deputy mayor of Shanghai, suggested that it is necessary to correctly handle the relationships between urban construction, economic construction and social construction and to develop such relationships in a coordinated manner.

Liu Funian, NPC deputy and president of the East China Teachers University, and Rong Yiren, NPC deputy and vice chairman of the National CPPCC Committee, stressed the need to transform government structures. Rong Yiren said: If the government structures are not changed and government organs still dispute over trifles, it is impossible to transform the economic system. In my present work, the problem of government organs disputing over trifles gives me a number of headaches. Liu Funian said: To change the government structures, we should not only simplify the administration and reduce the staff, we must also change the situation by which the government departments responsible for the work rigidly control everything and exercise their authority in all events either major or minor.

Several deputies including Sun Daguang, Zhang Wenyu and Su Buqing expressed their views on the fact that there are many scientific research institutes in China with scattered scientific and technical forces and not closely connected with education and production. On the basis of the fact that there are not enough scientists and technicians in factories and industrial enterprises while there are many scientists and technicians in the Academy of Sciences and various departments of the Science and Technology Commission for National Defense with some idle, Zhang Wenyu suggested that the scientists and technicians of the Academy of Sciences and the various departments of the Science and Technology Commission for National Defense be linked to those in factories, enterprises and institutions of higher learning. Su Buqing also suggested that universities set up a 4-year system and a 2-year system to train people of all types. College students who have graduated from the 2-year colleges can be generally assigned to work in factories in order to raise the technical level and production efficiency of an enterprise. They can also be assigned to teach in middle schools.

HUNAN'S MAO ZHIYONG HAILS CCP CENTRAL COMMITTEE

OW091223 Beijing XINHUA Domestic Service in Chinese 1751 GMT 7 Dec 81

[Excerpts] Beijing, 7 Dec (XINHUA)--During panel discussions, the Hunan provincial delegation attending the fourth session of the Fifth NPC discussed Premier Zhao Ziyang's report on the work of the government.

They unanimously held: The report has summed up the present excellent economic situation, predicted the bright future of China's economic development and clearly pointed out the orientation and the way for our future efforts. It is unadorned, comprehensive and is with depth and insight, giving people great inspiration and education.

Mao Zhiyong, first secretary of the Hunan Provincial CCP Committee and deputy to the NPC, said: The excellent economic situation shows that the important policy decision made by the Party Central Committee and the State Council on achieving further economic readjustment and political stability is completely correct. It shows that the broad masses of people and cadres of various nationalities throughout the country highly trust the Party Central Committee and the State Council, that they have made strenuous efforts to implement the important policy decision of the Party Central Committee. It shows that the socialist system in China is incomparably superior, that it is entirely possible to accomplish the goal of the four modernizations step by step and stage by stage, and that any pessimism, disappointment and lack of confidence are groundless.

The deputies unanimously supported the 10 principles for economic construction set forth by Premier Zhao in his report.

While reviewing the excellent situation, the deputies also made some constructive suggestions.

Zhou Minghong and Chen Guoda said: China is not paying as much attention to intellectual development as the economically developed countries do. This is unwise and a very big mistake. The government should do its utmost to invest more money in educational undertaking and intellectual development.

Tang Lijun, Kuang Zeilan, Liao Xingchu, Tang Liqun and other deputies said: A new situation and new problems have occurred and the birth rate is rising after the government promulgated the new marriage law and implemented the system of economic responsibility in the countryside. We hope that the government enacts the family planning law as soon as possible in order to use the law to control population increases. Otherwise, it is very hard to implement family planning.

NPC Deputy Wen Xinzheng said: Hunan is a land of non-ferrous metal and its mineral resources are a great value. However, these resources are not well protected as some peasants are doing unauthorized mining in mining districts and causing serious damage to mineral resources. According to a preliminary investigation by nine mining districts under six tungsten mines, usually there are 4,000 peasants entering the mining district to mine without authorization and the number will rise to 6,000 during slack farming seasons, outnumbering the mine workers there. Moreover, accidents constantly happen in those several mines, causing some 2,609 deaths in 1981. We suggest that the government enacts the mineral resources protection law as soon as possible. In the meantime, it is necessary to immediately take resolute administrative measures to save the mines.

SHAANXI DEPUTIES DISCUSS ZHAO'S NPC REPORT

OW101125 Beijing XINHUA Domestic Service in Chinese 1316 GMT 7 Dec 81

[Excerpts] Beijing, 7 Dec (XINHUA)--Over the last few days, the Shaanxi provincial delegation attending the fourth session of the Fifth NPC seriously discussed Premier Zhao Ziyang's report on the work of the government. The deputies unanimously said they were greatly inspired after listening to the report. They held the discussion in connection with the economic readjustment and the delightful situation on various fronts in Shaanxi.

They held: Premier Zhao Ziyang's thesis that China's national economy has begun a steady development entirely conforms to reality. The guiding thought on making further readjustment set forth by the Party Central Committee is correct. The economic development is sound and the achievements are remarkable. Since the readjustment tasks are arduous and we have been distressed by serious natural disasters, it is very unusual that we have made such good achievements.

Deputy Yu Mingtao said: Continuous heavy rains resulted in bad floods in areas west of the Qinling and Bashan Mountains and in Hanzhong Prefecture in Shaanxi during the fall of 1981. With the kind attention of the Party Central Committee and the State Council, and under the leadership of the Provincial Party Committee and provincial government, the broad masses of cadres, CCP and CYL members and people in the flooded areas shared weal and woe in waging an indomitable struggle against the floods. They also persevered in restoring production and in relief work. Many leading cadres who braved danger and provided good leadership and many heroic model persons who disregarded their own safety to save other's lives and protect state and collective property emerged. The PLA members advanced the glorious tradition of supporting the government and cherishing the people. They raced with time to save people's lives and property and repair highways, railroads, dams and unsafe sections of river dikes. They also helped to restore the electric power supply and communications and to maintain social order. The people praise and love them for their important contributions. The struggle to combat floods and provide disaster relief shows that the party organizations at all levels are strong in fighting power and that the great majority of cadres and CCP and CYL members can stand the test. It also fully shows the superiority of socialism.

During panel discussions, the deputies warmly discussed the 10 principles for future economic construction.

They held: The 10 principles suit China's situation and show the spirit of seeking truth from facts, stressing efficiency, acting according to our capabilities and working hard. If we follow them, we surely can accomplish the four modernizations step by step and stage by stage.

While happily reviewing the situation and discussing the principles, the deputies also made some comments and suggestions on questions concerning industrial readjustment, agricultural production and correction of unhealthy tendencies.

CSO: 4006/166

HEBEI DEPUTIES ENDORSE ZHAO'S NPC REPORT

OW091039 Beijing XINHUA Domestic Service in Chinese 1637 GMT 8 Dec 81

[Excerpts] Beijing, 8 Dec (XINHUA)--The 122 deputies from Hebei Province attending the fourth session of the Fifth NPC have wholeheartedly endorsed Premier Zhao's report on the government's work. They pointed out that the report has correctly analyzed the current economic situation, incisively summed up the experience in economic construction and explicitly put forth the 10 principles and expounded the prospects for economic development. The report is completely in line with the actual condition in China and coincides with the people's aspirations and demands.

During the course of discussion, the deputies made some suggestions:

1. It is necessary to take resolute measures to check the unhealthy tendency in literary and art propaganda work.

Deputy Wang Jian said: The Party Central Committee and State Council have time and again called for launching the "five stresses and four beauties" campaign, actively learning from Lei Feng and educating the young people with socialist and communist ethics, social values and attitude toward physical labor. However, some people in the literary and art circles have not followed the central authorities' policy on creative works and have acted exactly the opposite. Some works contain evil in both content and form.

2. It is necessary to strengthen the building of the contingent of political and judicial personnel and learn to use legal means to maintain economic order.

Deputy Han Bangju said: Of late, various evil practices and crimes have become rampant in economic life. In safeguarding the socialist material civilization and in flourishing the socialist spiritual civilization, we must strengthen the building of the contingent of political and judicial personnel and learn to use legal means to maintain economic order. It is imperative that we step up the work on economic legislation. Because of inadequate economic laws we are still using the regulations regarding the punishment of embezzlers, which were adopted in the 1950's, in handling economic crimes. Many of the regulations are out-of-date. The organization of forces to speedily formulate economic rules and regulations is urgently needed.

3. It is necessary to streamline organs, overcome bureaucracy and change the cadres' work style.

Deputy Han Rongji said: As Premier Zhao pointed out in his report, bureaucracy in our current political life and economic administration is a serious obstacle to taking a new road in the development of the national economy and to building the four modernizations. The State Council has decided to start the reform in the departments under the State Council and instructed them to complete the reform within a specified time in order to set an example for local governments at various levels. This is an important question and must be tackled without delay.

I believe that in order to successfully solve this question, it is necessary to, first of all, continue to criticize the "leftist" line, eliminate the chaos and restore the order and effectively reduce the size of government organs in combination with the work to readjust leading bodies. Second, provincial government must emulate the central authorities in playing the exemplary role for prefectural and county governments. Third, it is necessary to make adequate arrangements for veteran cadres and enforce the cadres retirement system. Fourth, it is necessary to formulate a national "organization law" for streaming and unifying administrative organs.

XIZANG ALI PREFECTURE IMPLEMENTS WORK INSTRUCTION

HK081356 Lhasa Xizang Regional Service in Mandarin 1130 GMT 6 Dec 81

[Text] The party and government cadres of Ali Prefecture have conscientiously studied and implemented the regional CCP Committee's instruction on work in Ali Prefecture and pledged to unify their thinking, brace themselves and promote work in all fields.

After the regional CCP Committee's instructions on work in Ali Prefecture were passed down, the Ali Prefectural CCP Committee immediately called an enlarged Standing Committee meeting. Comrades attending the meeting studied and discussed the regional CCP Committee's instruction. They enthusiastically said: The eight-point instruction of the regional CCP Committee will be the embodiment, in Ali Prefecture, of the line of the 3d plenary session of the 11th CCP Central Committee and of the Central Committee's instructions concerning work in Xizang. It is a very important document which will determine Ali Prefecture's future efforts to alleviate poverty and bring about prosperity and will guide work in the whole of Ali Prefecture. It conforms completely with the actual conditions in Ali Prefecture.

They unanimously expressed: Through study and implementation, we must further eliminate leftist mistakes, emancipate our minds, unify thinking, brace ourselves and carry out the important instructions of the Central Committee on work in Xizang and the instruction of the regional CCP Committee on work in our prefecture in a down-to-earth manner. We must resolutely implement the new economic policies in order to bring about a big production increase in animal husbandry and agriculture in the whole prefecture, a substantial improvement in the people's livelihood and a fundamental change in the state of pverty and backwardness. We must strive for successes in satisfying the needs of the people of Ali Prefecture and make greater contributions to the state.

On 21 November, the Ali Prefectural CCP Committee held a rally in Shiquanhe. The rally was attended by party and government officials, armymen and civilians. At the rally, Comrade (Miao Shiqing), secretary of the Prefectural CCP Committee, transmitted the regional CCP Committee's instruction on work in Ali Prefecture. On behalf of the Prefectural CCP Committee and the prefectural administrative office, he also called upon the cadres, staff and workers and masses of peasants and herdsmen to actively go into action and whip up a great upsurge in studying, publicizing and implementing the instruction of the regional CCP Committee.

CSO: 4006/166

INDIVIDUAL ECONOMY CONSIDERED NECESSARY IN CITIES, TOWNS

Kunming JINGJI WENTI TANSUO [INQUIRY INTO ECONOMIC PROBLEMS] in Chinese No 5, 1981 pp 29-34

[Article by Xi Guizhen [1153 2710 3791] and Yang Xian [2799 8300]: "On the Objective Necessity and Nature of Individual Economy in Cities and Towns"]

[Text] Since the Third Plenary Session of the 11th Party Central Committee, individual economy has been rapidly reactivated and developed in the cities and towns of our country. By the end of May 1981, 4,015 households and 4,306 persons in Beijing municipality had already obtained business licenses for individual industrial or commercial activities. The number of these households is 71 percent more than that by the end of 1980, and even exceeds that of 1957. From this, we can anticipate further development of individual economy in the near future.

Why should there be still individual economy on the socialist great soil of our country? What is the nature of individual economy? Will it breed capitalism? If we cannot find scientific answers to these questions, it will be difficult for us to handle individual economy in cities and towns properly.

Existence of Individual Economy in Cities and Towns Determined by Present Productive Forces in Society

Since the basic completion of the socialist transformation of private ownership of the means of production in our country, individual economy in cities and towns has taken a tortuous path, and for quite a long time people have looked down on it as a "heresy" which socialism could not tolerate, or as a "capitalist tail" to be proscribed. Yet despite its setbacks, individual economy has not been "exterminated" after all. Like the sturdy grass on the mountain cliff, it continues to flourish. This clearly shows that when the socialist economic system of public ownership has been completely established and remains predominant, the existence of individual economy is still an objective necessity. To illustrate this point according to the law of the correspondence of production relations to the characteristics of the productive forces, it is necessary for us to start from the material foundation of a socialist society.

As we all know, in the socialist society envisaged by Marx and Engels, individual economy does not exist, and there should be only one single system of social ownership in the whole society. Laborers are directly integrated with the means of production in the society so that everyone should be an owner of the means of production and every laborer should have equal rights and responsibilities in the use of public-owned means of production. Unemployment would be unheard of, and social products are to be distributed under a unified plan throughout the society. Actual developments have gone beyond the expectation of Marx and Engels, because victory for socialist revolution was first won in a country with a backward capitalist economy. Building socialism in such a country encountered many extraordinary and complex problems and difficulties which Marx and Engels had not anticipated. When victory for the revolution was won in our country, the development of productive forces and the socialization of production were at a very low level, and small-scale production was still preponderant. It was therefore impossible to set up a single system of social ownership for the entire society, and in addition to the coexistence of the system of collective ownership and the socialist system of ownership by the whole people, there is also individual economy.

Individual economy exists in the cities and towns of a socialist society because the laborers are not yet completely integrated with the means of production within the scope of the economic system of public ownership, which is restricted by the level of productive forces. Under the socialist system, labor is a means of livelihood, and in connection with labor, there are such questions as material benefits, equal remuneration for equal amounts of labor, and "he who does not work shall not eat either." Laborers must have the means of production to work with. Marx clearly pointed out: "Whatever the social form of production, laborers and means of production always remain factors of it. But in a state of separation from each other, either of these factors can be such only potentially. For production to go on at all, they must unite."[1] It is beyond doubt that in socialism, there must be sufficient means of production before all the laborers can have equal rights and responsibilities in work. When the socialist economy system of public ownership has been set up and remains preponderant, the laborers working in state-run enterprises or collective enterprises basically symbolize the integration of laborers and the means of production. However, because the material and technical foundations for the socialist system of public ownership at this stage are still weak, it is not yet possible for all laborers to become integrated with the means of production through the socialist economic system of public ownership, and a large number of people are unemployed. Although the constitution stipulates that every laborer has the right to work, such a stipulation cannot be carried out under the socialist economic system of public ownership in the near future because of the restrictions of the low level of social productive forces. In this case, the unemployed naturally have to find their own means of livelihood by acquiring the means of production with self-raised funds and to work under the system of individual ownership. Such is the innate source of vitality for individual economy which cannot be "exterminated" in cities and towns.

Another condition for the existence of individual economy in cities and towns is that the socialist economy system of public ownership is not yet powerful enough to permeate the entire social economic life, and there are still many "empty spaces" left.

Individual economy in cities and towns can take many forms, such as peddling along the streets and lanes, door-to-door delivery, and so forth, according to the consumers' requirements. Repairing shoes and bicycles in the streets, repairing furniture, radio sets and TV sets in the customers' homes, and so forth, are services rarely, or never, offered by the state-run or collective enterprises. These services, therefore, play a positive role in filling the gaps left by the economic system of public ownership at least for the time being. For example, two retired tailors in Haiding District of Beijing municipality continued their profession at home. Their work was good and prompt. A young couple were planning a travel wedding, and the wedding gown was completed in 3 days. These tailors thus won public approbation. Now, they are so busy with their work on hand that they dare not publicly display their signboard. Again, in the remote area of Beiwu of Yuquanshan in Haiding District, there was no state-run or collective restaurant, and an individual-run restaurant began to operate. Its business was so brisk that orders for its deep-fried dough cakes had to be placed 1 day ahead. The supplementary role of individual economy for the economic system of public ownership is an indication that its economic form is appropriate for our productive forces at their present stage of development.

We can imagine that individual economy will continue to play this supplementary role even though the total social productive forces develop to a higher level, and the socialist economic system of public ownership greatly expands with a firm material and technological foundation. By that time, individual economy may be reduced or even eliminated in some spheres, but it may also develop and become more widespread in other spheres. The reason is that in certain forms of economic life, the nature of small unrelated repair jobs, small service trades, and the procurement of sundry mountain products and native products creates the need for small-scale or even individual business. Only thus can the various wants of consumers be satisfied. Along with the development of productive forces and the progress of socialization in production, the standard of specialization and division of work in industry will also be further raised, and some large industrial enterprises may assign to individual laborers the tasks of producing small quantities of accessories or spare parts for their products. The widespread existence of individual mechanized family industry and individual chicken farms in certain economically advanced countries nowadays is an eloquent proof of this theory.

From this, we can see that for a fairly long time to come in our country, the existence and appropriate development of individual economy in cities and towns is unavoidable. This is determined by the state of development of social productive forces and is in line with objective laws which are independent of the wishes of people. If individual economy is arbitrarily abolished even though conditions are not yet ready, it will not only cause great inconvenience to people's economic life but will also be detrimental to social stability and unity and to the development of the socialist economy as a whole.

Individual Economy as a Subordinate and Supplement to Socialist Economic System of Public Ownership in Cities and Towns of Socialist Society

What is the character of individual economy in cities and towns under the socialist system? Some people hold that the character of individual economy is determined by the character of the dominating economy to which individual economy owes its existence in society. Under the capitalist system, it has a capitalist character, and under a socialist system, it has a socialist character. This view deserves discussion.

To correctly understand the character of individual economy in cities and towns, it is our opinion that we should first grasp its inherent basic characteristics. Individual economy in cities and towns is a kind of small commodity economy. On the one hand, the means of production and the products belong to the individuals; on the other hand, individual economy is based on individual labor and does not call for exploitation of other people. Besides working personally, the individuals in some cases have to train their apprentices and such training is also a form of labor. Thus the part of their remuneration in excess of the reward for their direct labor is for the production techniques which they have passed on to their apprentices. The products and labor of individual economy are intended for the acquisition of the means of livelihood in exchange. Throughout the long, long history of mankind, individual economy has existed in the slave society, the feudal society, the capitalist society and the socialist society. As an economic form, however, it has never been in a dominant position; it has survived only as an appendage to the dominant economic form.

In a capitalist society, individual economy is subordinate to capitalist economy, but we cannot come to the conclusion that its character is capitalist simply on this this account. The special features of capitalist economy are the capitalists' private ownership of the means of production and the exploitation of the surplus value produced by the workers. Individual laborers have no hired hands and do not exploit others. Since they live on the fruits of their own labor, how can there be any capitalist character to speak of? It is true that according to the law of value and the rules of competition, individual economy may give rise to polarization. However, before the polarization, the small-scale producers are still laborers and not capitalists. If we say that individual economy in a capitalist society has a capitalist character because of its subordination to capitalist economy, then, according to the same line of reasoning, the individual economy in a slave society has the character of slave economy, and individual economy in a feudal society has the nature of feudal economy. This kind of logic is absurd.

Then what is the character of individual economy in the cities and towns of a socialist society? Can we call it socialist? One of the features of socialist economy is the system of public ownership of the means of production. When we want to determine whether an economic system is socialist, we have to see whether it has the feature of public ownership, whether the laborers work with public means of production, and whether the fruits of labor are shared by all laboring people. As mentioned before, individual economy under the socialist system is an economic system of small private ownership, and the fruits of labor are at the disposal of the laboring individuals. Apparently, it does not have a socialist character.

Individual economy in the cities and towns of our country is an economic form under conditions of a predominant socialist economy of public ownership. Its business activities are subject to the influence and restrictions of socialist economic laws. That is why it is different from the individual economy of the past. Marx said: "In every social formation, there is a specific kind of production which predominates over all the others and whose relations therefore determine their rank and influence. It is a general illuminant tingeing all other colors and modifying their specific features."[2] In a capitalist society, individual economy is subject to the influence and restrictions of capitalist economic laws, and under conditions of ruthless competition and anarchy, a small number of small-scale producers may rise as capitalists, but the vast majority of them may sink to the level of hired hands. Although the socialist economy of public ownership was established before the socialist transformation of the system of private ownership of the means of production in our country, capitalism still remained extensively in urban and rural areas, and individual economy found itself at a crossroad. It could either develop into capitalist economy or become socialist economy through the cooperative movement. When the socialist transformation was basically completed, however, the brilliant illumination of the socialist economic system of public ownership gave individual economy in cities and towns the following main features:

First, since individual economy could survive and develop through its subordination to the socialist economic system of public ownership, this economic system became the base of its activities. Under existing conditions in our country, the equipment, tools and raw materials required by individual industrial or commercial households are mainly supplied by the economic system of public ownership, and only a small part of them can come from village fairs. The majority of them are directly sold to the consumers, but a fairly large portion of them are procured by state-run and collective commerce as a supplement to, and a component of, the socialist economic system of public ownership.

Second, there are restrictions on the sphere of individual economic activities. Although individual households engaged in industry and commerce, as independent producers of commodities, are in many ways connected with the free market, they are nevertheless restricted by state planning. Through economic means or the necessary administrative methods, such as the formulation of policies and decrees, the relevant state departments functioning under the system of public ownership can strengthen their leadership over these individual households, keep their business activities within bounds, and direct them into the channels of socialist economic development.

Furthermore, the class status of individual laborers has also undergone a great change. At present, most of those engaged in individual industry and commerce are unemployed youths, unorganized laborers and a small number of retired workers. The overwhelming majority of them are law-abiding and support the party and socialism.

In sum, individual economy in the cities and towns of a socialist society are dependent on the socialist economic system of public ownership, as a subordinate and supplement to the socialist economy.

Here, it should also be mentioned that the subordination of individual economy to the socialist economic system of public ownership refers only to the subordinate position it occupies in the national economy. This does not imply that the relationship between the state-run enterprises and the individual industrial or commercial households is one between the ruler and the ruled. Instead, their relationship should be one of mutual cooperation. Since both individual economy in the cities and towns and the socialist economic system of public ownership are commodity economy, and the economic relationship between them is through the medium of commodity, the cooperation between them is naturally manifested in the exchange of equal values as well as competition. Even though individual economy in cities and towns is subordinated to the socialist economic system of public ownership, the individual laborers, as small commodity producers, can act as independent commodity producers in their dealings with state-run enterprises or collective enterprises. In supplying equipment and raw materials to the small commodity producers and in procuring products from them, the public-run enterprise should uphold the principle of exchange of equal value. Since the relationship between individual industrial or commercial households and the public-run enterprises is one of commodity relationship, there is naturally competition between them. The workers and staff members of certain public-run enterprises have looked upon the reactivated and developed individual industrial or commercial households as their business rivals and have withheld the supply of raw materials to the individual households, destroyed their vending stalls, ransacked their homes, torn down their shop fronts, and resorted to various illegal acts in an attempt to wipe out their competition by forcible means. The relationship of equal rights and benefits was turned into a relationship between "monarch and vassals." This is not only a violation of the objective economic law, but also a deviation from the character of socialist economic system of public ownership. The public-run enterprises should work hard to improve their own business management and to strengthen their own competitive power through the production of low-price and fine-quality goods as well as offering better services. These enterprises and the individual industrial or commercial households should learn from and encourage each other in a common effort to bring prosperity to the socialist economy and to satisfy the wants of the people.

Impossibility of Individual Economy in Cities and Towns Under the Socialist System Breeding Capitalism

When the socialist transformation of the system of private ownership of the means of production has been basically completed, will the existence and development of individual economy to a certain extent breed capitalism? This is another important question in handling individual economy in cities and towns.

In his book "Economic Problems of Socialism in the USSR," Stalin said: "Commodity production must not be regarded as something sufficient unto itself, something independent of the surrounding economic conditions."[3] Since the birth of small commodity economy in the later stage of the primitive society, there were no capitalist production relations throughout the long periods of slave society and feudal society. This was determined by the economic conditions of the society. Small commodity economy at that time continued to bring about polarization; however, because of the dominant position of the natural economy, some small producers who had gone bankrupt sank down to the level of slaves or serfs, but not hired hands, while those with money in hand could only become slave owners or landlords, but not capitalists of the present age. It was not until the late feudal society that, on the basis of the expansion of commodity production and commodity exchange, two conditions were available for the birth of capitalist production relations. The two conditions were: first, the large concentration of money and the means of production in the hands of a small number of people; and second, the emergence of a large number of people owning nothing but personal freedom. It was only under these conditions that small commodity production could be transformed into capitalist production, and that the capitalist production relations could make their appearance. As Stalin said: "Commodity production leads to capitalism only if there is private ownership of the means of production; if labor power appears in the market as a commodity which can be bought by the capitalist and exploited in the process of production; and if, consequently, the system of exploitation of wage earners by capitalists exists in the country."[4] Obviously, such conditions are incomplete in a socialist society. In our country at present, no land can be freely sold; the majority of production means required for the individual economy come from the socialist economic system of public ownership; and its business activities are generally conducted within the scope previously prescribed by the state, with neither addition nor alterations permitted. The conditions of production and the business results among the individual industrial or commercial households may be different and may bring about a difference in their incomes; however, under the predominance of the socialist economic system of public ownership and given the series of party and government policies, decrees and the necessary administrative measures, it is generally impossible for huge amounts of money to be accumulated by a small number of individuals, and, at the same time, they cannot buy machinery and equipment at will. Particularly in a socialist society, labor power is no longer a commodity, while the labor rights of workers and peasants are protected by the state, so that they can never become hired laborers. Under such circumstances, money cannot be turned into capital. As we can see, the socialist system does not provide the conditions for the birth of capitalist economy, and individual economy in cities and towns generally cannot develop into capitalism.

In an attempt to prove that small-scale production in a socialist society can produce polarization and then breed capitalism, some comrades have quoted this passage from Lenin: "Small production engenders capitalism and the bourgeoisie continuously, daily, hourly, spontaneously, and on a large scale." This passage was quoted from Lenin's "'Left-Wing' Communism, an Infantile Disorder" written in April-May 1920. At that time, the Soviet Union was in the transitional period from capitalism to socialism, and the small-scale producers, like a huge ocean, had not been organized and were at a crossroad of capitalism and socialism. Under these special historical conditions, Lenin's statement was undoubtedly correct. Today, in our country, the socialist transformation has already been completed, and conditions in various respects are different from those of the Soviet Union at that time. We would be making a far-fetched comparison if we arbitrarily applied the concept from Lenin to the small-scale producers when the socialist system of public ownership remains predominant.

Of course, we do not mean to deny that individual economy in cities and towns is not without certain elements of spontaneity and rashness. Small commodity is now an antiquity in a socialist society, while the labor of small commodity producers is, on the one hand, social labor carried out for the production (of circulation) of commodities for the society under conditions of social division of labor, and on the other hand, private labor carried out as a means of livelihood under conditions of private ownership on a small scale. The contradiction between social labor and private labor is still manifested as the contradiction between the use value and the value of commodities. The business activities of small-scale producers are largely governed by the law of value, and therefore inevitably have a spontaneous capitalist tendency, which is manifested in real life in many forms, such as setting up vending stalls without licenses, cheating in work and materials, adulteration of inferior materials, using short weights and measures, and increasing prices at will. These practices, if allowed to continue, may possibly give birth to capitalism. We must be soberly aware of this situation and adopt forceful measures to check the spontaneity. For example, we can control the scope and orientation of their business through such channels as material supplies and bank credits; proscribe unlicensed vending stalls through administrative methods; and attack and apply sanctions on speculation, profiteering and other illegal activities through legislation, in order that individual economy in cities and towns will develop along socialist economic channels and play a more active role.

At present, we should continue to eliminate the "leftist" poison from the individual economy in cities and towns; give it the necessary support through loans, taxation, and material supplies; protect the legitimate rights, including the property and personal freedom, of individual industrial and commercial households from infringement; raise the political and social status of these households; and see to it that these people and their sons and daughters are not unfairly discriminated against in applying for admission to the party and the league, in joining the army and in entering a higher school. This will stimulate the business activism in individual economy in cities and towns and help it develop properly.

GEOLOGICAL WORK MUST BE IMPROVED FOR BETTER ECONOMIC RESULTS

Kunming JINGJI WENTI TANSUO [INQUIRY INTO ECONOMIC PROBLEMS] in Chinese No 5, 1981 pp 44-47

[Article by Jiang Weilin [1203 3634 7027]: "How To Improve Economic Results in Geological Work"]

[Text] Stress on economic results should be the focus of socialist social economic management. Geological departments are the forerunners in national economy, entrusted with the task of underground exploration. In geology, the discovery of good or bad mines has a very important bearing on national economic development. Successful geological work will provide fairly dependable mineral resources of good quality and evenly distributed over different areas. The work should also be of low cost and able to provide worthwhile geological data. In short, it should help accelerate the four modernizations. If the reverse is the case, it will be a waste of state construction funds and become a "stumbling block" in the path of the four modernizations.

China is one of the few countries in the world with a fairly complete assortment of minerals, and Yunnan is one of the provinces with fairly good geological mineralization conditions and a fairly complete assortment of minerals, including nonferrous metal, ferrous metal, coal, phosphorus, asbestine, platinum and palladium, all with fairly rich deposits. More than 100 different kinds of useful minerals have been discovered and the deposits of 74 of them have been verified. The verified deposits of lead, zinc, tin and asbestine rank first among all provinces and regions in the country, and those of copper, platinum, palladium and phosphorus also occupy the upper ranks, thus basically meeting the needs of national construction.

Do these advantages indicate good eocnomic results in geological work? The answer is "no." Because of the "leftist" mistakes, particularly the interference and sabotage by Lin Biao and the "gang of four" over a long time, geological work has not been carried out according to objective laws, and there is a tendency to neglect economic results in geological work and in discovering mines. This is a fatal weakness in geological work. Poor economic results in geological work or in discovering mines are mainly shown in the following ways: 1) If we compare the expenditure of labor (including living labor and materialized labor) and the labor time with the results in geological work, there is a problem of heavy labor consumption and long construction periods. For example, even in prospecting the iron and copper deposits in the Dahong Mountain of Xinping County, Yunnan, which has yielded fairly good results, more than 1,000 persons were mobilized, some 40 million yuan was spent, and 16 years were required before detailed prospecting and detailed survey, culminating in a preliminary prospecting report, could be accomplished. In addition to repeated setbacks encountered in other mining sites, there have also been instances of lack of coordination, vying for ore fields and duplication of work, all causing great waste. 2) Judging from the results of geological work in the light of exploitation and utilization by the state, we see that the number of discovered mines ready for state exploitation and utilization is quite small, while the number of those which have to be left idle and unused is quite large. According to statistics, in Yunnan regarding 14 principal mineral products, including coal, iron, tin, copper, lead and zinc, reports have already been submitted on 505 mining sites with the amount of deposits verified. Up to now, only 199, or approximately 39 percent, of them has been exploited and utilized. In terms of verified amounts, the utilization rate is only 37 percent, and more than 60 percent of the verified deposits and ore fields cannot be exploited and utilized for some time to come.

According to historical experience, stress on the economic results in geological work should be based on a study of the relationship between input and output (consumption and results); the relationship between work intensity and a shortened work period; and the relationship between results in geological work and the exploitation and utilization to be carried out. Failure to study these relationships has been one of the important causes of our poor economic results for a long time.

To improve the economic results in geological work, we must earnestly study and solve the following problems:

First, the relationship between state construction requirements and the observance of geological laws should be correctly handled. Geological departments have to serve national economic development and should regard the requirements of national economic development as their starting point as well as end result. This is decided by the socialist basic economic laws and is a concrete embodiment of the policy of determining production according to marketing (demand) among the geological departments. Furthermore, we must be aware that mineral resources, as objective things, are subject to the laws of geology in both time and space. The role of geological work is only to explore and understand them; it is incapable of transforming or changing their material forms of existence. To obtain the expected results in geological work, we must strictly observe the laws of geology.

The requirements of the state and the observance of geological laws should be well coordinated, because none of them can be neglected. For this reason, we must divide the entire process of geological work into advanced and late stages according to its different characteristics and special features, and pay attention to both stages. Regional geological survey, scanning of materials, general mining survey, demarcation of mineralization zones and forecast of long-lasting deposits belong to the advanced stage of geological work. According to its special features, this stage is basically one of research and forecasting, and no mature data can be offered directly for exploitation and utilization. It calls for intensive intellectuals and technical effort, but no heavy investment and labor for "saturated" engineering. At this stage, therefore, greater emphasis should be laid on the observance of geological laws, and the state can provide only general guidance instead of setting any tight restrictions. Prospecting, especially detailed prospecting, belongs to the late stage of geological work. The special feature of this stage is that there will be mature data to be used directly for exploitation and utilization, and, relatively speaking, intensive use of funds and labor is required. Therefore, the work should be carried out selectively under necessary state restrictions, and mining zones under prospecting, particularly detailed prospecting, should have the following requisites: 1) Ores of relatively good and up-to-standard quality for selection and smelting; 2) state plan for exploitation including the assignment of a design unit; 3) proven economic value after feasibility study; and 4) reasonable demand on the extent and intensity of prospecting and the guaranteed number of years, based on the exploitation requirements. If these four requisites are in order, it will be possible for the huge amounts of funds and labor expended in geological work to be recovered fairly quickly in the form of investment returns. In the course of work, of course, the procedures of geological prospecting should also be strictly followed.

Second, the guiding thought with geological work and mine discovery as the central task should be upheld and the relationship between means and end should be properly handled. The end of geological work is to clarify the geological situation, to ascertain the mineral resources, and to meet the requirements of state construction. The methods used in geological work, such as geophysics and geochemistry; the use of drills, tunnels, wells and pits, remote sensing and other technical methods for analysis, appraisal, and comprehensive research are all means to the end. For many years, the relationship between means and end has been reversed in the practice of geological work. As a result of the confusion between means and end, certain erroneous slogans, such as "taking drilling as the key link," "taking drilling as the dragon head" and so forth, gained currency. In the plans handed down to the lower levels, the footage of drilling instead of the results in geological work was used as an index of investment returns. For this reason, there was frequent bickering resulting from the attempt to increase the workload regardless of the economic results. In evaluating a plan, the drilling footage again was used as an index. A unit having fulfilled or overfulfilled the quota of drilling was considered as having fulfilled or overfulfilled the plan. If the end of geological work was attained with a reduced drilling footage, this performance was not considered as being in line with the practice of economy, but on the contrary a failure to complete the plan, for which even enterprise funds might be withheld. There was a complete set of plans and indexes for the evaluation of the means, but not for the end. This reversal of means and end brought about serious consequences, such as blindly spreading out the drilling points and one-sidedly striving for increased drilling footage. These problems were attributed to factors of understanding, work and system, but mainly to the system.

In view of these problems, since 1979 the Yunnan Provincial Geological Bureau has gradually reorganized the present geological contingent--formerly run as a package deal--in accordance with the principle of specialization and coordination, by separating the work of geological survey from that of drilling and construction, to suit their different characteristics and features. Professional geological teams are organized according to the conditions of geological resources, to undertake the tasks of investigations and study in geology and mineral resources, and to submit various geological reports to the state. For prospecting, special prospecting engineering teams are formed to operate as enterprises. These teams will undertake the jobs of drilling, tunneling and other construction tasks given them by the geological teams, practice enterprise management and independent accounting, and assume responsibility for profits and losses. Through these preliminary reforms, the geological teams will be able to concentrate their efforts on the discovery of mines, while the prospecting teams can likewise devote their entire energy to engineering management and research. This will put an end to the internal disputes over means and end in geological work and encourage careful calculation and strict budgeting in the use of manpower for the discovery of mines as an end in geological work. Unnecessary drilling will then be reduced by a wide margin.

Although a clear goal has been set in geological work, there are still other problems--such as how to manage and evaluate geological work in the light of its strong points in exploration and scientific research so that it will bring about better economic results--requiring further study and solution.

Third, the relationship between the state, the collective and the individual economic benefits should be correctly handled in accordance with the principle of material benefits. Material benefits are also economic benefits. However, the relations of economic benefits are the foundation of all social relations, since no society whatsoever cannot be without the element of individual material benefits. Because of the "leftist" mistakes for many years, stress was laid only on the benefits of the state, while collective and individual benefits were dismissed in both theory and practice. Lin Biao and the "gang of four" positively rejected the principle behind material benefits and brought about the disintegration of the economic benefits of the broad masses of cadres and people, the interests of the state and the business results of enterprises. Thus socialist enterprises lost their innate driving force. This is a serious lesson for us.

Since 1979, when the geological contingent was reorganized according to the principle of specialization and coordination, the Yunnan Provincial Geological Bureau has proceeded with the reform in the system and methods of economic management, and has carried out preliminary experiments with a series of new systems and methods, including the systems of design budgets, economic contracts, profit-sharing, sharing of savings from the practice of economy, opening new avenues of resources, sharing net benefits, setting prices for prospecting engineering according to the quality of work, payment for the use of fixed assets and circulating funds and others, totaling 12 new systems, on the basis of which appropriate funds were set up for the development of production by enterprises and for the workers' fringe benefits and bonuses. In a nutshell, all these measures of reform were based on an organic integration of the economic benefits of the state, the collective and the individual, and the integration of the worker's economic benefits with the unit's business results according to the principle of material benefits. By this means, the leadership of the enterprise and the broad masses of workers will be concerned with the enterprise's business results not only for political reasons, but also out of consideration for their own economic benefits. This has helped enliven microeconomics under the guidance of macroeconomics, and thus stimulated the innate driving force of the enterprises, so that everyone will be concerned with the management of finances, and eager to increase the sources of revenue and to practice economy. There is now a marked rise in various technical and economic indexes, and the quality and efficiency of various engineering jobs, the revenues and the savings from reduced consumption have all reached unprecedented levels. In 1980, compared with 1979--when the plans were fairly well carried out--the efficiency of drilling platforms was raised by 31 percent and the rate of fine-quality holes was raised by 23.5 percent. Because of reduced production costs, the expenses on geological prospecting for the whole year were reduced by 2,008,700 yuan, twice the amount of saving in 1979. The amount of circulating funds used was also reduced by 19 percent, and as a result of increased avenues of revenue, the income in 1980 was 3.15 times that of 1979. Facts have thus proved that the principle of material benefits cannot be ignored. Any attack on or denunciation of this principle is unreasonable.

Of course, these measures of reform cannot be perfect at present, and the following tasks should be carried out for further improvement: 1) Immediate action should be taken on the work of designing in different phases, on the basis of which a budget should be worked out. This budget will serve as the principal criterion for calculating the share of profits to be used as bonuses. 2) A clear and easily understood index system should be set up after due study for evaluating the results of geological work. 3) A set of economic management methods should be worked out after careful study. These methods should be suitable for the index system for evaluating the economic results of geological work and capable of integrating the economic benefits of the state, the collective and the individual. Furthermore, in view of the exploratory and variable nature of geological work, some methods should also be devised for the distribution of economic benefits among the state, the collective and the individual in a way suitable for this exploratory and variable nature. If these problems are solved, it will be possible to achieve better economic results in geological work. 4) Forecasting and policy decisions must be carefully carried out in geological work. In the history of geology and geological work in Yunnan, incalculable damage has been caused by faulty policy decisions and other errors. We should take our lessons from this experience and strengthen our work in this respect. Forecasting and policy decisions, as a branch of science and technology for economic management, have their own specific substances, procedures and laws. For geological work, the forecasting and policy decisions should include the study of geological laws (including the study and forecasting of mineralization zones and their long-lasting deposits); the accumulation, study and analysis of historical data (including the accumulation, study and analysis of technical and economic data); the collection of economic data, the economic feasibility study in mineral deposits, the analysis and forecasting of the prospects of state exploitation and utilization, and the investigation, analysis and forecasting of social needs. Then on the basis of a comprehensive balance of past and future factors, forecasting and policy decisions should also include long-range and short-range plans and arrangements, study of the scope of manpower to be used and of various internal structures. In carrying out these tasks, we should fully utilize system theory, mathematical statistics, probability theory, numerical models, network technology, and other scientific and technical methods in order to work out not only quantitative but also qualitative comparative analyses, for the choice and correct decision of the policy decisionmakers.

In sum, forecasting and policy decisions are important factors which cannot be ignored. However, they also tax people's energy. If well done, they will be of great help in improving the economic results of geological work.

BRIEFS

HUBEI DEPUTIES DISCUSS NPC REPORT--Beijing, 7 Dec (XINHUA)--During panel discussions over the last few days, the Hubei provincial delegation attending the fourth session of the Fifth NPC discussed Premier Zhao Ziyang's report on the work of government. The deputies happily reviewed the excellent current situation, discussed the 10 principles for future economic construction and expressed their views on some real problems. While discussing the principles for future economic construction, the deputies emphasized the necessity to pay attention to the key issue of enhancing economic results. Deputies Zhang Xiulong and Lin Musen said: At present, waste is a very serious problem in many fields. The progress of all capital construction projects, big and small, is repeatedly delayed, constantly requiring additional funds. The central authorities have again and again called for an end to repetition in construction, but some localities and departments still continue to approve and build extraneous projects. In industry, management is poor and people only pay attention to output value and disregard quality and marketability of products. The deputies also expressed views on simplifying the administrative structure and stabilizing commodity prices. [Excerpts] [OW102335 Beijing XINHUA Domestic Service in Chinese 1822 GMT 7 Dec 81]

ECONOMIC PLANNING

INPUT OUTPUT METHOD, USES EXPLAINED

Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 9, 15 Sep 81
pp IX70-76

[Article by Chen Xikang [7115 6932 1660], Systems Institute, Chinese Academy of Sciences: "Input Output Method and Economic Work"]

[Text] Summary

There are many kinds of mathematical methods and models in economies. The input output method is a fairly well-developed one, and a method that has found wide-ranging application in many countries. What is the input output method? By input we mean the consumption involved in doing an economic activity. In the production process, for example, the various raw and processed materials, supplementary materials, energy, machines, and equipment are all inputs to production activity. Output refers to the results from these economic activities. As a result of production activities, for example, a certain quantity of goods are derived, and these goods are the output. There is a definite quantitative regularity between input and output in these economic activities. For instance, in the case of most products, within a relatively short time the quantity of input per unit of output, i.e. the quantity of consumption of various input factors (raw and processed materials, energy, equipment, and manpower) per unit of product produced remains relatively stable. This is because in the case of most products, the numerous factors in the quantity of input that decide output per unit--things such as technological levels, management levels, and resource conditions--cannot undergo any fundamental change within a short period of time. In some units, quantity of input per unit of output may be inconsistent, but the changes have definite regularity. In agriculture, for instance, where because of the limitations of the amount of land, in order to produce a larger amount of farm products from the same amount of cultivated land, the input per unit of farm product of fertilizer, electric power, and diesel fuel steadily increases. For instance, in 1957 for every 10,000 jin of grain produced in China, approximately 92 jin of chemical fertilizer and 3.1 kilowatt hours of electric power were consumed. In 1965, approximately 378 jin of chemical fertilizer and 80 kilowatt hours of electricity were consumed. In 1970, approximately 549 jin of chemical fertilizer and 165 kilowatt hours of electricity were consumed, and in 1980, approximately 1,480 jin of chemical fertilizer and 402 kilowatt hours of electricity were consumed.

The input output method entails use of mathematical methods and electronic computers to study the quantitative relationships between input and output for various forms of economic activity. This method has a great number of advantages for the scientific planning, forecasting, and analysis of economic activities. This method was born during the 1930's in the United States. It was put forward in 1936 by American economist Lieanjiefu [phonetic] and was inspired and influenced by a national economic balance sheet for 1923/1924 published by the USSR. In 1936, Lieanjiefu published an article titled, "Quantitative Relationships Between Input and Output in the American Economic System." In 1941, he published a book titled, "Structure of the American Economy, 1919-1929," and in 1953, he published another book titled, "Study of the American Economic Structure." In these works, Lieanjiefu put forward input output method theories, and used statistical data on economic performance published in the United States to construct input output tables for the United States economy in 1919, 1929, and 1939.

During World War II, input output methods began to win serious attention. In 1944, the United States Bureau of Labor Statistics used the input output method to predict what changes would occur in the employment situation in the United States during December 1945 were World War II to end on 30 June 1945. Study was made at that time of the 1939 input output tables formulated by Lieanjiefu and others. Because this method was felt to be superior to traditional methods, following World War II, the Bureau of Labor Statistics in the United States Department of Labor, in cooperation with the United States Airforce, spent $1.5 million and assembled between 50 and 75 people to compile an input output table for the United States economy in 1947. Subsequently, the United States compiled input output tables for 1958, 1963 and 1966.

During the 1950's, a mania for compiling input output tables developed in capitalist countries. Following America's lead, Western European countries and Japan first compiled input output tables. Next, developing countries, the USSR, and Eastern European countries also began to compile input output tables. Incomplete statistics show that in 1960 approximately 60 of the countries of the world had compiled input output tables. In 1979, approximately 90 countries compiled input output tables.

During the early 1960's, some scientific research organizations and institutions of higher learning in China began research in this regard. At that time, they mainly publicized, introduced and theoretically explored input output methods. In some enterprises, however, work was begun on the compilation of input output tables.

In 1974, at the instigation of the Systems Institute[1] of the Chinese Academy of Sciences, the National Statistical Commission and the State Statistical Bureau invited some units to began to compile an input output table for China's national economy in 1973. This table was successfully completed in 1976. During the next several years, input output methods were applied to the study of national economic planning.

---

1. Formed from some Research Offices of the Former Institute of Mathematics

In June 1980, six scientists from the Systems Institute proposed to State Council leaders the compilation of new national economy input output tables, as well as the use of input output techniques in planning work. This suggestion met with the support of leadership comrades in the State Council, and now the units concerned are engaged in organizing its implementation.

In addition to national input output tables, the Shanxi Provincial Bureau of Statistics in cooperation with relevant units, is in process of compiling prefectural input output tables for Shanxi Province. The Academy of Chemical Industry Planning and Design of the Ministry of Chemical Industries has compiled input output tables for chemical industry units in 1978. The Anshan Steel Company and other enterprises have also compiled input output tables for their enterprises.

2. Basic Structure of Input Output Tables

Before applying input output methods to economic analysis and planning work, it is necessary first of all to compile an input and output table for a reporting period on the basis of the year's actual statistical data. The basic structure of an input output table is as follows:

Table 1. Input Output Table Units: 100 million yuan

		Industry	Agriculture	Other	Total	Investment	Consumption	Total	Total Product
Production Sector	1. Industry	1000	200	100	1300	400	300	700	2000
	2. Agriculture	200	100	50	350	50	600	650	1000
	3. Other	200	100		300	100	100	200	500
	Total	1400	400	150	1950	550	1000	1550	3500
	Fixed Assets Depreciation	60	20	20	100				
Newly Created Value	Labor Compensation	200	400	200	800				
	Social Net Earnings	340	180	130	650				
	Total	540	580	330	1450				
	Total Products	2000	1000	500	3500				

Table 1 is an input output flow table, or an input output table for short. For purposes of simplicity, the table contains only three sectors, namely industry, agriculture, and other sectors. An actual input output table includes several sectors or several hundred sectors. For instance, an American input output table for 1963 contained 367 sectors. A USSR output table in 1966 contained 110 sectors. A Japanese input output table for 1965 contained 156 sectors. China's 1973 input output table contained 61 sectors.

Looked at in terms of levels, this table shows the economic utility of products from each sector. The products of each sector may be divided into two major groupings on the basis of their economic utility, i.e. intermediate products and end products. Intermediate products are those products requiring further processing in the production field during the present period, items such as pig iron used in making steel, steel used in the manufacture of sewing machines, pig iron, timber, etc. These objects for labor, which are to be used in further production processes, looked at in terms of the overall society, are in an intermediate processing stage. They are materials in the process of manufacture or semi-manufactured goods, so they are called intermediate products. In Table 1, 130 billion yuan of the 200 billion yuan output value in the industrial sector is for intermediate products. Industrial products used in the industrial sector itself are worth 100 billion yuan; those used in the agricultural sector are worth 20 billion yuan; and those used in other sectors are worth 10 billion yuan. Agricultural products for use in the industrial sector are worth 20 billion yuan. This includes items such as cotton used for textiles, and sugar plants used for the crushing of sugar etc. Agricultural products for use in the agricultural sector itself are valued at 10 billion yuan. These include seeds, livestock feeds, etc. Agricultural products used in other production sectors are valued at 5 billion yuan. Agriculture's intermediate products total 35 billion yuan in value.

End products are those whose final processing has been completed in the production field during the present period, and are products that may be provided society for consumption and use. This includes consumption items used for the personal consumption of residents or consumption by society collectively, products used to augment storage and as national reserves, products used to increase fixed assets, and products used in net exports. In Table 1, end products in the industrial sector have a value of 70 billion yuan. End products in the agricultural sector have a value of 65 billion yuan.

The total of intermediate products and end products is equal to the grand total of all sectors. In Table 1, for the industrial sector, we have: (1000 + 200 + 100) + 700 = 200 billion yuan. For the agricultural sector we have: (200 + 100 + 50) + 650 = 100 billion yuan.

A look at the vertical direction of the input output table shows the value structure of products from each sector. The value structure of products may be divided into two large categories. The first category is the transferred value of embodied labor. This is formed from the means of production consumed in the goods' production process, and includes raw and processed materials, supplemental materials, and energy consumed, as well as depreciation of fixed assets. The second category is newly created value, which includes compensation for labor and various forms of social net earnings such as profits, taxes, and interest. In Table 1, the first column shows the value structure of products in the industrial sector. In the production of 200 billion yuan of industrial products, 100 billion yuan worth of products from the industrial sector itself were consumed; 20 billion yuan of products from the agricultural sector were consumed; and consumption of products from other sectors amounted to 20 billion yuan. Depreciation of fixed assets amounted to 6 billion yuan. The transferred value totaled 146 billion yuan. Industrial output value comprised 20 billion yuan of compensation to labor, and 34 billion yuan as social net earnings. Thus, the grand total was equal to the output value of the industrial sector. We have (1000 + 200 + 200 + 60) + 200 = 340) = 200 billion yuan. Similarly for the agricultural sector we have (200 + 100 + 100 + 20) + (400 + 180) = 100 billion yuan.

In the interest of simplicity, Table 1 contains only three sectors. For general purposes, imagine it contains several sectors. We use X_{ij} to stand for the quantity of i sector products consumed in j sector's production process. If X_{21} represents the quantity of second sector products consumed in the first sector's production process, X_i represents the product output of i sector. If X_i represents output of the first sector, Y_i represents the output of final products by i sector. If Y_i stands for the final product output by the first sector, by using these symbols, a look at the input output table in terms of the direction of levels gives the following balanced relationship:

$$\begin{cases} X_{11}+X_{12}+\cdots+X_{1n}+Y_1=X_1 \\ X_{21}+X_{22}+\cdots+X_{2n}+Y_2=X_2 \\ \cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots \\ X_{n1}+X_{n2}+\cdots+X_{nn}+Y_n=X_n \end{cases} \qquad (1)$$

Using D_i to stand for the amount of depreciation of fixed assets by j sector; using V_j to represent the amount of remuneration for labor in j sector; and using M_j to represent the amount of social net earnings in j sector, looked at in terms of the vertical direction of the input output table, we have the following relationship:

$$\begin{cases} X_{11}+X_{21}+\cdots+X_{n1}+D_1+ \\ \quad V_1+M_1=X_1 \\ X_{12}+X_{22}+\cdots+X_{n2}+D_2+ \\ \quad V_2+M_2=X_2 \\ \cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots \\ X_{1n}+X_{2n}+\cdots+X_{nn}+D_n+ \\ \quad V_n+M_n=X_n \end{cases} \qquad (2)$$

3. Direct Consumption Coefficients

By direct consumption coefficients is meant the quantity of direct consumption of products from each sector per unit of product produced by a sector. In foreign economics literature, direct consumption coefficient is also termed technical coefficient or technical input coefficient. Let us use a_{ij} to represent the quantity of i sector's products consumed in the process of producing a product by the j sector of a unit. The formula for making calculations is:

$$a_{ij}=\frac{X_{ij}}{X_j} \qquad (i,j=1,2,\cdots,n) \qquad (3)$$

In Table 1, if in the process of producing industrial products, 20 billion yuan of agricultural products are consumed, the output of industrial products is 200 billion yuan, i.e. $X_{21} = 200$, $X_1 = 2{,}000$, thus:

$$a_{21} = \frac{X_{21}}{X_1} = \frac{200}{2000} = 0.10$$

For the Table 1 example, we obtained the following direct consumption coefficient table:

Table 2. Direct Consumption Coefficient Table

	Industry	Agriculture	Other
1. Industry	0.5	0.2	0.2
2. Agriculture	0.1	0.1	0.1
3. Other	0.1	0.1	0

From formula (3) we can derive

$$X_{ij} = a_{ij} X_j \qquad (i,j = 1,2,\cdots,n) \tag{4}$$

Substituting formula (4) for formula (1), we have

$$\begin{cases} a_{11}X_1 + a_{12}X_2 + \cdots + a_{1n}X_n + Y_1 = X_1 \\ a_{21}X_1 + a_{22}X_2 + \cdots + a_{2n}X_n + Y_2 = X_2 \\ \cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots \\ a_{n1}X_1 + a_{n2}X_2 + \cdots + a_{nn}X_n + Y_n = X_n \end{cases} \tag{5}$$

Formula (5) may be written in matrix form as

$$AX + Y = X \tag{6}$$

This is the most basic series of balance equations for input output. Here A is n's step matrix; X and Y are n's only vectors.

$$A = \begin{bmatrix} a_{11}a_{12}\cdots a_{1n} \\ a_{21}a_{22}\cdots a_{2n} \\ \cdots\cdots\cdots\cdots \\ a_{n1}a_{n2}\cdots a_{nn} \end{bmatrix}, \quad X = \begin{bmatrix} X_1 \\ X_2 \\ \vdots \\ X_n \end{bmatrix}, \quad Y = \begin{bmatrix} Y_1 \\ Y_2 \\ \vdots \\ Y_n \end{bmatrix}.$$

With reference to the Table 1 example, we have

$$\begin{cases} 0.5X_1 + 0.2X_2 + 0.2X_3 + Y_1 = X_1 \\ 0.1X_1 + 0.1X_2 + 0.1X_3 + Y_2 = X_2 \\ 0.1X_1 + 0.1X_2 \qquad\qquad + Y_3 = X_3 \end{cases}$$

From formula (6) can be derived

$$X - AX = Y$$

$$(I-A)\ X = Y$$

Here I is n's step unit matrix. Its diagonal line element equals 1; the other elements equal 0. In input output, the inverse matrix of (1-A), $(1-A)^{-1}$ is existent. On both the left and right ends of the above formula, multiplied times $(1 - A)^{-1}$; thus we have

$(1 - A)^{-1}(1 - A)\ X = (1 - A)^{-1}Y$ from which is derived

$$X = (1-A)^{-1}Y \tag{7}$$

Once the numerical value of the vector Y for the final products of all sectors is known, by using formula (7), the numerical value of total output vector X for each sector can be derived.

Now let us apply the direct consumption coefficient to the input output table vertical direction relative formula (2). Substituting formula (4) for formula (2), we derive:

$$\begin{cases} a_{11}X_1 + a_{21}X_1 + \cdots + a_{n1}X_1 + D_1 + V_1 + M_1 = X_1 \\ a_{12}X_2 + a_{22}X_2 + \cdots a_{n2}X_2 + D_2 + V_2 + M_2 = X_2 \\ \cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots \\ a_{1n}X_n + a_{2n}X_n + \cdots + a_{nn}X_n + D_n + V_n + M_n = X_n \end{cases} \tag{8}$$

which may be simplified as

$$\begin{cases} \sum\limits_{i=1}^{n} a_{i1}X_1 + D_1 + V_1 + M_1 = X_1 \\ \sum\limits_{i=1}^{n} a_{i2}X_2 + D_2 + V_2 + M_2 = X_2 \\ \cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots \\ \sum\limits_{i=1}^{n} a_{in}X_n + D_n + V_n + M_n = X_n \end{cases}$$

The above series of formulas may be written in matrix form

$$CX + D + V + M = X \tag{9}$$

Here, C stands for the following diagonal line matrices

$$C = \begin{pmatrix} \sum_{i=1}^{n} a_{i1} & 0 & \cdots & 0 \\ 0 & \sum_{i=1}^{n} a_{i2} & \cdots & 0 \\ \cdots & \cdots & \cdots & \cdots \\ 0 & 0 & \cdots & \sum_{i=1}^{n} a_{in} \end{pmatrix}$$

D, V, and M represent the column vector for depreciation of fixed assets, the column vector for compensation of labor, and the column vector for social net earnings, respectively as

$$D = \begin{bmatrix} D_1 \\ D_2 \\ \vdots \\ D_n \end{bmatrix}, \quad V = \begin{bmatrix} V_1 \\ V_2 \\ \vdots \\ V_n \end{bmatrix}, \quad M = \begin{bmatrix} M_1 \\ M_2 \\ \vdots \\ M_n \end{bmatrix}$$

Formula (9) may also be written as $(1-C)\,X = D + V + M$

Using $(1-C)^{-1}$ to stand for the inverse matrix of matrix (1-C), it is existent. The above may be written as

$$X = (1-C)^{-1}(D + V + M) \qquad (10)$$

Formula (10) shows that once depreciation of fixed assets for each sector, the amount of compensation for labor, and the amount of social net earnings are known, one can calculate the total amount of total products from each sector.

4. Complete Consumption Coefficient

By using the input output method, one can calculate the final products of production units in each sector relative to the quantity of total consumption of other sector's products. Total consumption includes direct consumption and indirect consumption. The meaning of total consumption may be explained in terms of the various forms of consumption of electricity in making bicycles as follows:

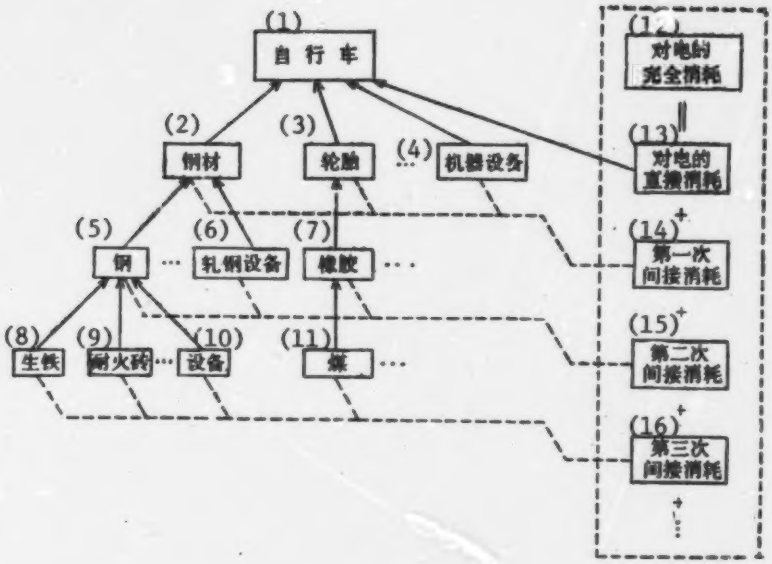

Figure 1

Key:
(1) Bicycles
(2) Steel manufactures
(3) Tires
(4) Machinery and Equipment
(5) Steel
(6) Steel Rolling Equipment
(7) Rubber
(8) Pig iron
(9) Fire brick
(10) Equipment
(11) Coal
(12) Total consumption of electricity
(13) Direct consumption of electricity
(14) Primary indirect consumption
(15) Secondary indirect consumption
(16) Tertiary indirect consumption

From Figure 1 it may be seen that electric power is consumed in the process of producing bicycles. This is the direct consumption of electric power for bicycles. However, in the production of bicycles, there is also consumption of steel manufactures, tires, machines and equipment, for which electric power was also consumed in the process of their manufacture. Since these steel manufactures and tires are used in the production of bicycles, this electric power has to be regarded as indirect consumption of electric power to make the bicycles. These we term primary indirect electric power consumption for the manufacture of bicycles. In the process of rolling steel for the steel goods, steel was consumed; in the process of manufacturing tires, rubber was consumed. In the process of producing both the steel and the rubber, electric power was consumed. This is secondary indirect electric power consumption for the manufacture of bicycles. In the process of smelting this steel, pig iron was consumed as was fire-resistant materials and metallurgical equipment. In the process of producing rubber, many products such as coal, were consumed. The production of these products consumed electric power. This is tertiary indirect consumption of electric power for the manufacture of bicycles. This process can continue ad infinitum, and we can derive countless instances of indirect consumption of electric power to manufacture bicycles. Total consumption of electric power to manufacture bicycles, on the other hand, equals the total of direct consumption of electricity for bicycle manufacture plus all this indirect consumption. Therefore, total consumption of electricity to manufacture bicycles includes not only the consumption of electric power by the bicycle plant to make steel materials at the time of bicycle manufacture, but also includes all the consumption of electric power in all the manufacturing processes that produced goods needed to manufacture bicycles. This reflects the total quantity of electricity contained in the bicycles.

The total consumption coefficient for products may be calculated on the basis of this economic concept by adding direct consumption to indirect consumption at the various times. After calculations have been made for several tens of times, the quantity of new indirect consumption becomes extremely small. The calculation process may then be halted. However, by using an electronic computer with the input output method, the numerical value of total consumption coefficients may be rapidly derived. The following formula may be used to figure total consumption coefficients.

$$b_{ij} = a_{ij} + b_{i1}a_{1j} + b_{i2}a_{2j} + \cdots + b_{in}a_{nj} \quad (i,j=1,2,\cdots,n) \tag{11}$$

Here b_{ij} stands for the total consumption coefficient of product j relative to product i, B representing the total consumption coefficient matrix.

$$B = \begin{pmatrix} b_{11} & b_{12} & \cdots & b_{1n} \\ b_{21} & b_{22} & \cdots & b_{2n} \\ \cdots & \cdots & \cdots & \cdots \\ b_{n1} & b_{n2} & \cdots & b_{nn} \end{pmatrix}$$

The set of formulas given in (11) may be written in the following matrix form:

$$B = A + BA, \text{ i.e. } B(1-A) = A, \text{ or}$$

$$\begin{aligned} B &= A(1-A)^{-1} \\ &= (1-A)^{-1} - (1-A)^{-1} + A(1-A)^{-1} \\ &= (1-A)^{-1} - (1-A)(1-A)^{-1} \\ &= (1-A)^{-1} - 1 \end{aligned} \tag{12}$$

Ordinarily we use formula (12), and on the basis of the given fixed direct consumption coefficient matrix A, we calculate total consumption coefficient matrix B.

In the Table 1 example, the direct consumption coefficient is as shown in Table 2. The total consumption coefficients of each sector as calculated with formula (12) are shown in Table 3.

Table 3. Total Consumption Coefficients

	Industry	Agriculture	Other
1. Industry	1.2084	0.5459	0.4693
2. Agriculture	0.2730	0.1911	0.1737
3. Other	0.2481	0.1737	0.0670

The first column of figures in Table 3 shows that for every 10,000 yuan of finished industrial goods, the direct and indirect amount of consumption of products from all sectors in the production process is a total consumption of 12,084 yuan of industrial products, a total consumption of 2,730 yuan of agricultural products, and a total consumption of 2,481 yuan of products from other sectors. Therefore, for every 10,000 yuan of final products from industry, the industrial sector has to produce 22,084 yuan of products (12,084 yuan of which is consumption internal to the production process); the agricultural sector has to produce 2,730 yuan of products (the entire amount being consumed in the production process), and other sectors must produce 2,481 yuan of products (consumed in the production). Similarly, the second column shows that for every 10,000 yuan of agricultural final products produced, the industrial sector has to produce 5,459 yuan of products (consumed in the production process); the agricultural sector has to produce 11,911 yuan of products (1,911 yuan of which is internally consumed in the production process); and other sectors have to produce 1,737 yuan of products (consumed in the production process).

In 1973, China had materials measuring units calculate the direct consumption factors and the total consumption factors for 61 different major goods. The consumption factors for the various major goods are shown in Table 4. The table also shows pertinent figures from Soviet input output tables for 1972 for comparison purposes.

Table 4 shows that:

1. In China's machine industries, some of the major products are comparable with the Soviet Union in consumption of raw and processed materials, the differences not being large;

2. As compared with the USSR, China's consumption coefficient for energy to produce metallurgy industry products is vastly higher. Direct consumption of electric power per ton of steel, for example, is 208 percent that of the USSR, and total consumption is 200 percent that of the USSR. Direct consumption and total consumption of electric power per ton of ferroalloys have a coefficient that is 153 percent and 144 percent respectively that of the USSR. If the energy consumption factors for China's metallurgical industry products are compared with those of the United States, Japan, and West Germany, the difference is even greater. This shows that energy waste by China's metallurgy industries is very serious and that vigorous energy conservation efforts should be launched.

The consumption coefficient for electric power per ton of raw coal in China (including medium and small coal mines) is lower than in the USSR. This is because small coal mines in which the extent of mechanization is very low account for a very large proportion of China's raw coal output.

Table 4. Direct Consumption Coefficients and Total Consumption Coefficients of Various Major Products

		China (1973)		USSR (1972)	
	Units	Direct Consumption	Total Consumption	Direct Consumption	Total Consumption
Seed consumption per 10,000 jin of grain	jin	720	777		
Processed steel consumed per bicycle	kilo	32.18	33.34		
Processed steel consumed per automobile	kilo	2487	2962	2500	3200
Processed steel consumed per machine tool	kilo	1452	1643	1300	2100
Electricity consumed per ton of aluminum	kwh	16576	18339	11154	14669
Electricity consumed per ton of ferroalloy	kwh	4976	5888	3257	4088
Electricity consumed per ton of steel	kwh	199	690	95.5	345
Electricity per ton of finished steel products	kwh	196	1146	110	549
Electricity consumed per ton of crude oil	kwh	24.6	35.1		
Coking coal consumed per ton of pig iron	kilo	728.11	742.61		
Coal consumption per ton of coking coal	kilo	1575	1681	1289	1330
Electricity consumption per ton of coal	kwh	28	34	33	37

5. Role of Input Output Tables in Economic Work

The role of input output tables may be roughly divided into two aspects, namely use in economic analysis and use in planning and forecasting.

An input output table contains and abundance of data. It is a composite balance sheet explaining economic activities and mutual relationships of every sector of the national economy during the reporting period. Use of the data on this table permits a series of economic analyses, such as calculating the structure of the social products sector, studying the value structure of social products, calculating the intermediate product rate and the final product rate (the intermediate product rate and the final product rate meaning the ratio of intermediate products or final products among all products) of each sector, studying the sector structure of final products, studying the proportional relationships of the two major categories, studying the relationship between accumulation and consumption, and studying the proportional relationship among agriculture, light industry, and heavy industry, etc.

The role in planning and forecasting of input product models has the following principal aspects:

1. Calculation of the total output value of each sector on the basis of final output value during the period of plan.

Use of input output methods in planning work requires, first of all, use of final products as the starting point for planning work. When undertaking planning work, it is necessary, first of all, to establish on the basis of the situation during the planning period, both consumption programs and accumulation programs, and one may formulate multiple final product programs for the planning period using the following formula:

$$X = (1-A)^{-1}Y \tag{13}$$

After calculating the total output of each sector, one should consider whether on the basis of productive capacity, natural resources, and the workforce situation whether it is possible during the period of plan to produce these total products, and then, on the basis of the situation, to revise, as necessary, the final product plans and programs.

For example, in the case of the Table 1 example, we hypothesize the quantity of final products from each sector for the period of plan as follows:

Table 5. Final Products Program for Plan Period

	Investment	Consumption	Total
Industry	430	370	800
Agriculture	60	640	700
Other	120	130	250
Total	610	1140	1750

Using formula (13), we can calculate the total products of each sector as follows:

$$\begin{bmatrix} X_1 \\ X_2 \\ X_3 \end{bmatrix} = \begin{bmatrix} 2.2084 & 0.5459 & 0.4693 \\ 0.2730 & 0.1911 & 0.1737 \\ 0.2481 & 0.1737 & 0.0670 \end{bmatrix} \begin{bmatrix} 800 \\ 700 \\ 250 \end{bmatrix} = \begin{bmatrix} 2272.95 \\ 1095.53 \\ 586.85 \end{bmatrix}$$

This means a planned output value of 227,295,000,000 yuan for industry, 109,553,000,000 yuan for agriculture, and a planned output value of 58,685,000,000 for other sectors. On the basis of the foregoing final products plans and programs, we can derive the following plans and programs (see Table 6).

Table 6. Plan Input Output Table Units: 100 million yuan

	Intermediate Products				Finished Products			Total Products
	Industry	Agriculture	Other	Total	Investment	Consumption	Total	
Industry	1136.47	219.11	117.37	1472.95	430	370	800	2272.95
Agriculture	227.29	109.55	58.69	395.53	60	640	700	1095.53
Other	227.30	109.55	0	336.85	120	130	250	586.85
Total	1591.06	438.21	176.06	2205.33	610	1140	1750	3955.33
Depreciation of Fixed Assets	68.19	21.91	23.47	113.57				
Compensation paid labor	227.30	438.21	234.74	900.25				
Social net income	386.40	197.20	152.58	736.18				
Total	613.70	635.41	387.32	1636.43				
Total Products	2272.95	1095.53	586.85	3955.33				

2. Checking whether existing plans and programs are balanced and coordinated in the proportions for each sector and in the proportions of products.

If input output methods were not used in the compilation of existing national economic plans, we can use these methods to check whether or not the proportional spread among sectors and among products is right, thereby guarding against serious imbalances cropping up. Reportedly, many national and regional input output tables compiled in the USSR are used to check the balance of existing plans and programs. Input output tables played a role in this regard, for example, in the case of 1962 plans for the Beyelorussian Republic, and in the 1965 plan for Georgia. Many of the input output tables compiled by Eastern European countries also function as a check on whether national economic plans are balanced in apportionments to various sectors, e.g. the input output table for Bulgaria's 1964 plan, the input output table for Hungary's 1956 and 1970 plan, and the input output table for Czechoslovakia's 1970 plan, all of which served this function.

3. Use of input output methods to study the effects on the economy resulting from adoption of a major economic policy. The United States, for example, has used input output methods to study the effects of the adoption of different energy policies on the speed of economic growth and on employment. It also used input output methods to study a 20 percent reduction in American military disbursements, and the effect on output value in various sectors and various regions of the United States on their transfer to civilian use. The results of this study showed that where a 20 percent cut in military disbursements transferred to civilian use, the output value of certain sectors such as the aviation industry and the military armaments industry, and the research and

development sector would decline by 16.05 percent, 15.42 percent, and 13.26 percent respectively, while the output value of the agricultural sector, and of the consumer goods and civilian services sector would increase.

4. Use of input output methods to study methods of calculating product value and product prices, as well as to study the effects on the prices of products from each sector resulting from changes in wages or changes in the price of energy. For example, the United States has used input output methods to calculate the rate of increase in the price of goods from all sectors resulting from a 10 percent increase in wages. At this time, the prices of construction industry products rose most, and following a 10 percent increase in wages, living costs increased about 3.8 percent, the actual benefit gained by staff and employees thus being only 6.2 percent.

5. Use of input output methods for economic forecasting. An instance was the United Nations compilation of a world input output model to forecast development of the world economy up to the year 2000. In England, compilation of trend models for numerous sectors in Cambridge permitted forecasting of economic development for England from 1978 to 1990.

6. Use of input output methods to study pollution problems, employment problems and population problems, as well as the overall balance in the internal output and energy of enterprises, etc.

FISCAL CHECK UPS REPORTED IN THE OFFING IN SHAANXI

Xian SHAANXI RIBAO in Chinese 1 Nov 81 p 2

[Article: "Provincial Financial Commission Sets Criteria for Major Inspection and Examination of Revenues"]

[Text] In order that major checkup of revenues will truly play a role in taking financial and economic discipline seriously, improve administration and management, and promote increased revenues and conservation in expenditures, the Shaanxi Provincial Finance and Trade Commission recently set criteria for a major inspection and examination of revenues, and decided that provincial level units would be examined by the Provincial Finance Bureau acting in conjunction with the departments responsible for work, and that prefecture, municipal, and county units would be examined by pertinent departments organized by the local people's governments.

There are six criteria for examination:

1. Whether all state organizations, enterprises, facilities, taxpaying units and individuals have increased their national sense and the concept of the law, regard seriously and obey financial and economic discipline, are law abiding, practice strict economy, work hard and practice thrift, pay taxes in accordance with regulations, and promptly turn over to higher authority profits and depreciation funds.

2. Full clarification of arbitrary squezing or pocketing of funds, interception of state revenues, arrears on payment of taxes, profits, or depreciation funds, as well as tax evasion or default in payment of taxes. Whether all public revenues (taxes, profits, and depreciation funds) have been paid into the treasury in accordance with policy stipulations. In cases where single sum payments would work a hardship, whether a plan for installment payments have been worked out.

3. In the case of those units or individuals who have already been found to have used various methods to embezzle state reveneus, and who have admitted their error, whether they have returned the funds or goods they took in violation of discipline, and whether measures have been proposed so that henceforth there will be no further violation of financial and economic discipline.

4. In serious cases of violation of financial and economic discipline in which the case related to party or government disciplinary action and the taking of responsibility for a crime, whether solemn disposition has been made, or whether units

concerned have accepted and heard the case placing the case on file for investigation or prosecution, or are in process of handling it.

5. Whether plans have been made for increased output at a saving, and for increased earnings with decreased expenditures, and whether these plans have been carried out.

6. Whether needed rules and regulations have been established and perfected, as for example for collection and expenditure of public funds, fiscal management, economic accounting, issurance of awards and allowances, and pay advances for staff and workers.

ECONOMIC RESPONSIBILITY SYSTEM IN SCIENTIFIC RESEARCH UNITS

Guangzhou GUANGZHOU RIBAO in Chinese 27 Oct 81 p 2

[Article by Correspondent Ye Lifei [0673 7787 5481]: "Can Economic Work Contracting Be Instituted in Scientific Research Units?"]

[Text] Once economic contracting of work had been instituted in industrial enterprises, the promotion of production was effectively promoted. So, is it possible to institute economic contracting of work in scientific research units? This is an important question in scientific research management work. Some institutes have already begun to experiment with methods of a system of economic responsibility on problems, i.e. placing scientific research quotas on units tasked with problems in an economic contracting involving research expenses and the economic benefits of results. This is a new effort that merits serious attention and study.

The economic system of responsibility for research problems being tried by some of Guangzhou's research units is of three major kinds. One is a contract system of responsibility. The Guangzhou Light Industries Research Institute permits researchers to select research topics within the institute's research orientation, and following checking, approval and agreement, the unit tasked with the problem and the management of the institute sign a responsibility contract setting forth research tasks, technical norms, and dates of completion. Following completion, a certain proportion of reward funds are provided research personnel, the amount depending on the economic benefits derived from the results. Second, they have instituted a "four fixeds and one reward" coordinated process. For its key research projects, the Guangzhou Pharmaceutical Industry Research Institute has instituted fixed norms, fixed requirements, fixed time, and fixed personnel, integrating on the basis of project needs, a series of personnel responsible for research, testing, equipment, information, logistics, clinical applications, and management for a coordinated attack, responsibility for expenses being contracted, responsibility placed on the key task teams concerned. Following completion of tasks, award funds are taken from earnings from goods developed to be given to participants. Third is institution of research task accounting. The Guangzhou Radio Institute made the unit tasked with research responsible for all special equipment, raw and processed materials consumption and research expenditures allocated for each research task. All units completing their norms on time and having a surplus of contracted expense funds remaining could have 10 percent of the funds saved as a reward. Those who did not complete norms on time, even though they might have funds remaining, had their reward proportionately reduced.

Will these methods of economic contracting that are being tried work? Practice shows results have been very good. Last year after the Light Industries Institute tried out the contract system, the research personnel became extremely energetic, taking the initiative in proposing research topics and carrying out examination and research. They very quickly selected more than 30 projects to serve Guangzhou's light industrial production. After the institute selected 14 of these, everyone threw themselves into research with full vigor. The pace of research was quickened, and a new situation in which everyone competed to make contributions emerged. In recent years the Municipal Pharmaceutical Industry research laboratory required a relative short period of time to develop results with dinggongtengjian II [0002 0361 5671 4354 II] and naomaining [5207 9115 1380], which met advanced national standards. All were achieved through the method of "four fixeds and one reward." After the Radio Institute instituted research problem economic accounting, the research situation rapidly changed from a long period of stagnation to the complete satisfaction of norms and rapid production of results. Last year the institute completed 10 research projects and 5 developmental projects.

Heretofore quite a few people have felt that "production is a hard assignment but research is a soft assignment." Consequently some people did not bother about expenditures or economic benefits in doing research. Institution of a system of economic responsibility is an effective way to change this state of affairs. It links the results of scientific and technical work with the material benefits of scientists and technicians, strengthens the sense of responsibility of scientists and technicians, and arouses their initiative so that "soft assignments" become hard assignments with responsibilities and direction, which everyone strives to complete. Most of Guangzhou's institutes are conducting research in applied techniques, the results of which are directly related to economic benefits and for which use of economic methods is desirable.

Naturally, in instituting systems of economic responsibility, scientific research units should give attention to the individual characteristics of each institute and not entirely use the methods of plant enterprises. Each research unit can adopt diverse methods on the basis of actual circumstances. The basic principles are: Both attention to use of economic methods and attention to the guidance of research work on the basis of scientific laws with no "arbitrary uniformity." There are some nationally needed research projects of long range significance that should be given encouragement even though present economic benefits from them are slight, and the economic welfare of scientific research personnel working on them should be properly looked after. Some research projects on which the researchers responsible have exerted their best efforts have not been completed on time for objective reasons, and such cases should be handled with discretion and flexibility. In short, the method whereby research units institute economic systems of responsibility is a new effort in which numerous problems await continued exploration thorugh practice and the accumulation of experiences.

NPC DEPUTY URGES PLUGGING FINANCIAL LOOPHOLES

OW131221 Beijing XINHUA Domestic Service in Chinese 1803 GMT 12 Dec 81

[Text] Beijing, 12 Dec (XINHUA)--While examining Premier Zhao Ziyang's report on the work of the government, Deputy Wang Daren, who is attending the fourth session of the Fifth NPC, suggested that five loopholes must be plugged in finance.

The five loopholes he referred to are:

--Ill-conceived plans and lack of strict control have resulted in a number of "half-finished" projects and long delays in putting them into production. This kind of waste is the greatest.

--Overstocking products adversely affects revenue. Some enterprises are producing blindly, concentrating on output value alone. As a result, products fail to meet needs or are of poor quality and high price and cannot be sold. Nearly 1 billion yuan worth of goods are piled up in warehouses in industrial, commercial and supply departments in Jilin Province. This is more than 5 percent of the total output value of the national economy of the whole province.

--Losses are another big loophole. If the present annual losses of the whole country can be cut in half, it will be a very great help toward reducing this year's financial deficit. Losses of a policy nature are unavoidable, but some losses are problems of work, caused by the idea of eating out of the same big pot.

--Some financial subsidies are not exactly reasonable. Jilin Province pays more than 600 million yuan of subsidies each year, nearly half of the province's total revenue. This averages about 27 yuan for each person in the province each year (about 56 yuan for each person if only the urban population is considered). For a long time subsidies have accounted for more than 20 percent of our country's expenditures, and this is too large a proportion.

--The excessive distribution of bonuses also seriously affects the country's finances. Jilin Province issues about 250 million yuan of bonuses each year. approximately equivalent to 20 percent of the wages of woerkers and staff members in the whole province. Some bonuses are not earned by improving management and increasing output; they are obtained by certain inappropriate means. Moreover, due to the practice of equalitarianism, some bonuses have failed to produce the effect of arousing socialist enthusiasm among workers and staff members.

Deputy Wang Daren said: Effective measures should be adopted to plug financial loopholes. This is a way to accumulate wealth that must not be ignored.

FINANCE AND BANKING

ANHUI'S ZHANG JINGFU URGES ECONOMIC DISCIPLINE

OW110035 Beijing XINHUA Domestic Service in Chinese 0255 GMT 9 Dec 81

[Text] Hefei, 9 Dec (XINHUA)--Vice Governor of Anhui Province Meng Jiaqin said at a provincial meeting recently that since the inspection of financial and economic discipline conducted earlier, cases of indiscriminate issuing of bonuses and goods, extravagance and waste, extravagant eating and drinking, the buying of small motor cars without authorization, the building of courtyards for private use and arbitrary apportioning of funds have been reduced in various localities throughout the province.

Provincial revenue has increased monthly since the inspection of financial and economic discipline was launched in July of this year. October has become a record, peak month in revenue receipts in the province topping September by 25.29 million yuan. At present, 70 percent of the total amount of tax evasion and delinquent tax discovered during the inspection of financial and economic discipline has been recovered and delivered to the state treasury.

The Anhui Provincial CCP Committee and the Anhui Provincial People's Government have attached great importance to the inspection of financial and economic discipline. In late August, the province organized 100 cadres into financial-economic discipline inspection groups to work in 16 prefectures, municipalities, and counties and units directly under the province. On 5 October, after hearing reports on the progress of inspection in various localities, First Secretary Zhang Jingfu and Second Secretary Gu Zhuoxin of the Provincial CCP Committee and Governor Zhou Zijian called on various localities to further mobilize the masses to carry out this work as an important step in rectifying the party's work style and improving the mood of society.

Some of the problems discovered in the course of the inspection have been solved by clearing up facts and adhering to the party's policies and the state law. With regard to typical cases of a more serious and obnoxious nature, most of them have been dealt with according to law, thereby making the violators of financial and economic discipline pay their debts so that they cannot gain an extra advantage by unfair means. In conducting inspection in various localities, the inspection groups have also established and consolidated financial and economic disciplines, rotated the training of financial and accounting personnel and plugged all kinds of loopholes.

BRIEFS

CALL FOR PROTECTING RESOURCES--Nanjing, 13 Dec (XINHUA)--Chinese geologists, at a recent meeting of the Geological Society of China in Wuxi, Jiangsu Province, have called for a committee to protect the country's mineral resources. The gathering said China's 134 mineral deposits made it one of the world's five richest resource countries. Most of the deposits contain more than two kinds of minerals. However, the meeting warned, many mines exploit only the major mineral and waste the rest. Backward technology and administrative inefficiency cause the loss rate of ore to exceed acceptable limits. Commune-administered mines still excavate with little planning. The meeting called for establishment of a committee to survey, verify, plan the exploitation and use of mineral resources and oversee and encourage development of mining technology, dressing and metallurgy. The geologists also suggested to formulate a law governing mineral resources. [Text] [OW131303 Beijing XINHUA in English 1219 GMT 13 Dec 81]

GANSU ELECTROLYTIC NICKEL PRODUCTION--Lanzhou, 11 Dec (XINHUA)--Jinchang, China's leading nickel producer, in Gansu Province, met its annual electrolytic nickel production target 70 days ahead of schedule, the Jinchuan Nonferrous Metals Company announced today. Annual output quotas were also met ahead of time for electrolytic copper, platinum, palladium, gold and silver, the company said. The nickel recovery rate is 2 percent higher this year than last, and the recovery rate of platinum, palladium and other precious metals also has increased, the company said. Jinchang has the second biggest deposits of nickelous sulfide in the world after Canada. The city also has mining, smelting, power and construction industries and facilities for industrial and mining research. Jinchang also produces 20 other metals, including gold, silver, platinum, copper, cobalt, palladium, iridium, ruthenium and rhodium. [OW120625 Beijing XINHUA in English 0740 GMT 11 Dec 81]

INDUSTRY

OFFICIAL REPORTS ON SUPERVISION, INSPECTION OF PRODUCT QUALITY

Beijing BIAOZHUNHUA TONGXUN [STANDARDIZATION JOURNAL] in Chinese No 5, Oct 81
pp 2-6

[Excerpts from a speech by Yang Jizhi [2799 3444 0037], deputy director general of the Bureau of Standardization and concurrently director of the Bureau of Quality Supervision, to a State Bureau of Standardization Meeting in Yantai on 16 June 1980, on the work of product quality supervision and inspection in medium and small cities]

[Text] Report by our correspondent: From 13 to 16 June, the State Bureau of Standardization held a meeting at Yantai for the exchange of experiences in the work of product quality supervision and inspection in small and medium-size cities. At the conclusion of the meeting, Yang Jizhi, deputy director general of the State Bureau of Standardization and concurrently director of the Bureau of Quality Supervision, made a summary speech.

I. Continue To Implement the Spirit of the Wuhan Conference

In April of last year, a conference was held in Wuhan with the State Council's approval on the work of nationwide product quality supervision and inspection. In the conference, the policy and task of product quality supervision and inspection were clearly defined. At the same time, it was proposed that a fairly complete, authoritative and efficient network of supervision and inspection be set up throughout the country within the next few years so that the exercise of supervision and inspection could be gradually extended to key products, products which might affect people's safety and health, products bearing a "superior" stamp, and certain import-export commodities.

After that conference, the standardization bureaus in various localities have implemented conscientiously the policy of "blazing a trail through diligence and frugality, consolidating the foundation, and carrying out overall planning and active development" adopted at the conference. Despite the shortage of manpower, equipment and funds, these bureaus have overcome various difficulties and achieved great success in creating the necessary conditions and in actively developing the work. According to incomplete statistics, by the end of May, 666 inspection stations had been set up throughout the country, while 63 product quality inspection institutes were reactivated, improved or established, and more than 50 inspection-test centers were established in 7 ministries, thus laying a preliminary foundation for the inspection network.

Though still in the process of formation and far from perfection, the present inspection organs have nevertheless done a great deal of work in exercising supervision and inspection in certain key products; in carrying out inspection on other people's behalf; in the evaluation, selection and further checkup on fine quality goods; in arbitrating quality disputes; in determining the grade of new products; in inspecting exported commodities and demanding compensations; in helping enterprises set up standards and promoting all-round quality control; and in the transmission and feedback of information on quality and in technical training. They have also played an active role in enforcing technical standards and improving the quality of products.

In the past 2 years, we have also done a great deal of work in quality control, resulting in the improvement of product quality. Speaking of the quality of our industrial products as a whole, however, many products are not yet up to the required technical standard, and the "quality first" idea has not taken firm roots among many enterprises. Whenever there is a clash between quantity and quality in production, quantity always has the upper hand with the result that even substandard products have found their way into the market and caused losses to the state and the people. This shows the urgent need for state supervision and inspection of product quality.

Some leading comrade of the State Council recently said: "There are now some products on the market of inferior quality but with high prices. Some people said that goods of even poor quality can be sold, and at negotiated prices too, simply because of the scarcity of goods on the market. This is victimization of the people." "Some solution should be quickly worked our particularly as to the problem of the standard of quality. We cannot afford to sell substandard goods." He also pointed out strongly: "The question of quality is a political one, or a question of whether or not we are responsible to the people. It also affects the cardinal issue of the worker-peasant alliance and the urban-rural relationship. Quality improvement is no easy matter, because it calls for scientific research, design, fine material quality, management and technology. If we cannot bring the products up to the required standard, it would be better for us to produce less. We must never produce anything in a rough and slipshod way." "Good quality is necessary not only for exported goods, but also for those used at home. We must not produce anything in a sloppy way, and anything that may cause inconvenience to people must not be allowed to leave the factory. Strict control is necessary." These remarks pointed to the importance of quality control and clearly showed the origentation of our work.

The foundation of our supervision and inspection on product quality is still very weak; and the supervision and inspection apparatus is not only imperfect, but also practically nonexistent. Because of the stress on quantity at the expense of quality and the greater attention paid to the production equipment than to the means of inspection and testing, the enterprises are incapable of examining and testing, their own products. Some of their examination instruments are fairly outdated, and even these instruments are hopelessly insufficient. Some enterprises are using instruments and equipment left over from the 1930's, while others without even their instruments and equipment are relying only on their experiences. These conditions are incompatible with the development of domestic and foreign trades and the requirements for competition on the market. It is therefore necessary for us to strengthen our constant supervision and inspection. The setting up and perfrecting of a supervision and and inspection network for product quality is now an objective necessity, and this necessity is particularly urgent for the small and medium-size cities.

If an inspection network can be formed to cover approximately 200 small and medium-size cities and to exercise the work of supervision and inspection, the quality of our products can be greatly improved. I hope that through the present exchange of experiences, this network can be set up at an early date.

II. The Question of Organizing an Inspection Network

Product quality supervision and inspection means the exercise of supervision and inspection by the government on the quality of the enterprises' products on the basis of technical standards, and, if necessary, the prerogative of the government to determine whether an enterprise is in a condition to produce up-to-standard goods (or fine-quality goods). By this means, the enterprise will be encouraged to raise its technical and management standards and to produce goods of high quality. In view of the huge quantities and numerous varieties of goods, the task of supervision and inspection can hardly be acoomplished without an organized supervision and inspection network.

How will the supervision and inspection network be organized? Based on our recent experiences, the following basic principles are generally applicable:

1. The organization of a supervision and inspection network must be suitable for local conditions and based on realities.

The organization of such a network should proceed from our national conditions and the present realities in our national economy, and help foster the spirit of pioneering through diligence and frugality. According to the guiding thought proposed at the Wuhan Conference for organizing this network, we should first organize the existing inspection forces and bring them into full play. On this basis, the provinces and municipalities having the required resources can gradually set up and strengthen their inspection institutes which should be distributed evenly throughout the areas. In organizing the network, the following points should be noted.

a. First, careful investigations and study should be conducted to ascertain the existing conditions, and plans for the organization should be worked out accordingly. After more than 30 years' experience, we should have a sure foundation in construction, and many scientific research units, universities, professional training colleges and trades have set up their examination and testing centers. Most large and medium-size enterprises are also in possession of a certain amount of examination and testing instruments and equipment. After mutual consultation, they can all be organized to set up inspection stations to undertake certain supervision in inspection jobs on behalf of other people. The localities can decide on the number and the specialization of stations to be set up according to the local industrial structure and then plan for the organization of a network. One inspection station can be set up for many enterprises producing the same products. For those enterprises producing a single product of a highly specialized nature, some other forms of supervision can be adopted in lieu of a specialized station.

b. Inspection stations form an important component of the inspection network, and should not be regarded as some temporary or transient form. Therefore, the quality of these stations should deserve great attention. In selecting the sites for station building, the following conditions should be considered: a fairly strong inspection force; the required instruments and equipment; a system of rules and regulations; the qualifications for fulfilling the task of supervision and inspection on behalf of others in a fair way; the enthusiasm of unit leadership in undertaking the task; and so forth.

There are now three prospective locations for the building of stations: first, the laboratories of scientific research units; second, the examination and testing centers of different trades under various departments (such as stations for routine electronic experiments); and third, the production enterprises with fairly good facilities for examination and testing. In view of their capacity as unbiased observers, it would be preferable to set up inspection stations at the first two types of locations, and all units in a position to do so should act accordingly. If inspection stations are set up in production enterprises, which are themselves subject to supervision and evaluation, their judgement as unbiased observers may be questionable. We should, therefore, make full use of all available equipment and data, and select people from various units to act as supervisors and inspectors. It is also advisable for people to be assigned by higher authorities.

c. All prefectures and municipalities can set up inspection institutes provided the required facilities are available. From a long-range view, we can see that if a city with concentrated industrial activities wants to do well in the supervision and inspection of product quality, it must have its own inspection institute in order to be efficient. In setting up inspection institutes, we should not form any "large and all-inclusive" or "small and all-inclusive" units, and every effort should be made to avoid any duplication of equipment or functions. The building of inspection institutes should be based on reality, kept within the limits of feasibility, and carried out in a planned, systematic and selective way. We must guard against "acting rashly on the spur of the moment." In setting up inspection institutes, we must bear in mind that these institutes will have to perform major functions, serve many trades, and undertake inspection jobs of long cycles, or such jobs as are beyond the capability of inspection stations. A great deal of organization and coordination should be carried out within the inspection network.

d. In organizing and building inspection stations, we should pay attention to their consolidation. Inspection stations generally undertake the task of scientific research and production. Now that they have to undertake inspection as an additional task, some real problems or difficulties may crop up in the course of this work. These problems and difficulties should be promptly tackled, or they may dampen the enthusiasm of the workers and impair the consolidation of these stations. How should they be consolidated? First, leadership and ideological-political work should be stepped up. We should pay constant attention to their work, help them solve problems, and instill a sense of responsibility among the inspection personnel. Second, the tasks to be undertaken by each inspection station should be fairly clearly defined, and a suitable system of management should be set up, so that all inspections can be conducted in a systematic and planned way. Third, attention should be paid to the economic benefits of the inspection stations.

e. Professionally, the municipal inspection stations should be under the leadership of the municipal inspection institute or a corresponding section of a provincial inspection station. There should be suitable vocational relations between the stations and the institutes.

2. A Strong Contingent Is Needed

The principle behind the work of quality supervision and inspection is to "control, help, and promote." While stressing the need for good quality, it is also necessary to provide the enterprises with technical assistance in order to promote improvement. Besides being familiar with the technology of production and the required standards and being able to operate the equipment and instruments, the inspection personnel should also be good at uncovering problems and introducing new ideas for improvement. Therefore, a high level of vocational or technical skill and a keen sense of responsibility are necessary. In building up a strong [inspection] contingent, the following points, based on our common experiences, should be noted:

a. In the selection of personnel, attention should be paid to their qualifications. Because of the numerous varieties of products requiring supervision and inspection and involving many professional and technical branches, in addition to the large volume of work and the shortage of personnel, it would be difficult to proceed with work if the question of personnel qualification does not receive due attention. Therefore, we must be sure that the vast majority of the assigned personnel are of a high technical standard and have good experiences.

b. Attention should be paid to regular training. Inspection personnel should have a diversified knowledge. If we want them to be both specialized and versatile, we must pay attention to their regular training. This is all the more necessary for those comrades with a comparatively weak training foundation.

c. In addition to a professional inspection contingent, we should also invite some workers in plants or scientific research units to participate in the inspection work on a part-time basis as a remedy for the shortage of personnel. It is also advisable to invite highly qualified engineers and technicians to participate in difficult tasks whenever such occasions arise. These engineers and technicians can also undertake the work of technical consultation.

3. A System of Rules and Regulations Is Necessary

First, we must see to it that the local government publicizes the methods of control over the supervision and inspection of product quality under its own jurisdiction; stipulates the tasks and responsibility of the organs of supervision and inspection; and clearly defines the position occupied by these organs, the scope of their authorities, their relations with the relevant departments, the forms of supervision to be exercised, and the procedures for the disposal of substandard products. These measures will enable the inspection network and the relevant departments and enterprises to have some rules and regulations to go by, and will insure the smooth progress of the work of supervision and inspection.

To insure their own normal operation, the inspection organs should set up a system of job responsibility; a system of repairs and maintenance of their instruments and equipment; and the systems of periodical calibration, sampling and testing, vocational conferences, inspection reports, regular vocational training, and so forth.

4. Reasonable Inspection Fees Have To Be Charged

The present charges mainly take two forms: First, the charges are based on the consumption of labor and materials including water, electricity and others; the depreciation of equipment; and a certain amount of operating expenses. The second method is to take a certain portion of the sales value of the products inspected as inspection fees. Since conditions are different in various localities and we have not yet had much practical experience, the following principles are offered for consideration:

a. The fees should be reasonable and not too high. Fees for inspection in the function of supervision should be lower than those charged for inspections undertaken on another's behalf. Generally, it should be reasonable to charge according to the consumption of water, electricity and other materials; the expenditure of labor and the depreciation of fixed assets.

b. Fees must not be duplicated. If one type of product has to be inspected by several parties, arrangements should be made with the authorities concerned for a joint inspection to be considered.

c. The fees collected by an inspection organ should be used mainly to meet their own expenditures.

III. Several Questions To Be Noted in Proceeding with the Work of Supervision and Inspection

1. To Be Good at Organization and Coordination

At the Wuhan Conference, it was pointed out that our departments in charge of standardization should undertake the work of organization and coordination. "First, organization means the rational organization of our existing inspecting strength for full utilization. Second, coordination means streamlining the relations between the central and the local governments for the purpose of a rational division of work and coordinated efforts and avoiding duplication. Third, service means assistance in solving problems in the course of inspection work." Organization and coordination with other professional inspection organs involving such questions as whether the mass line has to be implemented, and whether all positive factors have to be mobiliized in forming the network. We must coordinate the efforts of all forces in various quarters and give full play to their various functions before our supervision and inspection of product quality can effectively insure fine quality.

In addition to the inspection organs of the standardization departments, supervision and inspection of product quality are now being carried out by the professional inspection organs of other concerned departments, and the product inspection centers formed in various branches. Despite their different affiliations, the work of all these inspection organs is similar. In other words, all these inspection organs are components of the same inspection network, and their functions are naturally closely related. Thus, problems in coordination will unavoidably arise in certain specific jobs. For example, there may be either duplications or omissions. Therefore, we must step up our efforts in organization and coordination, and even without any change in the affiliations and division of work, there should be mutual respect, mutual support and good coordination among different organs in order that duplication of work can be avoided. In this connection, we should all continue our practice and sum up our experiences in order to blaze new trails.

2. Active Coordination With the Central Task

Our work is only part of the overall task of economic management, and must therefore be coordinated with the central task in order that we may make greater contributions to our economic development. To coordinate with the central task, the following points should be carefully noted:

First, we must assist in the appraisal and choice of products for the national quality awards and other fine quality ratings. Rewards for fine-quality products are in line with the important state policy for the control of production quality. Every year, the state holds a "quality month" campaign during which state quality prizes are awarded and the evaluation and choice of fine-quality goods are carried out at provincial levels. We must participate actively in these activities under the unified leadership of the economic commissions at various levels.

Second, it is necessary to assist enterprises in promoting total quality control. Total quality control is a scientific method of quality control in modern industrial production as well as the central link of enterprise management. In carrying out total quality control, we should adhere to the principle of "prevention first," and exercise quality control throughout the process of design, trial production, regular production and postsale services. All workers and staff members should participate in this work of production and inspection by strictly complying with the technical standards and by combining self-inspection with mutual inspection in an all-out effort to eliminate substandard goods in the course of production. This is the basic way to guarantee the fine quality of products. Efficient total quality control by the enterprises is the foundation of state supervision and inspection, and shares a common goal with quality supervision and inspection. Therefore, we should assist the enterprises in setting up and perfecting a system of total quality control and then encourage the enterprises to keep up their efforts in this direction, in order to raise the quality of the products to a new level.

Third, assistance is required in the transmission and feedback of information on quality. Through their evaluation of the quality of the enterprises' products, the supervision and inspection organs are in a position to possess and accumulate a huge amount of numerical data. They should report at regular intervals to the planning and economic commissions, the bureaus in charge, and the production enterprises on the situation of product quality, and offer their views and proposals on the ways and means to improve quality control and to deal with incidents resulting from the use of inferior products.

There must be a strict control of product quality so that no substandard products will be accounted for in the fulfillment production plans or in the computation of input values; and no substandard products can be sold at the same price as up-to-standards goods. Furthermore, we have to help and to promote, that is, to help the enterprises analyze the problems of quality discovered, study the methods of solving these problems and improving the quality, and promote the continual improvement of their product quality. This is also a basic measure of protecting the economic interests of the broad masses. In actual work, we should on the one hand examine the quality of the enterprises' products so as to be sure that they are of fine quality; and, on the other hand, we should dispose of the substandard products which are already on the market by directing the enterprises to set up a system of repairing, replacing and recovering these products within a specified period. This is an important work in protecting the economic interest of the broad masses, and this work must be carried out in earnest.

All these views are offered for the comrades' reference. As to the way to set up the network, let me quote for a leading comrade of the State Council as follows: "Conditions in our country are too complex and it is impossible to use a single formula for the solution of all problems. We must adapt measures to the local conditions, conduct more discussions and then seek truth from facts." We should learn from the experiences of other regions in the light of our own realities, and carry out our work by adapting measures to local conditions.

RESTRUCTURING MANAGEMENT OF TEXTILE ENTERPRISES DISCUSSED

Kunming JINGJI WENTI TANSUO [INQUIRY INTO ECONOMIC PROBLEMS] in Chinese No 5, 1981 pp 54-57

[Article by Zhang Quan [1728 2938]: "A Preliminary Discussion of Experiments in the Restructuring of Economic Management System in Textile Enterprises"]

[Text] Guided by the "eight-character" policy, 11 textile enterprises experimenting in the expansion of decisionmaking power in Yunnan Province had a total output value of 294 million yuan in 1980, an increase of 16.2 percent over 1979, and a total profit of 41.95 million yuan, an increase of 42.94 percent over 1979. In 1980, they handed over to the state 25.44 million yuan in profits, an increase of 11 percent; their industrial and commercial tax paid amounted to 28.76 million yuan, an increase of 14.8 percent; they retained 10.06 million yuan, an increase of 87 percent over 1979. With their profits, they also redeemed 2.76 million yuan of various loans. Such a rapid growth was unprecedented in the textile trade of Yunnan. Other enterprises not yet given expanded power for decisionmaking, but sharing profits or being responsible for limiting loss to a certain extent, also achieved fairly good economic results.

Several Methods of Experiment

The textile enterprises of Yunnan have tried out several methods in restructuring their economic management system.

1. Profit sharing. Six enterprises tried out this method. Profit sharing was classified into "sharing total profits," "sharing above-quota profits," and "sharing base profit with an extra share for above-quota profit," with different ratios of sharing. As shown by the economic results in 1980, three of these 11 enterprises with expanded decisionmaking power adopted the method of profit-sharing and had the highest profit rates. Among these three enterprises, the first one retained 40 percent of the profit, and its profit increase rate was 120 percent. The second one retained 30 percent of the base profit with an addition of 50 percent of the above-quota profit, and its profit increase rate was 128.9 percent. The third one retained 20 percent of the profit with an addition of 40 percent of the above-quota profit, and had a profit increase rate of 85 percent. However, another three enterprises with the lowest profit increase rates also adopted the method of profit-sharing. The first one, which retained 30 percent of the profit, had a profit increase rate of 14 percent; the second one, retaining 24 percent of the profit, had a profit increase of 5.67 percent; and the third one, retaining 6.6

percent of the profit with an addition of 15 percent of the above-quota profit, had a profit increase rate of 8 percent. From this, it is not difficult to find out that among the enterprises with expanded decisionmaking power, those having a larger share of the profit also have a higher rate of profit increase, and those having a smaller share of the profit have a lower rate of profit increase. Profit increase can certainly be attributed to many factors, but a correct proportion of sharing and a rational distribution among the three parties are certainly the important ones. If the ratio of sharing is inappropriate, there will be the spectacle of "penalizing the advanced units," because those who have contributed more cannot be duly rewarded, and this will naturally dampen the enthusiasm of the workers.

2. Independent accounting, paying state tax, and assuming responsibility for profits and losses. Three factories tried out this method. At first, the taxes paid by them were 34.38 percent, 40.82 percent and 48.8 percent respectively. This method was warmly welcomed by the enterprises, because a certain portion of the total profits can be used to solve some urgent problems in production and improvement of the workers' livelihood, which was already overdue. The economic results were good during the experiment in the fourth quarter of 1980, but generally this method was suitable only for enterprises with a fairly good profit foundation for the following reasons: 1) In using this method, wages, fringe benefits, and bonuses are linked up with profits. Those enterprises not so sure of profits are unwilling to take any risk by assuming responsibility for profits and losses. 2) This method calls for complicated calculations, and the enterprises concerned have to spend a lot of energy in working out the portions to be retained and to be paid. There have been protracted bargaining and negotiations for the ratio of state tax to be determined. Since the beginning of this year, income taxes have been levied at a uniform rate of 50 percent with the addition of a regulating tax. The computation of regulating tax is even more complicated, and after repeated trials, one of the plants had to pay 1 percent for regulating tax, while another paid only 0.2 percent. The former had to pay 5 times that of the latter. 3) Provided the system and methods of wage payment remain unchanged, the basic wages are to be appropriated out of the retained profits. At present, this does not seem to make much difference because even though an enterprise retains more profits, there is no corresponding adjustment of wages for the workers and staff members. Their wages are not much affected by the profits.

3. Merits of Responsibility for Profits

Compared with the various other methods, responsibility for profits has the following merits:

1. It is suitable for enterprises with or without expanded decisionmaking power; for prefectures, municipalities, departments and companies as well as units, workshops, work teams, and even individuals in all trades and undertakings. It can also be used in the control of material consumption and administrative expenses.

2. This method of calculation is fairly simple. Instances of wrangling on this score have been very rare.

3. When the amount of profit to be handed over has been determined, and the enterprise has a clear goal for its efforts, economic management and the sense of

responsibility will be strengthened in every link and at every post of production, and great efforts will be made to increase production and practice economy, to increase income and curtail expenses, and to reduce the consumption of energy and raw materials. All these efforts will result in great economic benefits.

4. Based on the profits to be made and the need for production development, the enterprise can work out active and yet steady and reliable long-range plans. The Kunhu Knitted Goods Mill is now proceeding to build 10 branch mills which will be of great help in the readjustment of the industrial structure and the development of the textile and knitted goods trade.

5. While the state can increase its revenue in a steady and sustained way and thus greatly reduce its financial burden in the form of financial allocations for enterprises, the enterprises can also use their own funds in a planned and timely way to develop their production and improve the conditions of production and the welfare of the workers and staff members.

Merits of "Responsibility"

1. "Responsibility" and "eating out of the same pot" are mutually contradictory. Because of the effects of "leftist" ideology since the founding of the People's Republic, "responsibility" has been looked on as some sort of "capitalist ware" and repudiated as something "sinister." On the other hand, "eating out of the same pot" and "equalitarianism" were regarded as being in line with socialist economic principles. This has caused grave political, economic and ideological consequences. In order that production can develop normally, the practice of "eating out of the same pot" must be replaced by a system of "responsibility." Only thus can we bring more vitality to the enterprises and improve the economy.

2. "Responsibility" conforms to the principle of socialist material benefits through the integration of rights, responsibilities and interests. It also plays the role of incentives for the advanced while spurring on the backward ones through distribution of material benefits according to the enterprises' contributions to society. Handing over the profits means responsibility to the state, and keeping the excess profits means responsibility for the enterprises' development and responsibility to the workers and staff members. The increase in rights and responsibilities for the enterprises also means an increase in material benefits, and will serve to encourage every worker and staff member to be concerned with the economic results of their own enterprise operation.

Basis, Methods and Visisons of "Responsibility"

1. Rate of growth is an important basis for determining the rate of profits to be handed over to the state. The rate of growth in the textile industry as demanded by the Ministry of Textile Industry is a progressive increase of 8 percent every year, so that at this rate, the profits to be handed over to the state will be at least doubled in 10 years. For the Kunhu Knitted Goods Mill, the progressive rate of increase was fixed at 10 percent every year so that the profits would be doubled in 7 years. For the whole textile trade, an annual progressive increase rate of 8 percent would be more appropriate. Such a growth rate is not low, and it can be accomplished with some effort.

2. The experiment of expanded decisionmaking power by the Kunhu Knitted Goods Mill began in 1979, when 10.4 percent of the total profits were retained. In that year, the profits handed over amounted to 2.5 million yuan. In 1980, the system of responsibility for profit quota was adopted, and the amount of profits handed over in the preceding year was used as the profit base. With a 10 percent addition, the amount of profits to be handed over was 2.8 million yuan. After a deduction of 0.24 million yuan for the redemption of loans, the actual profits to be handed over were 2.56 million yuan, representing an actual profit increase rate of 2.4 percent. In 1981, the amount handed over in 1980, namely, 2.56 million yuan with a progressive increase of 10 percent, was used as the profit base. The amount of profit to be handed over in 1981 is 2.82 million yuan. Any excess over this amount will be retained by the enterprise to be used as production development fund, welfare fund and bonus fund. In 1980, the Kunhu Knitted Goods Mill's retained profits amounted to 2.39 million yuan. Out of this sum, 600,000 yuan was used to buy national bonds; 1.4 million yuan to buy four warp knitting machines and one beam warping machine from abroad; and the remaining 390,000 yuan for bonus and welfare funds. The investment of 1.4 million yuan in 1 year to upgrade equipment was unprecedented. Were it not for the system of responsibility for profits, it would have been impossible for an enterprise to spend so much money on the expansion of its productive capacity.

3. How will the base of profit to be handed over be determined after 3 years? This is a matter of great concern to many enterprises, and each case must be handled on its own merits. For enterprises with fairly steady production, the rate of profit increase can continue to rise on the basis of the original "responsibility." In other words, the amount of profits handed over in the third year can be used as the base, and the same procedure can be followed in future, provided the progressive rate of increase is properly adjusted from time to time according to changing conditions. If the amount of profits handed over in the third year is to be used as the profit base for some enterprises with fast developing production and making great profits, then the profits retained may be more than those handed over to the state. For the same reason, if the total profit of the third year is to be used as the profit base, the enterprise may not have much to retain. As the principle behind the solution of this problem, the state's income should increase along with the increase in the enterprise's profits, and the enterprise should also retain more in order that its activism in production will not be dampened.

4. Companies should also adopt the system of "responsibility for profits." The existing management system is not helpful to the companies in playing their roles of overall arrangement, business service, supervision and coordination. There are many problems in readjustment and restructuring that are difficult to solve. The system of responsibility for profits will help in strengthening the companies' overall leadership over the business management of the enterprises; in coordinating and evening up the supply of raw materials and readjusting the prices of products among the enterprises; in readjusting the product mix, and improving and promoting the regulative role of the market under the guidance of state planning; in solving the problem of uneven distribution of benefits and responsibilities among different enterprises and the problem of bonuses; in promoting training for and scientific-technical exchange among the workers and staff members; and in using the accumulated funds for tapping potential, renovation and transformation of equipment on small and medium scales, and developing the textile industry in a

planned and systematic way. In short, it will strengthen the companies' rights and responsibilties so that rights, responsibilities and interests will be integrated to promote the implementation of the "eight-character" policy as a contribution to the four modernizations.

Several Views on Restructuring

The period of experimenting in the various methods of restructuring the management system of textile enterprises is still brief, and no mature experience can be obtained. Yet one point is certain: They are the methods for correctly handling the interests of all three parties. Now I would like to present some views for discussion.

1. The state's share should be larger than the enterprise's. To guarantee a steady and sustained increase in state revenue is the principle which must be observed by every person working in government organs and every person responsible for the management of enterprises. Should there be any sharp rise in enterprise profits because of unforeseen circumstances (in which case, the portion retained by the enterprise will be more than the portion received by the state), consultations should be conducted with the enterprise concerned so that the state's share can be enlarged. However, instead of arbitrarily changing the original ratio and base figure, it is necessary to provide guidance and exercise proper control in the use of funds and the payment of bonuses by the enterprise.

2. For enterprises enjoying favorable production conditions and earning high profits, their retained share of profits should not be too small. Their retained portion should increase along with the increase in the state's portion so that these enterprises may have a goal to strive for. At the same time, we should note that the textile enterprises are generally using rundown buildings and outdated equipment, and have many long-standing problems to solve. Therefore, we should be liberal with their retained share.

3. Sharing the total profits provides no incentives to the fulfillment of the profit plan. If the ratio of the retained share is small, it may even dampen the enthusiasm of the enterprises in production and affect the state's steady income. It is proposed that hereafter, this method will be used sparingly or not at all. Last year's experiences proved that the enterprises retaining only small shares had rather poor economic results.

4. The principles in assuming responsibility for profits should be clarified. For example, the base profit and the progressive rate of increase should remain unchanged for 3 years instead of being changed at will. The enterprises are afraid of policy changes.

5. In assuming responsibility for profits, the enterprise should also gradually strive to link the profits with the completion of production plans, and the fulfillment of the quality, varieties, production costs and other technical and economic targets in order that there can be an all-out implementation of the system of economic responsibility.

6. The departments in charge should use the necessary administrative intervention and other effective means of control in the use of retained funds and the payment of bonuses by the enterprises.

INDUSTRY

MEASURES TO DEVELOP TEXTILE INDUSTRY EXAMINED

Tokyo CHUGOKU NO BOSHOKU KOGYO in Japanese 1981 pp 3-28

[Publication of the Japan-China Economic Association]

[Text] Chapter 1. China's Policy for Development of Its Textile Industry

I. Reevaluation of the Textile Industry

China's textile industry consists of 10 areas, including cotton textiles, wool textiles, linen textiles, synthetic fiber textiles, textile printing, knitted fabric, secondary products, spinning machinery, and spinning equipment. As of 1979, there was a total of 4,958 enterprises in the textile industry departments, and the total manpower involved was 3.1 million men. The total production for the same year accounted for 11.8 percent of the total industrial production of the country (Note 1). This ratio was not as high as the 37 percent during the initial days of the country's founding (Note 2), but there is no question that, even today, the textile industry is one of the important industries of this nation.

The administrative organ for the textile industry in China's central government is the Textile Industry Ministry. At one time between July 1970 and March 1978, the Textile Industry Ministry was incorporated into the Light Industry Ministry. This appeared as a so-called "Jingbing Jianzheng" ["better troops and simpler administration"] (simplifying mechanism) that was a manifestation of the Cultural Revolution, but the actual situation was the little regard for the textile industry. In March 1978 after the overthrow of the "gang of four," the direction and control of the textile industry on the part of the central government were strengthened, and the textile industry was separated and made independent of the Light Industry Ministry.

The administrative system over the textile industry was a comparatively centralized control system during the First Five-Year Plan (1953-57). On the other hand, as one phase of the modification of the entire industrial control system which started in 1958, the greater part of the industries which had till then come under the central textile industry departments' control was transferred to the localities (mainly at province level). This was the so-called "downward dispersion" of central industries to the regional levels. This dispersion of industrial control to the local districts as a whole did not continue very long, and after the collapse of the "Great Leap Forward," it became inevitable along about the first of the 1960's that a general readjustment of the country's economy be made, and there was a return once more to central control. On the other hand, the situation with respect to control over lower level enterprises was not too firmly handled, and most of the enterprises (plants) continued to remain under the control of various local governments, with the exception of major enterprises (plants) dealing with chemical fibers and textile machinery. In this manner, the textile industry departments have remained under decentralized local government control ever since 1958, and synthetic fiber integrated complexes and major plants making textile machinery are the only ones under the Textile Industry Ministry of the central government.

There are the following three types of local textile industry management systems (Note 3). 1) Urban textile industry bureaus directly under the central government--various specialized industrial corporations--enterprises (plants). This was the management system found in the three cities under direct control of the central government (administrative areas at the same level as the province) and was applied to Beijing, Tianjin and Shanghai. The lower specialized industrial corporations under each office were established according to the type of industry. For example, the Shanghai bureau has a breakdown into 11 corporations, such as cotton textiles, dyeing, predyed textiles, and knitted fabrics. At the present time, these special corporations do not comprise independent enterprise units but are intermediate between the bureau and enterprise (plant) and they are the organs which direct and coordinate the activities of various lines in the textile industry departments. 2) Province--country or urban textile industry bureau--enterprise (plant). Many of the provincial textile industry enterprises receive guidance in operations from the county or urban textile industry bureau to whose jurisdiction they belong. 3) Provincial textile industry bureau--enterprise (plant). This is the system in effect in some of the provinces such as Henan and Shaanxi. There were occasions during the cultural revolution when the enterprises were shifted to the counties or cities ("downward dispersion").

Now, as part of the economic readjustment initiated in 1979, there was a shift to emphasize development of all light industry, including the textile industry. This was, above all, a reaction to the overwhelming attention given the heavy industry till then with accompanying deemphasis on development of agriculture and light industry. There already had been a reaction to this overwhelming development of heavy industry during the "Great Leap Forward" (1958-1960) in the first half of the 1960 decade, and a proposal was made to reorganize economic planning in the order of agriculture, light industry and heavy industry, but this policy was not implemented as the country became more deeply involved in the cultural revolution. As the 1970 decade came, the priority of industries in the order of "heavy industry, agriculture, and light industry" was applied throughout the country, and it was a trying period for light industry (Note 4).

The development of all light industry, including the textile industry, was suppressed by the overwhelming preferential development of heavy industry. This can be seen, for example, in the amount of national capital construction investment allocated to light industry of 5.7 percent for the First Five-Year Plan (1953-57) during the middle of the 1950's, declining to 4.8 percent during the Fourth

Five-Year Plan (1971-75) in the first part of the 1970's (Note 5). Furthermore, there were insufficiencies in the supply of facilities, raw materials, and energy to all departments of light industry, and these shortages were sometimes considerable. The electric power allotted to industry was taken up by heavy industry to the extent of 80-90 percent, and industries such as metallurgy and chemicals used as much as one-third of the total power while the light industrial departments could use but about 10 percent (Note 6). In other words, the heavy industry departments of the country, including energy production, was undergoing the so-called self-serving type of development, and serving light industry and agriculture was downplayed, or even suppressed.

Because of the little regard for production and construction as well as suppression of all light industry departments, including the textile industry, there was an accompanying limitation to any expansion of the supply of daily-use industrial products so deeply tied with the people's livelihood. Even the data supplied by the Chinese shows that the per capita consumption of textiles is about 40 percent that of the world's average (Note 7). The average per capita consumption of cotton goods in 1969 was 17.1 chi (1 chi is one-third meter, the Chinese chi is equivalent to 1.1 Japanese shaku) which was the ration ("fabric ticket"), and there has been little increase over the past 10 years (Note 8).

With the proposal of the so-called "four modernizations" (modernization of industry, agriculture, national defense, and science and technology) as the pressing subjects of the country following the fall of the "gang of four" in the autumn of 1976, construction in the heavy chemical industry was reactivated. The adoption of the ambitious "10-Year Plan for National Economic Development" at the National People's Congress in the spring of 1978 spurred on this movement. On the other hand, it became clear as early as 1979 that this urgent and excessive construction of heavy chemical plants was causing severe imbalance in the national economy, and it was decided to undertake a 3-year period of economic readjustment at the National People's Congress in June of the same year.

It was recognized at that time that a revision of the priority order in the economic plan for agriculture, light industry, and heavy industry was, first of all, the most pressing issue for economic readjustment. The reaction had taken place to the former setup whereby agriculture and light industry were sacrificed for the one-sided and runaway development of heavy industry, and recognition developed that this practice was the prime factor responsible for this economic imbalance.

With the recognition of the so-called "agriculture, light industry, heavy industry" policy, the role of light industry, including the textile industry, in the nation's economic development began to be stressed once more. First of all, it was emphasized that light industry is an important source of national income. Let us look at some data released by China. During the 28 years from 1950 through 1977, enterprises in the light-industry departments, including the textile industry, contributed close to 30 percent (29 percent) of the national income (here and below, includes fiscal income of the central and local governments) in profits and taxes and 70 percent of the capital construction investment for the same period (Note 9). Looking only at the textile industry, it accounted for only one-tenth of the total profits and taxes during recent years (Note 10).

It is sometimes emphasized that there are good returns on investments in light industry in line with the important role assigned to it to accumulate capital. For example, the country diverted but 510 million yuan to the renewal of old plants located in China's largest textile base in the Shanghai area for the past 30 years (1950-79), while the profits and taxes returned by the industry to the country for the same period was 42.62 billion yuan, more than 83 times the sum invested (Note 11). At the same time, it was pointed out that "the history of industrialization of many of the leading countries started with the development of the textile industry" (Note 12), and an expansion of the textile industry also is associated with development of light industry to lead to the "light industry nourishing heavy industry" (hereafter abbreviated to light nourishes heavy) method (Note 13).

The second point stressed in the roles of the light industry and textile industry is the role they play in the improvement of the life of the people. The policies of the past which involved blind pursuit of rapid growth and high targets sacrificed the well-being of the people and stressed construction of heavy industrial facilities. The new people who came into power after the overthrow of the "gang of four" were imbued with the need to redeem the government from the "bill of sale" the people had been saddled with. Vitally needed rises in the prices of agricultural products and increased wages for staff members and workers were put into effect after what had been an interminally long period at no change. At the same time, the suppression of consumption, which had continued for a long time, was eased, and a demand was made that increased supply of various light-industrial products necessary to the people's livelihood be pursued. This move was also necessary to draw the people into whole-hearted participation in modernization.

The third point brought out in the roles of the light industry and textile industry was expansion of export products. According to a recent Chinese publication, about 45 percent of the income from export was attributable to the light industry and textile industry, which was considerably better than the 31.9 percent contributed by heavy industry (Note 14). It was said that the textile industry alone accounted for more than 20 percent (Note 15). Unlike a temporary closing of the gates, as long as modernization proceeds with the promotion of "economic policy for release to the outside" (Note 16), there may be much greater request for export than was experienced in the past. It is only natural that there are greater expectations for the role of light industry, particularly the textile industry.

At the People's Congress of June 1979 when this economic readjustment was formally hammered out, the second item on the list of 10 major tasks was to "take measures directed at developing light and textile industries." The first item was, needless to say, to strengthen agricultural development.

Management to speed up light and textile industry development materialized with the enactment of the "six priorities" in 1980 (Note 18). The "six priorities" involving the light and textile industries were 1) supply of raw materials, fuels, and electric power, 2) development of latent capacities, technological innovation, and improvement, 3) capital construction, 4) bank loans, 5) allocation of foreign exchange and introduction of technology, and 6) traffic and transport.

It was indicated in the economic readjustment which followed in 1981 that these "six priorities" with regard to the light and textile industries will be continued (Note 19).

II. Raw Material Problems of the Textile Industry

The greatest problem facing China's textile industry presently is that of raw materials. This has two aspects described below. The first is expansion in sources of natural fiber raw materials and the other is the promotion of synthetic fiber production.

Let us consider the first aspect. In the past, a policy based on "food" as the fulcrum was promoted throughout the country, and this caused severe impediment to development of diversification in agricultural production. Afrer the fall of the "gang of four," there was diversification in agriculture suitable for the conditions of any given area such as, for example, stressing the advantages of animal husbandry for the vast plain areas. At the same time, the development of the traditional silkworm industry was promoted in those regions best suited for it. Corresponding to such movements, the latest potential of the woolen textile industry using sheep wool as raw material and the fiber and silk industries were emphasized. In addition, there was considerable leeway for raw material development for linen weaving, but some insufficiency in finishing capacity was indicated (Note 20). In addition, there has been indicated a need to modify the imbalance in the area of the textile industry using natural fiber raw materials where development has taken place mostly along the lines of cotton spinning.

In addition to development in production of a variety of natural fibers, establishment of a synethetic fiber industry is being promoted, and an increase in the ratio of chemical fibers is being emphasized.

The development of China's synthetic fiber industry was greatly motivated by the decline in its raw cotton production. The overall picture was that a rapid large increase in cultivated area of cotton was not a desirable situation since any increase in cotton production would compete with the production of food. There had already been the development and reinforcement of the synthetic fiber industry planned during the adjustment period of the first half of the 1960 decade to indirectly lessen the load on raw cotton through the production of substitute fibers by the so-called "industry supporting agriculture" (industrial departments to support agriculture) concept. It was during this time that new manufacturing plants for fibers such as nylon, vinylon, and acrylic, as well as manufacturing plant technology, were imported from the Western industrial countries.

Beginning with 1970, there was the call that "the entire country put its efforts into light industry, light industry put its efforts into textiles, and textiles put its efforts into synthetic fibers" (Chou Enlai), and there was considerable force directed at the development of the synthetic fiber industry (Note 21). At that time, there was in the background the spectacular development of oil in China, and four synthetic integrated complexes (Shanghai, Liaoning, Tianjin and Sichuan Provinces) using oil and natural gas as raw materials were constructed with leading plant technology introduced from foreign countries. Although all of these plants are not complete as yet, there has already been a tremendous boost in the nation's production capacity. According to Chinese statistics, the production of synthetic fiber during 1980 reached 440,000 tons. This is an increase of more than 53 percent over the 287,000 tons in 1978 just 2 years before (Note 23). With this sudden increase, the amount of total fiber raw material accounted for by synthetic fibers increased to 9 percent in 1979 (Note 24). Needless to say, this level of development still places the country far behind the leading countries of the world.

Now, the development of China's synthetic fiber industry ran into the unexpected reversals in the expected expansion of crude oil production, and the future of oil production did not seem too rosy. Crude oil production in China had been achieving the high rate of growth of about 20 percent a year up to the middle of the 1970's, but this rate of growth decreased as the latter half of the 1970's was entered, and the plateau of 100 million tons was attained in 1978 and is the level presently being maintained. There was a slight decline in production from the preceding year (0.2 percent) in 1980 (Note 25). There is the pessimistic prediction that production in 1985 will be roughly 10-20 percent lower than the present 100 million tons (Note 26).

Added to the stagnation in production is the domestic oil consumption which is growing beyond anticipated levels, and export capacity of oil is sharply declining. The volume of export to Japan which is the largest importer was established by a long-term Japan-China agreement signed in 1978 which called for 9.5 million tons in 1981 and 15 million tons in 1982, but it was reported last fall that only about 8.3 million tons can be exported in these 2 years, with an even more bleak outlook that this year may see an even further cut in exports (Note 27). In this manner, the strategy to use foreign exchange balance obtained by the export of oil to introduce leading plant technology from foreign countries and thereby accelerate modernization was quickly quenched. It is clear that the reinforcement in economic readjustment planned from this year on through the introduction of plant technology mainly through large project construction had to be suspended because of a large miscalculation of the oil supply picture.

Except for the plant tied in with the Shanghai Baoshan Steel Plant, the large projects whose construction had to be suspended were all petrochemical industry related plants. China's crude oil is mainly heavy crude, and it is said that the content of naphtha which is the raw material for the petrochemical industry is extremely low (9.4 percent in the oil from the Taching oilfields and 6 percent in the Shengli oilfields in Shantung) (Note 28). If the production capacity of the petrochemical industry should sharply increase, there will be need for that much more raw materials over what is normally needed. For example, even if the project were completed, it can be assuredly predicted that full operation would not be possible because they would face lack of raw material, and this is thought to have been the factor responsible for the drastic actions that were taken.

If now "5 million tons of crude oil can be drilled, 1 million tons of synthetic fiber can be produced. One million tons of synthetic fiber is equivalent to 20 million dan (1 dan is 50 kilograms) raw cotton" (Note 29), but this optimistic outlook on the future of China's synthetic fiber industry clearly needs to be reassessed.

At the same time, there are reviews and studies being directed on methods of plant technology introduction with regard to the construction of synthetic fiber integrated complexes (Note 30).

III. Developing the Latent Capacity of Existing Synthetic Fiber Enterprises

Up to the present time, the textile industry of China was mainly based on developing its existing enterprises through technological innovations and improvements to "develop their latent capacity" (this is called "Wagian" in China). One classic example is the development of the Shanghai textile industry, the country's largest textile base.

During the 30 years since the founding of the country, there was no basic hope for construction of new plants for Shanghai's textile industry. In addition, close to 100 plants moved or shifted to inland areas. There was roughly a 20 percent reduction in the all important spindles and machines respectively, and there was a reduction in the work force to 400,000 from a maximum of 430,000. Despite this decrease in facilities and workers, the production of the Shanghai textile industry increased 6.5 times during this 30-year span, and labor productivity is said to have increased 3.8 times (Note 31).

This display of developing latent capacities through technological innovation and improvement of old plants rather than through the construction of new ones is well shown by the accompanying statistics. The country invested 510 million yuan to improve the old plants in Shanghai over this 30-year period, but during this period the textile industry of Shanghai turned in 42.6 billion yuan to the government coffers in profits and taxes. There was a return of 83.6 times in the country's investment through taxes and profits (Note 32). Because of this development, the textile industry of Shanghai produces 24 percent of the nation's textiles, and its profits account for 31 percent of the nation's total, despite the fact that its labor force is but 14 percent of the nation's textile labor force. It is also said that textile exports from Shanghai during recent years accounted for about half the total textile exports (Note 33).

Although the Shanghai textile industry is making this large contribution to the nation's effort, there is still a wide gap between the production and the country's and people's needs, as well as a wide gap between the levels of these plants compared to the levels of the leading countries. Many problems are present. For example, many of these products do not have sufficient competitive strength on the international market, many of the plants are crowded and have not been repaired for a long time, there is inadequate capacity for weaving cotton, wool, and synthetic fibers, so the needs of the finishing processes which follow are not adequately filled, there is no balance between the production facilities and the health, welfare, and recreational facilities at the different plants, and past practices such as low regard for improvements in workers, living standards are coming to haunt them (Note 34). The principal factor responsible for these problems is the very small investment made in the textile industry during past years. If the data presented above is reworked, the investment the country made in Shanghai's textile industry amounted to but 1.2 percent of the taxes and profits which the industry turned in.

If now this past policy of bringing out latent capacity to develop the textile industry were to be followed, there may be need for a fixed rate of investment. As mentioned before, there is great likelihood that with the economic readjustments taking place, China's investment in the area of the textile industry will increase over the past. On the other hand, China's present structure is such that there is a built-in limitation to this increase. This is why the people in charge of the Shanghai textile industry are considering means to increase profits and retain a portion of them for improvements to the old industry and to develop productivity as a premise for improving the group welfare (such as quarters) of the workers and increase worker bonuses and thereby reverse the "practices" of the past. This method is called "enterprises nurturing enterprises and using their own efforts to modernize themselves" (Note 36).

Now, the Textile Industry Bureau of the city of Shanghai is operating on the premise of retaining all profits and has guaranteed that production, profits, and export will increase gradually at the rate of 8 percent/year over the next 5 years. With such a guarantee as premise, 90.5 percent of the total profits from the enterprises under the umbrella of this textile bureau will be paid to the government and the remaining 9.5 percent will be retained. Since the 9.5 percent retained will be kept for 5 years, naturally there will be an increase in the absolute value of retained profit as the total profit of this bureau increases.

This total retained profit will be disbursed in the manner that 40 percent will be directed toward developing productivity while 30 percent each will be directed to the group welfare and bonuses for the workers. It is hoped that during the 5 years starting in 1979 a total of 512 million yuan will be available as retained profit production development funds, and this amount will be very close to what the government invested in the textile industry of Shanghai during the 30 years since the founding of the country. It is also said that roughly 40 percent of the sum allotted to the group welfare of the workers will be used for quarters construction (1 million square meters).

In this manner, the characteristic feature of this profit retention plan being followed by the textile industry of Shanghai is not based on individual enterprises but on the city's textile industry bureau as the unit. There are more than 430 textile enterprises under the jurisdiction of this bureau, and each enterprise belongs to one of 11 corporations (for example, cotton textiles, knitted goods, wool and linen, etc) established by industry under the bureau (Note 37). A portion of the total profits of these 430 enterprises will be retained by this bureau and then be distributed to the bureau, corporations and enterprises. For example, the funds from the retained profits earmarked for production development have been estimated to come up to 512 million yuan in the 5-year period starting in 1979, as mentioned before, and 200 million yuan will be retained by the industry bureau, 100 million yuan will be retained by the corporation, and the remaining 212 million yuan by the enterprises (Note 38). This distribution of profit to the corporations' enterprises has merit in that the innovations and improvements which each industry deems very important and which are important from the standpoint of the Shanghai district textile industry overall can proceed as planned.

This profit retention with the bureau as the basic unit is said to be advantageous also from the view that the "imbalance between sweet and bitter" brought about by external conditions can be overcome. Under the situation in our country, the size of the profit is not determined by how well the enterprise is doing but by occasional price increases. A portion of the goods will return greater profit when the price is high, while a portion will return greater profit when the price is low. In this manner, it is not strange that considerable differences in profit levels can arise depending on the type and array of products between industries and enterprises. This is the phenomenon of the so-called "imbalance between sweet and bitter." Taking the example of the Shanghai textile industry, the printing industry through the development of polyesters, mixed cotton fabrics, and medium-length fiber fabrics yielded a profit of 382 million yuan in 1979 by the effort of 26,000 workers. Now, the towel and sheet makers working mainly with purely cotton products while employing 25,000 workers or nearly the same work force as the printing industry was able to reap a profit of only 70 million yuan during 1979. Even within a given industry as, for example, the 19 polyester mixed-product enterprises coming under the cotton textile industry and the 12 enterprises working purely with cotton products showed differences 6-7 times in their profit levels despite the same size labor force (Note 39). It boils down to the situation where mixed synthetic fiber product is more profitable than purely cotton product, and the differences in profit levels between industries and enterprises become greater than necessary bringing out the so-called "imbalance between sweet and bitter" phenomenon.

In order to resolve this matter, the Shanghai Textile Industry Bureau first of all established different profit retention rates according to industry in the process of distributing the total profits of the bureau between the different corporations and the lower-level enterprises, while the amount distributed to individual enterprises within a given type of industry is figured on an internally calculated price rather than the going price. This internally calculated price has no relationship with the commercial departments or consumers and is designed to make for a more rational calculation of the retained profit by each enterprise within a given type of industry (Note 40).

Any revision in these differences in profit levels between industries and enterprises arising from irrationalities in the going price system must come from overall revision of the primary going price. If the adjustment in going price is effective throughout to even adjust to retail price of the consumer goods, there will be some large effect on the people's livelihood. This is why this is something which cannot be readily started unless the proper conditions are set up, and it should not be started. For example, in order to revise the irrational difference in profit levels between industries and enterprises under the going price setup, the method presently in use by the Shanghai Textile Industry Bureau may be evaluated as the next to the best solution. At the same time, should the internally calculated price be able to provide sufficient adjustment capability, it may serve as a basis for future price adjustments.

To be sure, this method of profit retention based on the bureau of the Shanghai textile industry as the unit recognizes the retention of profit by the bureau or by a corporation, and the effect on expansion of autonomy of the lower-level enterprises can be discounted that much. In the particular situation in which the profit retained by the bureau or corporation is used to make technological innovations or improvement considered important for the whole industry, it is often the case that small enterprises are not included, and there seems to be considerable dissatisfaction in them. Consequently, the profit retained by the bureau or corporation should fall within a range necessary to adjust for "sweet and bitter imbalance" among enterprises created by such objective factors such as irrationality in the going price according to a proposal which was made (Note 41).

"Developing of latent capacity" through technological innovation and improvement of existing enterprises is also a subject considered by the textile industries of areas other than Shanghai. Let us now look at the practice followed in Hubei Province (Note 42).

The first step is to revise the product makeup and plan to upgrade quality to medium and high-grade products. This type of management is considered the "key" for the rebirth of the textile industry. The Shanghai textile industry leads in this area as well and is regarded as a model. For example, the amount of the total cotton fiber production accounted for by synthetic and mixed fiber systems of Shanghai was 28.02 percent in 1978, but that of Hubei Province was but 14.33 percent. In addition, the ratio of total fabric production taken up by synthetic fiber and mixed fiber fabric was 33.67 percent at Shanghai while that of Hubei was 17.76 percent. Hubei, which has fallen behind in the matter of higher class goods, broader fabric, and synthetic fiber, plans to direct greater effort to rectify the situation.

The second step is to weed out gradually and in planned manner the ancient and dilapidated facilities of the 1920's and 1930's, renovate the facilities of the 1940's and 1950's, and refurbish part of them to leading levels. This practice has been pinpointed as the material foundation for the rebirth of the textile industry. Looking back on the overall situation of the Hubei province textile industry, the machine facilities can be classified according to the following three types: 1) Machine facilities of foreign make obtained during the 1920 and 1930 decades; 2) Textile machinery of the first generation produced by new China (about the level of foreign equipment of 1940 vintage); 3) Standardized second generation product of new China at the level of 1960 machinery. At the present time, the removal and renovation of the class 1 dilapidated equipment of the 1920's and 1930's is the major objective. These machines not only have low productivity and produce poor quality goods, but getting materials and parts is difficult and maintenance is a problem.

The third step is a fundamental improvement in working conditions. This practice is considered an important "assurance" to lessen the exertion laborers put out, improve the quality of products, and improve the situation of the old industry. This is because poor working conditions are a particularly distressing problem of old industries. Improvements and expansions of air conditioning facilities and increased installation of restrooms, change rooms, and toilets are targeted.

The cotton textile plants of Shanghai and Beijing have been using a three-shift, 1-day rest per week type shift system which has been changed to four-section, three-shift, 2-day rest per 8 days system, which is being favorably accepted by the workers (Note 43). Because there is an increase of an extra section, there is that much increase in number of workers, but this is not an unwelcome situation in cities where there are deepening unemployment problems.

In any event, it may be said that the various practices described above being adopted in Hubei Province are a model example of the renovation and improvement policy of existing enterprises of the country's textile industry.

It may be only natural that the enterprises have some definite authority in management in order to carry out these various practices. The expansion of so-called autonomy of an enterprise may become necessary. The expansion of autonomy in the fiscal management area such as profit retention may be the key to this development. This is because such a course will ensure one's own fiscal sources for technological innovation and improvement. In addition to the above, the retention and operating authority over fixed assets depreciation may become a problem in fiscal management. Up till now, the period for fixed asset depreciation has been extremely long (it is generally 25 years in the industrial area), and the reserve rate in depreciation was pegged at the 40 percent level. In addition, there were severe limitations to the use of new technology for the renovation of facilities, and only renovations termed "duplication of antiques" and "freezing of technological advances" could be performed (Note 44). Not only must the depreciation rate of fixed assets be jacked up considerably, but the depreciation through enterprise retention be increased and modification of rigid regulations regarding renovations be made in order to bring about technology innovation and modification of existing old enterprises. Some of these practices have already been introduced in attempts to expand the autonomy of enterprises.

IV. Development of Textile Industries With Special Regional Characteristics

With the passing of 30 years since the founding of new China, there are now textile industries to be found in every province, city and autonomous region throughout the country in varying scales.

Now, the industry locating policy adopted in China up to the present did not fully take into account the abundance of natural resources in a given area, geographical conditions, existing economic foundations or science and technology levels, and the location with respect to the rest of the country. There was a call for a uniform plan to set up a complete industrial system in each district to seek regional economic self-sufficiency. The cultural revolution was the wedge at which time the so-called "Xiao er guan" [small but complete] type establishment of local industrial systems of small-scale industries and different departments and industries were combined together by region (province level) and sometimes even down to the country. These are examples of what was described above.

In order to elevate the industrial departments known as the textile industry in every region, there was a strong trend to line up all different industries together as one set. As discussed before, the textile industry of China is comprised of the 10 types or lines, cotton textile, wool textile, linen textile, silk textile, printing, knitted fabric, secondary products, textile machinery, and weaving materials, and every locality tried to establish at least one of each kind. The plan to take advantage of the local features by extending the advantages of each region and exploiting the superior properties was avoided. There were times when such a course was criticized in that it brought out local imbalance. This standardization principle and average principle which prevailed in this industrial regional policy is now undergoing reevaluation in view of the situation that today there are considerable textile industries developed in all the regions. The so-called "develop good points, avoid drawbacks," make use of the advantageous features, avoid the shortcomings; and "develop superiority" (exploit the superior aspects of each region) were proposed as a new policy for locating industry, and it seems to be the direction which future development of the textile industry will take.

When the textile industries of each province, city, and autonomous region of the entire country are considered from the viewpoint of how they extend the advantageous features of the district and exploit their superior nature, they can be classified under the following four types (Note 45):

1. Regions which develop superiority in nature resources. Some specific examples are Jiangsu and Hubei for raw cotton, Xinjiang and Nei Monggol for wool, and Sichuan and Zhejiang for silkworm cocoons.

2. Regions with technological superiority. Shanghai, Beijing, Tianjin, Wuxi, and Changzhou are regions which have superiority through their old and new textile industrial bases. In addition, there are regions with superior technology for special types of industry and products. An example is Zhejiang for silk textiles.

3. Regions with superior management advantages. Specifically speaking, this refers to a situation in which a local product is well known in the market and has gained customer trust, the region is located close to a port for foreign trade, and much skilled manpower is at hand. It is well known that the Shanghai textile industry best fulfills these conditions.

4. Regions which combine two or three of the types of features given above.

The following situations are the limiting conditions which determine whether the superiority of the textile industry of a given locality can be developed (Note 46).

The first situation is that a high production quota increase is imposed on the enterprise (plant) each year, and there is always effort directed at exploiting its production capability fully. This situation is summarized by the word "jin" [literally, urgent, tight]. In other words, this points to a situation in which the production plant is assigned excessive production functions which are always pursued to the utmost. Under this situation, it is a natural consequence that even the textile industry of a region with superiority in technology or management is overtaken by increases in production quotas or production amount making it impossible to concentrate on research for new technology as well as to make use of the results and not even to put more strength into production for export.

The second problem is that the quality, specifications, color, and design of the product are all dictated to the enterprise according to the plans of the departments concerned of the higher level organs while the enterprise (plant) is bound hand and foot by these. This situation is summarized by the word "si" [death]. This pressure from above is so severe that it disrupts the intention of the enterprise to improve quality and increase variety.

The third problem is the situation summarized by the character "san" [dispersion]. This singles out the situation in which every local government level and every industrial department tries to plan development in a dispersed manner through its own "domain."

A problem which the textile industry recently has faced is the numerous newly constructed plants particularly in raw material producing regions (Note 47).

It is said that there are some regions where rural people's communes or production brigades have built their own small-scale spinning and weaving plants, silk plants, or knit fiber plants. The textiles produced by these plants in the raw material producing areas are often of inferior quality and the cost is high. This is why many of them have very limited domestic sales and export is well nigh possible. On the other hand, traditional textile centers such as Shanghai and Tianjin are sometimes faced with raw material problems. In other words, the phenomenon of the small plants being built in the raw material producing regions pushing the large plants of the finishing strongholds by "yi xiao jida" [literally, using the small to push aside the large] is taking place in the textile industry. This makes it difficult to combine the technological and operational superiority of the finishing strongholds with the superiority in resources of the new material producing regions.

The following measures have been proposed in order to resolve the situation described above which limits development of the superior features of the different regions. Some of these measures are already being tried out.

First of all, with respect to the situation termed "jin," targets for the rate of increase in production volume is to be determined in line with the degree to which the special features of the region and enterprise can be exploited. The practice up till the present of ignoring economic effects and going for a high rate of increase in an all inclusive, single-minded effort is now being criticized. In addition, the local textile industry's departments concerned are charged with assigning suitable interrelational target goals. For example, the Shanghai Textile Industry Bureau has already put out the following work rule with respect to this problem. Should there be an inconsistency between production quota and production volume, then production volume will prevail. Should production volume be inconsistent with quality and variety of products, then quality and variety will prevail. Should product variety and foreign exchange acquisition be in conflict, then foreign exchange acquisition will prevail. This is said to be the present setup (Note 48). In addition, the granting of autonomy to the enterprise to determine the targets of the various plans may become one of the future subjects. An even better approach will be to propose an economic policy which will coordinate the making of profit and acquisition of foreign exchange with increase in production quotas.

Let us now consider measures for the situation referred to as "si." Here the subject of market supply and demand adjustments is the main thing. This is now being practiced as one phase of the expansion in enterprise autonomy which was initiated countrywide in 1979.

Let us now look at some specific examples of market supply and demand adjustments practiced in Shanghai, Jiangsu and Zhejiang (Note 49).

1. Holding a new-product display and sales conferences. The price of new products is established by joint determination of the industrial and commercial departments concerned and receives approval from the price control departments.

2. Cooperation between plants and stores. There is the case in which plant and store relationship is one in which the concerned plant and store departments in

partnership and the case in which each seeks its own partner. The latter is the case in which the commercial departments strongly request lowering prices of goods which have been directed from export to internal consumption and that in which the plants look on their own for buyers.

3. Establishment of a new-product test retail section. The greater portion (80-90 percent) of the products actually sold in such retail outlets are goods which have been redirected from export to internal consumption, products which the commercial departments were not able to purchase, or products which were produced beyond the planned production of the plant. New products are seen very infrequently.

4. The so-called "private plot" formula. Just as the farmers are allowed "private plots" to earn income, an enterprise (plant) is allowed to use a part of its machinery (1-5 percent) to produce whatever type product it decides to manufacture, and independent search for a sales outlet is a part of this "private plot" method.

5. The so-called "fusion of industry and commerce." In order to advantageously coordinate production and sales, the plants do not leave the sales of products to the discretion of the commercial departments but themselves perform this function, which is called the "fusion of industry and commerce" method. The ribbon lace industry of Shanghai is one industry which has introduced this method and has been coming up with good results.

All of the above methods represent attempts at somehow easing the rigidity in supply and demand adjustments of the present national plan which is unable to cope adequately with the needs of the constantly diversifying market and also to make up for inadequacies. The fact that the tests being conducted by the Shanghai industry are but tentative first steps is indicative of the situation that the above-mentioned methods involve sales which are but 5 percent of total sales and mostly involve products manufactured under national plans which were originally intended for export but were then rerouted for domestic consumption, and new products are still very scarce. Market tests on demand and supply adjustments show the need for future trends to grant the enterprises greater autonomy in the selection of products to be manufactured, modify the present price structure which does not consider good or bad quality with one in which higher price is assigned to products of higher quality, and induce the country to engage in more energetic encouragement and subsidies for the production of new products.

Finally, let us consider the "San" situation (Note 50). First of all, as far as enterprises which have already been built in a dispersed manner are concerned, industrial association is being promoted whereby a cooperative system with division of assignments is made directed at the production of some final products. Some of these efforts include gradual modification and restructuring of counties and people's communes, even the small-scale textile industries which production brigades of communes have set up. At the same time, there will be a restudy of preferred treatment in the form of a 2-3 year period of tax-free status to facilitate dispersed small industry establishment on the part of people's communes and production brigades (Note 51). In addition, the textile industries of the large cities of Shanghai, Beijing, and Tianjin are supporting the production of raw materials through capital and machinery directed to the regions producing raw materials such as cotton, hemp, wool, and silk and ensuring themselves an established raw material supply channel. This is a type of enterprise link-ups spanning provinces and cities which is being encouraged. Furthermore, when a raw material producing region supplies a production region more than the quantity called for by plan, appropriate measures for suitable compensational disbursement, return of goods, and distribution of profits are taken to encourage greater production of raw materials (Note 52). In any event, it is claimed to be more advantageous that raw material producing regions be encouraged to produce more raw materials through proper incentives than for the raw material producing regions to blindly build inefficient small plants of their own.

V. Strengthening Economic Adjustment and the Textile Industry

Because the economic readjustment initiated in 1979 was not sufficiently effective, plans to strengthen readjustment through some modifications were introduced in 1981. The period of economic adjustment was lengthened from that initially anticipated, and the need to continue this readjustment throughout the entire Sixth Five-Year Plan (1981-1985) was formally acknowledged (Note 53).

In the midst of this economic readjustment which had to be strengthened midway, just what direction in development might be expected in China's textile industry? Let us look at the directions and tasks of the textile industry for 1981 hammered out at the national textile industrial bureau heads' conference held in Beijing between 13 and 23 February 1981 (Note 54).

First of all, the need to respond to changes in consumer activities of the people is required of the textile industry. These changes refer to that phase of the people's existence in which the level of clothing is improving. For example, the portion of the nation's retail sales of consumer goods accounted for by retail clothing sales was 22 percent in 1975 and increased to 25.2 percent in 1980 (Note 56). In addition, the results of a recently published survey of 500 households of staff members and workers living in the city of Shanghai showed not only increased disbursements for clothing, but a greater desire to purchase intermediate to higher grade products (Note 57). That is to say, as of the latter half of 1980, the outlay for clothing increased an average of 2.5 times over 1965 and this purchase accounted for 16 percent of the total outlay for product purchases, which represented an increase from the 14.4 percent in 1965. In this category synthetic fiber, wool, and silk textiles and their apparel products type middle and higher class clothing purchases increased by 6.2 times during this same period, and their portion of the total clothing outlay increased to 47.3 percent from 18.9 percent. In another direction, there was the contrasting phenomenon of the portion of disbursements for cotton textiles and cotton apparel versus the total clothing disbursement decreased from 29.6 percent to 9.3 percent. The living standards of staff members and workers of Shanghai probably is tops in this country, but the results of such household surveys are good indicators of the direction of change in the people's consumer habits.

In this manner, it is anticipated that the people will be making new demands for textile products in terms of quantity, quality, variety, and design. The way in which it responds to these demands of the people is what the textile industry faces. That is to say, where the situation in the past was weighted heavily on increased mass production, the once lightly regarded improvement in quality and increase in variety and grades will probably be in greater demand. At the same time, in view of the differences in income levels of the people, the need for ordinary textile products with low price and low profit margin to provide a market for the low income group and higher class products for higher income people to comply with the various needs of the consumer public has been indicated.

Secondly, there is the trend for investment directed at the textile industry under this economic readjustment. There has been a repudiation in this economic readjustment of the one-sided emphasis on priority to heavy industrial development of the past to an emphasis on light industry, including the textile industry, but this does not mean that the scale in capital construction for the textile industry can be expanded unchecked. The textile industry will probably be required to cut down on its construction scale in a corresponding manner. To this end, construction funds are presently the most important and there probably will be an emphasis on projects with economic effect. Some specific investment to objectives include, first of all, the early completion and initiation of operation of important integrated fiber combined complexes which are presently under construction to resolve the present raw material problem. Next in line is probably investment to expand production capacity of the wool industry which at present is beset with demand and supply difficulties. Doubling wool production over the next 5 years is planned. In addition, the finishing and regulating of various textile products after printing are said to be weak, and investment in the renovation and modernization of machinery and facilities in this area is one of the points being emphasized.

In the third place, should the scale of capital construction be cut down, there may be even greater demand to exploit the capabilities of existing enterprises to the limit. One approach which may be necessary is modifying the technology of existing enterprises. Another approach which may be necessary is reorganization, modification, and promotion of combining enterprises spotlighting specialization.

'RENMIN RIBAO' ON ACTIVATING HEAVY INDUSTRY

HK071425 Beijing RENMIN RIBAO in Chinese 30 Nov 81 p 5

[Article by Qi Jian [7871 0256]: "How to Activate Heavy Industry in the Period of Readjustment"]

[Text] Our purpose in activating heavy industry at present is to further implement the principle of readjusting the national economy so as to enable our economy to maintain a certain rate of growth, to rationalize the economic structure and to improve the economic effect. An article entitled: "Activate Heavy Industry to Maintain a Certain Rate of Growth" (carried by this newspaper on 16 October) stressed the significance of activating heavy industry in an effort to maintain a certain rate of growth but hardly dealt with the question of what should be done by heavy industry during the readjustment period. This article deals with this question.

Owing to the influence of leftist guiding ideology that existed for quite a long period in the past, we one-sidedly stressed the importance of developing heavy industry and such a practice resulted in an abnormal structure which was characterized by paying too much attention to heavy industry and neglecting agriculture and light industry, which affected the development of the national economy. One of the important tasks in readjusting the national economy is to put agriculture in an important position and at the same time to step up the development of light industry and slow down the rate of growth of heavy industry so as to readjust the proportionate relations among agriculture, light industry and heavy industry. We have done such work over the past few years with considerable achievements. Good achievements have been made in agricultural production while light industry has been developing faster. The proportion of light industry in 1978 was 43.1 percent of the gross industrial output value. In September this year, it increased to 50.6 percent. The proportion of heavy industry was readjusted down from 56.9 percent to 49.4 percent. As the growth of heavy ndustry has been slowed down, we have consequently been able to use the necessary energy to develop light industry faster so as to ensure market supply, basically stabilize prices and improve people's living standard. The relations between agriculture and industry and the structure within industry has begun to harmonize and this situation has created favorable conditions for further improving the basic proportionate relations of the national economy such as the relations between the two big categories and the relations between accumulation and consumption. It is imperative, from the viewpoint of improving economic effect, to slow down the development of heavy industry.

The profit and tax revenue created by 100 yuan of funds in light industry is much higher than in heavy industry. Statistics show that in 1957, the former was 170 percent higher than the latter while in 1980 it was 210 percent higher. The consumption of energy to create 100 million yuan of heavy industrial output value is about 400 percent higher than light industry. Our gross industrial output value last year was 8.7 percent higher than the previous year and total energy consumption only increased by less than 1 percent. As the proportionate relations between light industry and heavy industry have been readjusted, the economic effect in the utilization of energy has been improved. Last year we saved 35 million tons of standard coal, of which 22 million tons were the result of the improvement in the structure of light industry and heavy industry. If we had not taken any measures to slow down the development of heavy industry, we would not have been able to guarantee the energy that was needed for the growth of light industry last year or this year.

The above-mentioned facts prove that it is imperative to slow down the development of heavy industry during the readjustment period. But some problems have cropped up this year and these problems merit our attention. That is to say, our heavy industry once dropped too drastically and there were objective reasons for such a drop. For quite a long period in the past, our heavy industry was mainly serving its own capital construction. But this year, our capital construction has been drastically curtailed. Consequently, orders for equipment and the purchases of the means of production have decreased and as a result, a number of heavy industrial enterprises did not have production tasks or operated below capacity. But there were also subjective reasons. For example, some comrades misunderstood the slowing down in the development of heavy industry as meaning that the industry was no longer important and consequently they regarded the existing heavy industry as a "burden." Some other comrades did not take active measures to readjust the structure of heavy industrial products and the service orientation of the industry, instead, they just maintained the situation of the industry and advocated that there should be "no changes in orientation and products, no laying off of staff and workers and no changes in equipment; tide over the readjustment to make a comeback." These comrades did not really understand the importance of readjusting heavy industry; on the contrary, they even bore resentment against the principle of readjustment. Because of the influence of such thinking, they decreased the output of products that should not have been decreased or decreased too drastically. Such practice not only hindered the readjustment of heavy industry but also hindered the readjustment of the national economy. If we do not overcome such subjective and objective reasoning and do not strive to change the trend of an excessive drop in heavy industrial production, we will only cause new difficulties for the national economy.

Can we say that to strive to maintain a certain rate of economic growth means that heavy industry should have the same rate of growth as light industry? No. We said that at present, light industry must develop faster than heavy industry. But we must also understand that industrial development is limited by various objective conditions. And first of all is the limitation of energy. No doubt, there are bright prospects for our country in developing energy, but for the next few years it can only be developed slowly and therefore we must mainly rely on saving energy in developing our industry. We have a big potential for saving energy but it needs a process to fully display such potential. Calculation shows that under the situation in which other conditions remain unchanged, the consumption needed for an increase of 1 percent in the growth of our heavy industry will cause the growth of light industry to drop by 4 percent. Therefore in order to ensure the energy that is needed for a faster growth of light industry, we cannot but limit the supply of energy for heavy industry. Under the present conditions in which the supply of energy is tight, it is impossible to demand that heavy industry develop at the same, or at a similar, pace as light industry. Otherwise, the growth of light industry will be drastically slowed down and such a situation is undoubtedly wrong. The development of heavy industry is also limited by other conditions such as the service orientation of the industry and the irrational structure of heavy industrial products. Therefore we must proceed from the present situation to minimize the development of heavy industrial production and strive to stop the drop so that production will gradually increase. Of course, because of different circumstances, the growth of heavy industrial production in one place may differ from other places.

How to activate heavy industry? The key point is to continue to readjust the service orientation of heavy industry and the structure of heavy industrial products and expand the range of service so as to meet the demand of customers. The demand of our national economy for heavy industrial products is enormous and covers many aspects and the demand has not been fully met. For example, the demand of the population in urban and rural areas for certain durable consumer goods is enormous; many peasants need enormous building materials to build their own houses. Following increases in the income of the urban and rural population, the demand for light industrial products will certainly increase and consequently light industry demands that heavy industry supply more means of production. The development of agricultural production also demands that heavy industry supply more and better products. The renewal of equipment and technical innovation in enterprises in particular makes new demands on the part of heavy industry. All these are favorable conditions for activating heavy industry. Heavy industrial departments such as machine building and metallurgy must be further diverted to the correct road of serving the technical innovation of the existing enterprises, serving the home market of agriculture and light industry, expanding exports and serving the modernization of national defense. Many enterprises have done this and surmounted difficulties, thus making contributions to the national economy as well as their own healthy development.

We must be resolute in preventing ourselves from committing again the previous mistakes of blindly developing heavy industry. We must prevent the misunderstanding which regards that by advocating the activation of heavy industry it is not necessary to readjust service orientation and the structure of heavy industrial products, to close down, suspend and merge enterprises and divert them to other production where necessary and to cut back where necessary. We must uphold the principle of realizing the proportionate relations among various economic departments with the main purpose of developing the production of consumer goods. Heavy industrial production must also be arranged according to this principle so that it will be in the interest of fulfilling the tasks of readjusting the economy. This is the correct way to activate heavy industry.

It is imperative for us to pay attention to economic effect in activating heavy industry. To improve economic effect is the key point in our economic work. But for quite a long period in the past, the economic effect of our heavy industry was very bad and no considerable improvement was made over the past few years. It merits our attention that since this year, the quality of some heavy industrial products has dropped while the consumption of energy and raw materials has increased. One of the key points at present in improving the economic effect of heavy industry is to readjust service orientation and the structure of heavy industrial products so that heavy industrial production will accord with social needs. In the process of implementing the principle of readjusting, restructuring, reorganizing and upgrading, it is imperative to enable heavy industrial departments to work hard to improve quality, increase variety and lower consumption and costs so that it will be able to meet the needs of the national economy. A number of heavy industrial enterprises have been able to improve economic effect after decreasing production according to plan and consequently handing over more profits to the state. For example, the steel output of the Shoudu iron and steel plant in the first quarter of this year was 17,000 tons less than the same period last year; but the plant was able to increase profits by 14.8 percent. The Fushun No 2 oil refinery processed 100,000 tons less crude oil in 1980 than 1979, but it increased profits by 61 million yuan while the profits that were handed over to the state increased by 37 million yuan. The volume of crude oil processed by the refinery in the first half of this year again dropped by 2.7 percent, yet the profits continued to increase by 2.6 percent. These enterprises have the common features of improving management and carrying out technical innovation. As a result, they were able to improve quality and lower costs and produce salable products that are in line with market demand. We must popularize the experiences of these enterprises so as to improve economic effect. As the service orientation of heavy industry and the structure of heavy industrial products are becoming more rational and economic effect is improving rapidly, our heavy industry will be able to develop healthily and make greater contributions to the national economy and the modernization program.

In short, in activating heavy industry we must handle well the relations of economic growth, economic structure and economic effect. With regard to the view which considered the speed that can be reached as "leftist," the previous article pointed out that economic growth is the basis for a change in economic structure. Such a definition is based on the general trend in the development of social history. From the historical viewpoint, the structure of the manufacturing industry, the structure of distribution and the structure of consumption will change along with the growth of the economy. But it is not complete because it does not stress the significance of the important role of the economic structure in developing the economy and the proportionate relations during the current readjustment. The history of economic construction in our country over the past 32 years shows that the economy will be able to grow healthily and better economic effect is guaranteed only when the economic structure and proportionate relations are rational; otherwise they will affect the growth of the economy as well as the economic effect.

BEIJING RADIO INTERVIEWS ZHEJIANG'S TIE YING AT NPC

OW140623 Beijing in English to North America 0000 GMT 9 Dec 81

[Text] Premier Zhao Ziyang told the NPC last week that, compared with the corresponding period of last year, China's gross industrial output dropped by 0.2 percent in the first quarter and increased 1.7 percent in the second quarter. In the third quarter, it was up 3 percent, and in October, 10 percent. Zhejiang Province, in coastal east China, is among those regions leading the country in industrial development. Radio Beijing's correspondent (Chen Feng) talked with the first secretary of the CCP Committee of Zhejiang Province, Tie Ying, who is attending the NPC session in Beijing as a deputy.

Tie Ying wrote out some figures for Zhejiang's industrial growth since December 1978, when the country's economic readjustment program began. The rate of increase was close to 18 percent in 1979 and 27 percent in 1980. Industrial output from January to October this year was 12 percent over the same period last year. Light industry is taking up an increasingly bigger proportion in the province's total industrial output value. It will reach 63 percent this year.

Tie Ying said such a fast rate of increase has had no parallel in his province. Compared with 1976, profits and tax income from industry last year have risen more than threefold. Tie Ying explained how this was achieved.

He said: To put it in a nutshell, it is possible because they had carried out the policies and principles on economic readjustment laid down by the CCP Central Committee and they had done so in light of concrete conditions in Zhejiang. Zhejiang has a good climate with plenty of rainfall, making it extremely favorable for growing all kinds of crops. Moreover, Zhejiang has a fairly good foundation in light and textile industry. The province, therefore, decided to develop a diversified economy instead of developing only grain production. Now, many counties have set up bases for growing raw materials to feed the light industry. As a result, besides a slight increase in the grain output, 1981 has seen major increases in the output of tea, oranges, rapeseeds and so on. There has been a boom in rabbit raising, which is guaranteeing an ever-growing supply of rabbit fur for the woolen textile industry. Flexible policies with regard to purchasing prices and taxation have boosted the peasants' initiatives.

Another reason for the fast rate of industrial growth in Zhejiang Province is the reorientation of heavy industry. This again is part of the central government's readjustment policy. While, in the past, heavy industry served almost only heavy industry, it was now reorientated to serve light and textile industry, that is, to supply the equipment for retooling and technical transformation of the factories producing textile and other consumer goods. In this way, heavy industry in Zhejiang Province has maintained an annual growth of 5 percent when it dropped for the country as a whole.

Tie Ying also gave credit to the rapid growth of collectively-owned and commune-run factories. He said their production accounted for 40 percent of the province's total industrial output value. These factories are encouraged under the present policy as a supplement to state-run enterprises.

Tie Ying also described the effort made to renovate existing factories, which has resulted in the fast growth of output value. He said the funds used for technical transformation this year was more than 10 times that as in 1978, and most of the money was spent on retooling the light and textile industry and for energy conservation. Zhejiang Province, Tie Ying said, has very little coal, and therefore, a shortage of fuel. Remodeling boilers with a mind to saving coal consumption has been a major task. Much has been achieved in this respect by the small chemical fertlizer plants in which the province abounds. The province has also built a good number of small hydroelectric power stations and popularized methane gas and bone coal.

Industrial development in Zhejiang Province is now in orbit. The readjustments are beginning to show their effect. A more rational industrial structure is taking shape. Tie Ying looks with confidence to a steady growth in the coming year.

BRIEFS

JILIN LIGHT INDUSTRY--The Changchun First Light Industrial Bureau had prefulfilled the annual production plan by 27 days as of 4 December. The total output value reached 288.33 yuan, an increase of 15.3 percent over the corresponding 1980 period. [SK091008 Changchun Jilin Provincial Service in Mandarin 2200 GMT 8 Dec 81]

XINJIANG WOOLEN GOODS PRODUCTION--From January to September this year, Xinjiang region increased production of woolen goods by 36.1 percent over the corresponding period last year. In addition to production of woolen goods, regional production on the whole also increased to varying degrees. In the wake of increased production, the income of the masses increased and their livelihood improved. As a result, the people's purchasing power also increased. From January to September, some 21 million polyester cotton and synthetic fabric garments were sold, an increase of 42.4 percent over the corresponding period last year. [HK020626 Urumqi Xinjiang Regional Service in Mandarin 1300 GMT 19 Nov 81]

GUANGDONG MUNICIPALITY'S INDUSTRIAL PRODUCTION--Shenzhen Municipality has developed industrial production relatively quickly this year. By the end of October, the municipality had fulfilled its total industrial output value of some 120 million yuan, which was 76 percent more than in the corresponding period last year. The municipality fulfilled its total industrial output value for this year 2 months ahead of schedule. The municipality has developed light industry more quickly than heavy industry, especially its production of electric appliances. By the end of October, the municipality had fulfilled its light industrial output value of some 114 million yuan, which accounted for 93 percent of its total industrial output value and was 80 percent more than in the corresponding period last year. The municipality has carried out mass production of quality bedsheets, radio-cassette players, black and white TV sets and quality furniture. SHENYANG COMPANY CHECKS BACKDOOR DEALINGS

SK130557 Shenyang Liaoning Provincial Service in Mandarin 2200 GMT 11 Dec 81

[Text] Shenyang Municipal Foodstuffs Company and its subordinate egg and poultry buying and selling stations recently engaged in backdoor dealings with commercial units and individuals which have relations with the company or its subordinate stations.

According to initial statistics, in the 3 months between 15 August and 15 November, these stations sold through backdoor dealings some 30,000 jin of eggs and 1,o00 jin of beef and mutton at parity prices. Why does the foodstuff company repeatedly engage in backdoor dealings regardless of the party's discipline?

As far as can be understood, leaders of the foodstuff company and its subordinate business stations are afraid of three things. First, they are afraid of offending the higher authorities. They have satisfied all demands advanced by personnel of the higher authorities regardless of whether the demands are reasonable or not. For instance, these buying and selling stations have sold foodstuffs through backdoor dealings at the demand of a higher department on 30 occasions since 15 August.

Second, they are afraid of offending business units. For instance, they dare not hurt the feelings of personnel working at the (Dacheng) railway station for fear they would make things difficult for the company.

Third, they are afraid of offending business units and causing bad consequences for the workers. For instance, they have readily agreed to sell 800,000 jin of good eggs to a mess hall responsible person of the Shenyang Municipal Liquefied Gas Administrative Office.

Because of these fears, the company CCP Committee hesitates to check backdoor dealings. The company and its subordinate units urge persons at the upper and lower levels to check unhealthy tendencies and to strictly punish those who make things difficult for persons refusing to engage in backdoor dealings.

Why does the Shenyang Foodstuffs Company fail to check backdoor dealings? We blame the company leaders for their lax and weak leadership and their lack of determination in dealing with these cases. Nevertheless, we must not forget to blame the officials and persons who come to do backdoor dealings and who we cannot afford to offend. Our province still has many officials who exploit their positions and power to seek personal gains. The three fears stated by the Shenyang Municipal Foodstuff Company are of significance. This episode tells the people that to check the unhealthy tendency of backdoor dealings, we need the efforts of all quarters. Those who make things difficult for persons refusing to help them engage in backdoor dealings must be strictly dealt with. In doing so, we can stop backdoor dealings.

BRIEFS

GUANGDONG COMMODITY PRICES INSPECTION--A joint provincial and municipal group for inspection of commodity prices was officially established in Guangzhou on 28 November. Yang Deyuang, the vice governor of the province is the group leader while the vice mayor of Guangzhou Municipality, Zuo Ming, is the deputy group leader. The main duties of the inspection group are implementing the notice of the Provincial People's Government on stabilizing commodity prices and adopting measures to ensure that the prices of daily commodities are stable. At the same time, the inspection group will investigate and rectify the internal problems of all state-owned businesses, supply and marketing cooperatives, as well as industrial and commercial enterprises. The inspection group will send sub-groups to carry out investigations in Guangzhou Municipality and in other regions. The investigation starts on 1 December and will last for about 1 month. FOREIGN TRADE

SPECIAL ECONOMIC ZONE AT SHENCHUAN TO SUPPLY FOOD TO HONG KONG

Guangzhou YANGCHENG RIBAO in Chinese 28 Oct 81 p 2

[Article by Lei Qiang [7191 1730] and Li Kaiyun [2621 7030 0061]: "How Shenchuan Agriculture Adapts To Development of Special Economic Zone"]

[Text] Shenchuan Prefecture wants to build a special composite economic zone with diverse trades and industries including processing industries for exports, housing industries, the tourist trade, and agricultural sideline industries to take advantage of its geographical position and economic conditions. In this special composite area, agriculture will occupy the major position, and as the economy of the special area develops, agriculture will increasingly demonstrate its important role. How to make Shenchuan's agriculture adapt to development of the special economic zone is an important problem currently requiring examination.

Shenchuan City is located on the east bank of the Pearl River, mountains at its back and the sea at its front. It is adjacent to British Kowloon, and is a land of plenty on the Pearl River delta. It possesses natural advantages for the development of agriculture. Looked at in terms of construction of the special economic zone itself, supply of fresh produce markets in Hong Kong and Kowloon, and rapid increase in the income of the masses in the special zone, vigorous development of Shenchuan's agriculture will be required. Right now vigorous action has to be taken to gradually change the backward condition of Shenchuan's agriculture to meet the requirements of development of the special economic zone.

1. Vigorous Building of High Quality Fresh Produce Production Base. During the past 2 years, for the purpose of increasing goods available for foreign trade and to supply market needs, Shenchuan has constructed a group of fresh produce production bases. However, for various reasons development of these production bases has not been balanced. Some of them have played a very good role while others either contracted or stopped operating after a period of development, and some of them never went into operation at all. Shenchuan's chicken raising industry was one industry that worked out fairly well and developed fairly rapidly. In 1978, it provided only 30,000 chickens for export. In 1979, it provided 300,000; in 1980, 630,000; and during the first half of 1981, the number reached 530,000. It is estimated that 1.3 million will be provided for the entire year. There are 36 chicken farms in continuous operation and raising more than 1 million chickens. Once the problems of supply of mixed feeds and seedlings for perennial crops have been

solved, the chicken raising industry can develop to become quite large. At the present time, mass enthusiasm for the raising of chickens is very high. While the quantity of chicken sales in Hong Kong and Kowloon annually reaches 36 million, China exports only 10 million annually. The potential for chicken sales to Hong Kong-Kowloon market is very great, so we must continue to consolidate the vigorous development of these old chicken raising bases in order to expand the Hong Kong-Kowloon market and meet the needs of the special zone.

Shenchuan currently has only somewhat more than 5,000 mu export vegetable base. Figuring 3 li [0.66 square meters] of vegetable land per urban resident, Hong Kong and Kowloon, with a population of more than 5 million, will need 150,000 mu of land for vegetable production. Therefore, if Shenchuan's advantages for taking a predominant position in the Hong Kong-Kowloon vegetable market are to be exploited, in addition to efforts of other kinds, it is necessary as well to gradually enlarge the growing area of the vegetable production bases.

Shenchuan's hog raising has also seen fairly great development with the building of 126 fairly large hog farms and 900 small hog farms with an investment of 3.8 million yuan. Later on because of failure to solve the problem of seedlings for perennial crops, a cessation of importation of mixed livestock feeds, and no implementation of policies, 220 hog farms went out of business throughout the city this year, and the number of hogs raised declined in a straight line. In 1978, 276,000 head were raised, but by 1980 only 160,000 head were raised, a loss of more than 100,000 head. Now the masses raise native breeds of hogs, for the most part, and feed them locally obtained feeds. Local breeds of hogs have much fat and little lean meat, sell at a low price, and are not much favored. In future, it will be necessary to implement policies and make efforts at solving the problems of seedlings for perennial crops and livestock feeds, build superior variety hog farms, concentrate on restoration of some commune and brigade hog farm production, gradually expand the quantity of livestock feed, and increase the number of hogs meeting export standards.

The key to future growth in poultry production bases lies in the introduction of superior varieties and in production of mixed feeds. Superior variety poultry farms and livestock feed plants must be set up to support development of poultry bases. In short, it is necessary to adapt general methods to specific situations, consolidate and develop existing production bases, create conditions, revive old bases, and set up new bases in order to meet the needs of large scale development of agriculture.

2. Make the Most of the Role of Shenchuan's Non-Special Area Agriculture. In Baoan County, of which Shenchuan is a part, and in areas adjacent to the special zone, geographical conditions are similar; the territory is vast, and there is lots of elbow room. In Baoan County, conditions are excellent for the building of vegetable, peanut, aquatic products, livestock, fruit, and such fresh and live produce production bases. A survey shows that Baoan County could best establish a strategic program for supplying mostly high quality fresh produce to the Shenchuan special zone and for export to Hong Kong and Macao, vigorously develop production of fresh produce, and gradually make Baoan County truly become a major supply base of farm products for the Shenchuan special zone and for Hong Kong and Kowloon.

3. Key Lies in Genuine Implementation of Special Policies and Flexible Measures. The Special Economic Zone must carry out more preferential policies for agriculture to attract foreign capital, advanced techniques, superior varieties, and methods of administration and management. Special preference has to be given some advanced techniques that are particularly advantageous in China's fresh produce production. In the case of modern high density fish and shrimp farms, ocean hatcheries, superior variety poultry farms, and mixed feed plants, which are able to play a role in demonstrating and promoting research and production, more preferential conditions have to be provided for the sake of promoting Shenchuan's agricultural development. Shenchuan's non-special zone agriculture should also benefit from the pertinent imported preferential treatment for the special zone agriculture.

The evil of stifling uniformity in management of fresh produce production has to be reformed, local areas and enterprises being allowed greater autonomy. At the present time, farm produce exported from the Shenchuan area has to be transported from the producing areas to the Wenjin ferry crossing where it is unloaded from vehicles and transported by the harbor trucking corp to Hong Kong. There are several links in the journey, and ordinarily more than a day's time is required, resulting in an extremely high damage or death rate each time. After the fresh and live produce arrives in Hong Kong, it is sold to the commissioned dealer of livestock yard, and the amount damaged, dead or lost are our responsibility. Dealer commissions that are too high, or failure to make payments promptly, seriously affect capital circulation and increase interests payments. All this directly impacts on local and grassroots initiative. We believe that the Shenchuan authorities concerned can organize the direct shipment to Hong Kong of fresh produce from the Shenchuan area, and after the goods is unloaded, imported goods can be loaded for the return journey so that trucks do not have to return empty, saving on transportation expenses for the Hong Kong segment. Otherwise, contracts may be signed with foreign traders that designate areas, with Hong Kong traders providing transportation and containers for export directly from the producing area with payment being made on the same day. Shenchuan departments concerned can also strive to set up multipurpose stores for meat, fruit, vegetables, and poultry in densely populated areas in Kowloon and the New Territories, and set up points for the sale of fresh produce, people producing it, transporting it, and selling it by themselves and getting payment on the same day.

4. Need for Gradual Readjustment of Structure of Shenchuan Agricultural Production in Adaptation To Development of Special Zone Economy. Last year the area planted to grain in Shenchuan was more than 300,000 mu amounting to more than 80 percent of the area cropped. This is not in line with development of Shenchuan as a special economic zone, or as a fresh produce supply base for Hong Kong and Kowloon. There must be further readjustment of the irrational structure of agricultural production with continued reductions in the area devoted to grain and to other economic crops such as sugarcane in a change to various fresh agricultural produce. When grain is lacking because of the reduction in the grain growing area, the system of "imports to support exports" may be employed, using export of fresh agricultural produce to earn foreign exchange and buying grain directly from Hong Kong for import. For the Shenchuan special zone, this would be extremely worthwhile.

Real implementation of the aforestated measures requires clarification of the direction of development of Shenchuan's agriculture in guiding thought. Most important is vigorous support from policy measures for production of fresh agricultural produce, which can be gradually realized only through arduous efforts. At the present time, progress is very slow in Shenchuan's development of fresh agricultural produce production. The Shenchuan special economic zone's agriculture urgently requires development, and superior conditions make large-scale development possible. The key still lies in real implementation of special policies and flexible measures.

FOREIGN TRADE

ARGUMENTS AGAINST AUTARKY AIRED

Beijing GUOJI MAOYI WENTI [INTERNATIONAL TRADE JOURNAL] in Chinese No 3 1981 pp 17-22

[Article by Chen Shouqi [7115 1108 3823]: "Make the Most of Advantages With Active Participation in the International Division of Labor"]

[Text]

(1)

The accentuation of strengths and the downplaying of weaknesses to make the most of advantages is a major program for the development of China's production, development of commodity flow, and undertaking socialist economic construction in accordance with economic laws.

In domestic terms, full implementation of this policy means that each region must undertake an economic analysis of production on the basis of its resources, workforce, capital, technology, and other such objective conditions, as compared to other areas, and do more of what is advantageous to the producer in areas of strength. Programs not advantageous to producers, or those in areas of weaknesses should either not be done or done but little, thereby effecting a rearrangement of production, establishing reasonable divisions of labor by regions and a unified system of domestic markets, and developing domestic trade to promote the building of the four modernizations.

In foreign terms, the implementation of this policy means carrying out analyses of products based on China's total resources, labor, capital, technology, and other such objective conditions, comparing this to foreign countries, and then concentrating on those products which are beneficial to the producers and which they are good at, while cutting back or stopping production of those which are not beneficial to the producers, or which they are not good at. Vigorous export of products for which China possesses a production advantage in exchange for products for which China is at a disadvantage in production should be done in active participation in an international division of labor, for active entry into international markets, and to make the most of foreign trade to advance four modernizations construction.

The accentuation of strengths, downplaying of weaknesses, and making the most of advantages are closely relately and interlinked both in their domestic and foreign aspects. In the development of optimum production, in addition to making comparisons among one place and another within China, some trades and industries and some products should be compared with the situation in foreign countries to make plans in concert with both a domestic division of labor and an international division of labor. In the development of commodity flow, quite apart from strengthening of market relations in various areas inside China, one must also strengthen relations with international markets in the case of some trades and industries and some products, combining the planning of domestic trade with planning for foreign trade. Both aspects play a role of mutual influence and mutual promotion, which are two links in carrying forward the socialist commodity economy.

This article puts forward some preliminary views only on the issue of how to actively participate in an international division of labor and vigorously develop foreign trade.

(2)

The international division of labor is an objective process of modern economic development that does not depend on an act of will. Whether one participates or does not participate in an international division of labor is not something one chooses to do. When any given country conducts foreign trade, it is participating in an international division of labor. No country in the world can place itself in a position of being outside an international division of labor and international trade. China is no exception. However, how a country participates in an international division of labor, and what kinds of products a country produces, or what kinds of goods a country exchanges with foreign countries must be a matter of choice, and can be chosen. Every independent country has to make such choices, and as a socialist country, China must make such choices all the more so, using as the point of departure in making such choices overall objectives in realizing the socialist four modernizations. Choice consists of comparing production conditions inside and outside one's own country, accentuating strengths, playing down weaknesses and making the most of the advantages of one's own country so as to derive relatively great economic benefits from being a part of the international division of labor.

Here the problem is with which kinds of foreign countries to make comparisons. The various countries of the world are in different stages of economic development. Some are economically advanced countries, while a greater number are developing countries. Their production conditions differ, so comparisons must be conducted individually. However, in terms of China's foreign trade picture, it is the economically advanced countries that are China's major adversary. They account for about 70 percent of China's import-export trade regularly. This state of affairs will not change within a short period of time. This is because developed countries are capable of supplying China with the technical equipment and materials in short supply that are needed in the four modernizations, and they are able to provide China needed markets for expansion of its exports. When we participate in an international division of labor, we are largely participating in a division of labor with developed countries. The comparison of advantageous and disadvantageous production conditions is also done largely with developed countries.

In comparison with foreign countries, abundant resources and a large workforce are the advantages China possesses. Insufficient capital and backward technology are China's disadvantages. To accentuate strengths and play down weaknesses, China will have to develop industrial production that uses fairly large amounts of resources, and to which labor input is high, but which require relatively little capital and have low technological requirements; i.e., development of labor-intensive industries. It has to downplay development of capital (or technology) intensive industries. Commensurately, the export emphasis must be placed on labor-intensive goods, and the import emphasis must be placed on capital (or technology) intensive goods. Exchange of goods that can be produced at a profit for goods that cannot be produced at a profit is most profitable.

Labor-intensive goods means goods for which the labor intensivity rate is high and the capital (or technology) intensivity rate is low. By expanding production of this line of goods, not only can more resources be used, but employment may also be increased. At the same time, a greater saving in capital and a greater saving in technical equipment may also be effected, with the result that management will be fairly easy and productivity fairly rapidly formed. At the same time, production costs will be relative low, prices relatively low, and competition relatively strong, making for ease in breaking into the international market. This helps make the most of production advantages and export advantages.

By comparison with developed countries, China is in a disadvantageous position in the development of capital (or technology) intensive industries. Some products for which the capital (or technology) intensivity rate is high, particularly certain high-grade, precision, and advanced products, will be restricted in their production for lack of capital and technology. For the time being, China can produce some other products only with difficulty, and were it to produce them, because of high production costs and high prices, it would be difficult for them to compete with those from developed countries. Therefore, for China to produce them would not be as advantageous as importing them.

Expansion of labor-intensive industries under conditions of limited capital accumulation and limited investment means investment of capital and labor in areas in which productivity is relatively great, and little investment in areas in which productivity is slight so as to increase the effectiveness of capital and labor investment. Use of these advantageously produced products in exchange for products advantageously produced abroad is to derive great economic benefits for a relatively low cost. Thus, the role of international division of labor to save social labor and increase social productivity is served.

From this may be seen that joining in an international division of labor is an important supplement to self-reliance. When a country uses the production strengths of foreign countries together with its own production strengths, in addition to relying on the strengths of one's own country, one is also using the strengths of other countries. As compared with countries that do not join in an international division of labor, and in comparison with sealing oneself off, the national strength of one's own country is increased.

International division of labor and foreign trade also function as "conductors." The process of participating in an international division of labor and carrying on foreign trade inevitably leads to management capabilities, technological capabilities, and competitive capabilities, and these three things are precisely those in which we currently are experiencing insufficiency.

It must be pointed out that in China's expansion of labor-intensive products in order to join in an international division of labor, most important is the expansion of labor-intensive industrial products for export. This is China's main orientation in joining in the division of labor with developed countries. As for other labor-intensive products such as special agricultural sideline native products, and handicrafts (arts and crafts), there naturally must also be active development of production and active expansion of exports. This is also one aspect of China's participation in an international division of labor (with developed countries). However, this is most certainly not the main orientation. This is not only because the orientation of China's development of industry is modern industry and not the handicrafts industry, but also because of the limitations of handicraft production in that quantity increases in output of items supplied for export is not readily possible. Another limitation is the consumption habits of developed countries in which the capacity of the market cannot be readily enlarged. There is not a single country in the world that has scored outstanding victories through competition in international markets by relying principally on handicrafts.

Our advocacy of the development of labor-intensive industries for participation in an international division of labor is not to say that we should entirely remove ourselves from capital (or technology) intensive industries, nor is it to say that we should rest content with such a division of labor structure. In the case of goods for which the capital (or technology) intensiveness is not too high, not only should we take the measure of our capabilities for development for the sake of the needs of domestic construction, but we should develop such goods with the needs of developing countries in mind. In addition, in the realm of capital (or technology) intensive goods, we are, it is true, in an inferior position relative to industrially advanced countries; however, this is not the same as forever being in an inferior position. In the future, we too can gradually move from inferiority to superiority, and the international division of labor structure can also change. Of course, this is not something that can be accomplished within a short period of time. Therefore, being realistic, for a fairly long period of time, it will be best for China to participate in an international division of labor largely through development of labor-intensive products, particularly through development of labor-intensive industrial goods.

(3)

China's export of labor-intensive industrial goods in exchange for capital (or technology) intensive industrial goods is exactly the same trend in the division of labor that has been going on in recent years between developing countries and developed countries. This is to say that it accords with an objective tendency.

In recent years as developing countries' industrialization has progressed, and as labor intensive industries have developed, their export of products to industrial countries has steadily increased. In addition, as a result of changes in the industrial structure brought about by the technological revolution, developed countries have developed even further their capital (and technology) intensive industries, and their export of products to developing countries has also increased. Formerly, developing countries produced mostly primary products, but now they are actively increasing their labor-intensive industries and capital (or technology) intensive industries, but now they emphasize development of capital (or technology) intensive industries. Such a change in production must inevitably be reflected in trade. In terms of long range developmental trends, in their mutual trade, the ratio of these two categories of goods will increase more and more.

In world trade in capital (or technology) intensive industrial goods, exports from developed countries have always maintained a monopoly position, but an overwhelming majority of this trade goes on among industrially advanced countries themselves. In recent years, exports to developing countries have gradually increased. This has been true particularly in machine equipment, communications and transportation gear, and precision instruments. In these lines, the increase has been remarkable. Such a direction of flow precisely reflects the dominance of industrially advanced countries and the inferiority of developing countries.

World trade in labor intensive industrial goods does not operate this way. Briefly, such exports by developing countries are greater than imports, but in some areas exports from developing countries are greater than imports.

One such area is textiles. In recent years developing countries have become net exporters and developed countries have become net importers of textiles. Developing countries have shown a favorable balance of trade, while developed countries have shown an unfavorable balance of trade, and this is growing annually. Formerly, developing countries were rivals of developed countries for textile markets, but now textiles from developing countries have begun to compete in the markets of developed countries. Naturally, it took a fight for the textiles of developing countries to get into the markets of developed countries (things such as developed countries accepting a general benefit system).

Machine industries are, in principle, also labor-intensive industries, and only when the labor productivity rate of developing countries is high do they possess an advantage in this field. In recent years with the development of machine industries in developing countries, some products have begun to gain dominance. One example is ordinary machine tools, which developed countries have always shipped to developing countries. In recent years, exports by the latter to the former have strikingly increased. Machine tools imported by the United States from developing countries amount to 9 percent of its machine tool imports. This is principally due to it being more advantageous for American concerns to produce high grade machine tools rather than ordinary machine tools, so it is better to import ordinary machine tools than make them themselves. This shows that the United States is in a position of relative inferiority while developing countries are in a position of relative superiority.

Accompanying the development by developing countries of labor intensive industries, and accompanying the development by developed countries of capital (and technology) intensive industries will be a rise in the dominance of developing countries in labor intensive industrial goods and an inferiority in such goods among developed countries.

China's development of labor intensive industrial goods for export in exchange for capital (or technology) intensive industrial goods is also entirely the same trend that has been taking place in the division of labor between China and developed countries.

In China's trade with developed countries, the ratio of labor intensive industrial goods exported is steadily increasing, and the ratio of capital (or technology) intensive goods imported is steadily rising. This tendency can only increase rather than decrease as China's economic construction progresses.

A look at the structure of goods traded by China and Japan shows that Japan's imports from China of fiber products, chemical products, wood products, and fur products account for 43.4 percent of the total, a relatively large amount being labor intensive industrial goods. Mineral products (including petroleum) amount to 43.5 percent. In Japan's exports to China, metals and metal products, machinery, motor vehicles and ships, chemical products, and optical instruments amount to 77.4 percent of the total, an overwhelming majority being capital (or technology) intensive industrial products. This structure is basically commensurate with the economic development of the two countries.

From this may be seen that increase in China's labor intensive industrial goods for exchange with industrially advanced countries for capital (or technology) intensive industrial goods both makes the most of our own strengths and permits use of foreign strengths. Such a division of labor accords with the objective tendency in economic development and accords with the needs of four modernizations construction. It should be actively engaged in a vigorously developed.

(4)

Active participation in international division of labor and active development of foreign trade requires a system than can assure it. But right now China's national economic system, including the foreign trade system, is still undergoing reform, so it is still not possible to say that a full assurance can be given. In both making the most of China's advantages and in making use of the advantages of foreign countries, numerous obstacles are encountered that do not permit making the most of our own advantages or using the advantages of others very well.

Though China has an advantage in the production of labor-intensive goods, the domestic price must be lower than the price abroad. The actual situation is just the reverse. In an overwhelming majority of cases, the prices of goods are higher than in foreign countries, meaning export losses and poor competitiveness. A production advantage is not turned into an export advantage.

In the production of capital (or technology) intensive goods, since developed countries possess the advantage, it is only normal that prices for such goods inside China should be higher than prices abroad, but for a large number of such items, the price for the same kind of goods produced in China is vastly higher than the import price leading to an import surplus. Producing concerns are unable to get low priced technical equipment and a supply of intermediate products, with the result that the foreign advantage cannot be put to use, and China's inferiority cannot be effectively remedied.

For export losses to become a regular and large scale phenomenon is very irrational. When this goes on for a long time and the abnormal becomes normal, some people suppose that export losses merely seem to be losses and that import surpluses are regularly greater than import losses so that in the overall accounting, there is no loss. Some people suppose that trade enterprises have export losses while industrial enterprises have profits, so the state subsidizes losses from profits, and everything is turned into a profit; it is only a bookkeeping matter. Such a view is manifestly very onesided. This is to look at matters only in bookkeeping terms and to overlook this situation not being good for the strengthening of the economic accounting of enterprises or for improving administration and management. It is disadvantageous to the encouragement of exports and places a limit on imports. It is particularly unfavorable in making the most of China's advantages or making use of foreign strengths. In short, it hampers active development of foreign trade.

There are numerous reasons for the aforementioned situation, which may be summarized principally as follows:

(1) Overpricing of renminbi in terms of foreign exchange. The price of export goods is high when list prices are converted to prices in foreign currency. Prices of imported goods, in terms of list prices converted to renminbi, are at a low level. Overly high foreign exchange prices impede exports and encourage imports.

(2) Differences between domestic price levels and foreign price levels. Generally speaking, domestic price levels are high while foreign price levels are generally comparatively low, meaning purchase at high prices for export at low prices. Naturally, this results in losses, and in the case of industrial goods, losses are particularly great. In the case of imported goods, the foreign price, when converted to renminbi, is comparatively low, but the allocation price set on them inside China is very high. Importation at a low price and allocation at a high price naturally produces a surplus. But in recent years, owing to the rapid price increase in the international market of imported goods while no change has been made in the domestic allocation price has led to a surplus becoming a loss.

(3) Overly high profits of industrial concerns. High profits when added to costs of concerns involved in foreign trade correspondingly increase losses. Production enterprises have high ex-factory prices and high profits from domestic trade, and low ex-factory prices and low profits from foreign trade. This makes production enterprises lack enthusiasm for exports.

(4) Numerous taxes. At every stage in the manufacture and sale of export goods, a tax is levied and value added, increasing costs and making the ex-factory price higher. This increases export losses and impedes exports.

This flawed situation in the management system has endured for many years to become today an obstacle on the road to progress in foreign trade.

This year's initiation of tests of an internal admustment of conversion rates for foreign exchange derived from trade, which focuses on current bad practices and strikes out on a new path, represents a breakthrough in the management system. It is a major reform. In another realm, the gradual step-by-step reduction or exemption from industrial and business taxes lowers foreign trade purchase prices and readjusts distribution of industrial and trade profits. These things will greatly help active participation in an international division of labor, and greatly help great development of foreign trade.

However, it should be realized that in order to further eliminate obstacles for the development of foreign trade, it will be necessary henceforth, to continue to carry out reforms from this foundation. Sole reliance on these present measures makes it difficult to eliminate export losses, difficult to institute all around responsibility for profits and losses, difficult to vigorously develop production of export goods, and difficult to smoothly organize imports. This means that it is difficult as well to make the most of China's advantages and to effectively use foreign advantages.

Following the internal readjustment of conversion rates for foreign exchange derived from trade, special agricultural sideline native products will be sold at profit instead of loss. For a substantial number of industrial products losses will continue, particularly in the large cities of Beijing, Tianjin, and Shanghai, which have numerous industrial goods for export and the losses on industrial goods is differences in price levels inside and outside China, and not because of lack of advantages for their production. Perhaps it might be possible to change to use of average exchange cost of industrial export goods as the basis for setting the [foreign] trade conversion rates so that most industrial goods will show a profit, or at least no loss, and so arouse the enthusiasm of enterprises for exports and make other export items more profitable, as well as stimulating further increase in exports. Such a method would be helpful in all around encouragement of export policy and help make the most of China's advantages in production.

In the future, the price fixed for imported goods will generally be higher than the price for the same kinds of domestic goods. This is a measure to put a brake on imports and protect domestic production, which has a positive function. However, if protected industries and enterprises (including export industries and enterprises) use high priced imported equipment and raw and processed materials, this will correspondingly increase costs, thereby impeding competitiveness and weakening the aforestated protection function, and produce a negative function. Possible consideration should be given a change from setting of prices for imported goods to setting of import prices on the basis of individual importing agents, and also strengthening the import permit system to strictly limit imports. This action would both help put into effect a policy of suitable limitation of imports, and would help in making use of foreign advantages.

The problems of levying taxes and adding value at every stage, and overly high profits of industrial enterprises relate to the fiscal system, and to the management system of industrial and commercial concerns, and should be arranged in an over all way by a system so that foreign trade concerns will not have to be concerned them and can devote themselves singlemindedly to getting into the international market and giving a good account of themselves.

(5)

In actively participating in international division of labor, particularly in participating with a division of labor mostly with advanced industrial countries and the development with them of a trade relationship, will China's economic independence be hurt and China slide into a subordinate position? This is truly a question that should be seriously addressed.

International division of labor constitutes a tremendous system. It is something that was formed after capitalist production methods occupied a leading place worldwide, and particularly after the formation or imperialism. Within this system, developed capitalist countries occupy a "center" position, and backward undeveloped countries occupy a "peripheral" position to form a situation in which the "center" controls the "periphery," and the "periphery" is subordinate to the "center." It is as Engels long ago graphically described it: "The 'planets' revolving around the 'sun'."

Following World War II, the capitalist economically developed countries and the economically backward developing countries continued to maintain, in varying degrees, such a relationship of "center" and "periphery," control and subordination, in the international division of labor. Some so called "extroverted" developing countries penetrated the doors of transnational companies and used an expansion of exports as the locomotive in vigorous industrialization. Their economies had definite development and their production definitely grew, so that people exaggeratedly placed them in the ranks of the "medium developed nations," as though they had gone ahead of the developing countreis. However, some people saw behind this facade a hidden side, and pointed out that this was only a "subordinate development," and an "increased poverty." This latter view was in line with the facts.

However, to be suspicious of joining an international division of labor solely on the basis of this background and facts is not necessary either. Since all countries are tied together by a hundred and one economic links in this world, and since production consitions in each country take countless forms, each having advantages and each having disadvantages, inevitably a division of labor relationship and trade relationships came into being. The issue is not whether to become involved or not in these relationships, but to make these relationships benefit national economic development. Not only do they not harm economic independence; on the contrary, they can strengthen economic independence.

China is an independent, autonomous socialist country in which industry and agriculture are fairly well developed. This forms the foundation of our four modernization construction, and it also forms the foundation for our development of foreign trade. With this as a prerequisite and under the guidance of correct programs and policies, we have the conditions for hastening an increase in productivity and the speed of economic development through participation in an international division of labor. We have, at the same time, the conditions for guarding against any harm that might come about as a result of our use of correct policies. Therefore our active participation with developed countries in a division of labor positively cannot lead to a position of subordination in this division of labor. China's economic development positively will not lead to control by developed countries, and will not lead to serious impairment from developed nations' cyclical economic changes as was the case with some "extroverted" developing countries.

China has an internal market that is vast, and China's development of exports is not to make them a locomotive for vigorous industrial development, but rather as a principal source of external repayment capabilities.

Internal technical equipment is of fairly large scale and imported mechanical equipment does not constitute a motive power for equipping industry, but rather is primarily a means of promoting equipment renewal and technological improvements. Domestic raw and processed materials are relatively plentiful, so imported raw and processed materials are not the principal source for supplying industrial needs, but are rather channels for supplementing things in short supply.

Therefore, our active participation in an international division of labor does not mean dependence on an international division of labor; the expansion of exports does not mean dependence on exports; and increase in imports does not mean dependence on imports. This eliminates the possibility of turning into a "peripheral country."

Of course, China's economy is still very backward, particularly by every per capita indicator calculation, levels are extraordinarily low. However, in terms of mineral reserves, output of major industrial and agricultural products, total national output value, total national income, and such indicators, China is still in the forefront of the world. Our total energy is also fairly great. In a book titled, "Development of Dependence," written by Professor Yiwensi [phonetic] of Brown University and published in 1979 in the United States, China, the USSR, Japan, West Germany, France, and the United Kingdom were classed as the seven great "hub countries" of the world. Of course, this does not fit the facts; we have never been a "hub country," nor do we desire to be a "hub country." However, neither have we ever been in a position of being a "peripheral country," as all the world knows. Foreign scholars do not regard China as a "peripheral country," so we oursleves ought to be confident.

Therefore, our apprehensions about becoming subordinate as a result of active participation with developed countries in the division of labor are unnecessary.

FOREIGN TRADE

BRIEFS

GUANGDONG SPECIAL ECONOMIC ZONE--The Shenzhen special economic zone in Guangdong is vigorously developing. During the past 2 years, investments totaling 5 billion HK dollars have been made by foreign firms in the zone. The most rapid development is in real estate. New houses with a total floor space of 2.4 million square meters have been built. [Beijing Domestic Service in Mandarin 0400 GMT 30 Nov 81]

ECONOMIST DISCUSSES EMPLOYMENT PROBLEM

HK140650 Beijing ZHONGGUO XINWEN SHE in Chinese 0922 GMT 11 Dec 81

[Text] Beijing, 11 Dec (ZHONGGUO XINWEN SHE)--"Premier Zhao Ziyang pointed out in the government work report that it was necessary to 'actively develop the collective economy and the necessary individual economy of laborers and adopt various methods to place people awaiting employment in cities and towns into suitable jobs.' This is of the utmost importance. The employment problem is a serious economic problem in our country at present. It is, at the same time, a social problem. It affects social stability and unity. The development of a 'tertiary industry' could well be one major way of solving the employment problem." This was stated by Qian Jiaju, a member of the National CPPCC Committee and well-known economist, in an interview with a reporter of this news agency.

Qian Jiaju said: In America, people engaged in tertiary industry account for 70 percent of the employed. In Japan, they account for over a half. Obviously, our country cannot be compared with a developed capitalist country. However, there is a grave lack of service trades, something which can be felt by everyone. Take Beijing as an example. It is difficult to find a place to eat, have clothes made, get a haircut, take a bath and buy food, and there are also transportation difficulties. This is because there are not enough networks and points and also because of a serious shortage of shop employees and attendants. In the 20-odd years from 1957 to 1979, the population of Beijing proper rose by 45 percent, while commercial service points fell by over 74 percent. How could there not be problems? However, on the other hand, Beijing has a large number of youths awaiting employment who have nothing to do. It would be really great if we could solve [and] create employment by providing services.

Qian Jiaju said: According to statistics, if we were to restore the proportion of attendants in commerce and the catering industry in Beijing to the number of employed people to its 1957 level, we would need an increase of 100,000 people. If we were to restore this to its 1952 level, we would increase the number of people employed by 230,000. Further, the 1952 level was now even the highest level in history. In this way, we would be able to solve completely the problem of youths awaiting employment.

Qian Jiaju said: Recently, we have started to attach much importance to this problem. We have in recent years created numerous job opportunities and the collective and individual economies have also shown some signs of advancement.

However, results have not been that big. There were many reasons for this. The main one was that there were still some people who were afraid that, after the individual economy had been developed, we will go capitalist. This fear is truly groundless. With our country's socialist economy in such a strong position and heavy industry, light industry, commerce, banking, communications and transportation, motive power and raw materials all in the hands of the state, how could the collective and individual economies develop into capitalism?

Qian Jiaju was of the opinion that in order to develop the individual and collective economies, it is not enough to attach merely in principle importance to this problem. We must also adopt quite a few concrete measures. Hungary has adopted certain methods of rewarding small handicraftsmen which has livened up the Hungarian economy. These methods are worth studying. For instance, as far as free medical care, retirement schemes and other welfare benefits are concerned, people working in the individual economy or collective economy enjoy the same treatment as those working under the system of ownership by the whole people. Equal treatment is extended to them regarding assistance in constructing workshops, leasing equipment, providing favorable loans, supplying raw materials and so forth as if they were working under the system of ownership by the whole people. Qian Jiaju was of the opinion that if China could follow suit, the collective and individual economies could definitely be developed in a big way. In this way, not only could deficiencies in the state-run economy be made up, but basically the employment problem could also be solved.

BRIEFS

HENAN TRADE UNION MEETING--From 23 to 26 November, the Henan Provincial Federation of Trade Unions held the second enlarged meeting of its Eighth Committee. Yu Yichuan, secretary of the Provincial CCP Committee attended and spoke. The meeting called on all workers and staff members to learn from the revolutionary spirit of the Chinese women's volleyball team. The meeting urged doing a good job of the following tasks: 1) strengthening ideological and political work for the workers; 2) promoting democratic management of the enterprises; 3) promoting the masses' production and strengthening education for the model workers; 4) ensuring trade unions assist departments concerned to improve living and working conditions for the workers, and ensuring that 5) organization of the trade unions is promoted. [Zhengzhou Henan Provincial Service in Mandarin 1130 GMT 29 Nov 81]

HUNAN YOUNG WORKERS EDUCATION--The Eighth Hunan Provincial Federation of Trade Unions held an enlarged session of its Fourth Committee in mid-November. After listening to reports at the session, Wan Da, the second secretary of the Hunan Provincial CCP Committee stressed that the trade unions at all levels throughout the province must strengthen education for young workers. He said that half the working population of the province is comprised of young workers. Since these young people were all affected by the pernicious influences to varying degrees, we must teach them discipline and the legal system, and help them build a revolutionary outlook on life so that they can make more contributions to the four modernizations. In promoting education for young workers, Comrade Wan Da said that we must pay attention to the advanced as well as the backward. The trade unions must be resolute in helping the backward so that those who had gone astray will be put on the right track within 2 or 3 years. Comrade Wan Da said: We must be bold in correcting, educating and criticizing the backward young workers. Only then will we be able to overcome lax leadership over plants and enterprises. [HK031504 Changsha Hunan Provincial Service in Mandarin 1100 GMT 27 Nov 81] The meeting also adopted a resolution on the holding of the Ninth Provincial Congress of Trade Unions. The meeting elected (Peng Kui) a vice chairman of the Provincial Federation of Trade Unions. [Changsha Hunan Provincial Service in Mandarin 2310 GMT 29 Nov 81]

SHORT SUPPLY OF EVERYDAY ARTICLES NOTED

Shanghai JIEFANG RIBAO in Chinese 9 Aug 81 p 1

[Article by Jiang Liyang [3068 4409 2543], graduate student of the Journalism Department, Fudan University: "Look at This Survey, Think About the Needs of the Masses, the Problem of the Shortage of Everyday Commercial Commodities Needs To Be Solved Urgently"]

[Text] Recently, readers have written us to complain that many small everyday commercial commodities cannot be found on the market. Although these commercial products are small, they are very important. Without them, people's lives will be inconvenienced. This reporter has therefore surveyed 100 varieties of general merchandise, household supplies, handicrafts and art supplies to understand their supply situation:

Twenty-eight kinds are readily available: canvas belts, elastic cord, heavy thread, balls of thread, paper based plastic combs, food bags, iron needle hoops, zero size snap buttons, cotton yarn, mercerized yarn, backpacks, soles for cloth shoes, nylon net bags, cigarette holders, lighters, calcium carbide, organic hairpins, iron wire combs, buttons, bamboo beds, bamboo chairs, oil containers, single edge razors, sewing needles, knitted bags, iron locks, aluminum needles, plastic water bottle casings.

The supply of 32 other kinds of products can basically satisfy the demand: paper yarn, polyester fiber coils, folding paper fans, pant hooks, collar hooks, cleavers, scissors, sanitary belts, balls of silk thread, pocket knives, fingernail clippers, tool boxes, dressmaker shears, key chains (rings, clips), cigarette boxes, pins, wooden combs, combed winnowing fans, double edge razors, grass mats, palm leaf fans, soap, matches, closet handles, 8 watt desk lamp parts, hinges, dust pans, nylon lace, mosquito net hooks, sorghum brooms, handmade cotton towels, iron locks.

There are temporary shortages of 29 kinds of products: shoelaces, steel hairpins, tailor's chalk, elastic bands, bleached yarn, rib knittings, gauze, elastic cloth, flower lace, window screens, diapers, floss silk, silk ribbons, bristle brushes, schreinering bands, overlock threads, artificial silk embroidery threads, Suzhou lace, plastic flowers, horn combs, mosquito killing incense, large size children's shoes, reed catkin brooms, low-grade lacquer chopsticks, dual use toothpick containers, plastic water buckets, sponge soles, split rope for civilian use, inflatable toys.

Eleven kinds of products are not supplied: shoes for 1 year-old children, children's handkerchiefs, clothes washboards, chopping blocks, knitted children's shoes and children's hats, old women's hairpins, hydrogen balloons, oval chains, cradles, tambours, crepes.

It can be seen from this survey that there are temporary shortages or no supplies of 40 kinds of products. Some varieties are available sometimes but the needs of the people vary. Why has such a situation emerged? According to analysis by comrades of concerned departments of industry and commerce, previously, because of the influence of the leftist guiding ideology in economic work, some small commercial products were treated as products of "feudalism, capitalism, revisionism" and eliminated. Some effective production, supply and marketing methods were abolished as "tails of capitalism," and the shortage of small commercial products became very serious. In recent years, after bringing order out of chaos, the situation has basically changed. The varieties and specifications of small commercial products gradually increased. Take Yuyuan Market as an example, the amount of everyday small commercial commodities has increased onefold over that available during the 10 years of internal chaos. But, compared to the people's ever increasing need, the supply far from satisfies the needs. At present, to further develop the production of small daily commodities, the following practical problems urgently need to be solved:

1. Overcome Ideology of Emphasizing the Large and Neglecting the Small; Uniformly Arrange for Production

Small everyday commercial products are products not included in the production plans and have a low profit margin, the productive value is low, the profit is small. In economic readjustment and reorganization, because some enterprises place more value on products with a high productive value and high profits, small commercial products are often suppressed or squeezed out, and even cancelled. This is one reason for the shortage of small commercial products. One factory changed to manufacturing parts for electric fans last year during the "electric fan craze," and since then, the small commercial products that it originally produced have not been available on the market anymore. Another factory shifted raw material for the production of small commercial products to the production of products with a high productive value, thus the production of small commercial products declined in a straight line. To change this situation, the production departments should overcome the idea of emphasizing large products and neglecting small products; they should start out with concern for the people's needs and uniformly arrange production of small items. While producing everyday consumer products with a high productive value, which represent consumption trends, attention also should be paid to doing a good job of producing everyday commercial products. The large and the small must both be considered in readjusting the structure of products and in carrying out joint reorganization. The Qianjin Radio Components Plant originally produced oil containers for sewing machines, last year it was combined with the electronic tube manufacturing plant and after the product structure was readjusted, production of oil containers was given to a factory in Nanhui, thus maintaining the supply of this small commercial product. This spirit of being responsible for the needs in people's lives is worth promoting.

2. Improve Business Management, Dig Inwardly for Productive Potential

At present, there are many problems in the development of the production of small commercial items, for example, certain small commercial products cannot be priced according to quality nor priced according to the amount of materials and labor used, and some do not realize any profit; this affects the productive enthusiasm of the enterprises. How can this problem be solved? The Shanghai Yihua Glove Factory has provided a good experience. This factory was originally named the Shanghai Hardware Plant, it produced sheet iron rice strainers and funnels. Even though the price of raw materials rose again and again, the factory assured supply and thought of many ways to improve the method of material input, conserved expenditures, reduced cost, and thus maintained the production of sheet iron rice strainers and funnels and the profit. Because the production of small commercial products is mostly labor intensive, some enterprises have implemented the economic responsibility system and earned more for more labor. Because unified responsibility for profit and loss was changed to the bearing of profit and loss by the enterprises themselves, the worker's enthusiasm was elevated and an increase in production of small commercial products was promoted. The hidden potential within the enterprises is still great. Even the Shanghai Everyday Chemicals Factory that had already accepted financial subsidies from the state still actively improved business management, reduced cost, and during the first half of this year, it also increased the production of mosquito-repellant incense by over 60 cases. Of course, for individual small commercial products, the benefits of the producer and the consumer should both be taken into consideration to enliven the prices.

3. Help Should Be Provided in Many Ways, Productive Enthusiasm Should Be Mobilized

The development of small everyday commercial products not only must rely on the "self struggle" of the enterprises and improvement of business management, it also needs help in all aspects, and help should be given actively in tax revenue, profit, loan and raw material supply. For example, raw material supply is a problem. Small commercial products are mostly characterized as "third class commercial products, first class raw materials." At present, the demand for first class raw materials frequently cannot be satisfied. The shortage of certain sizes of shoe laces, elastic bands, red silk ribbons used for wrapping gifts in marriage ceremonies, and diapers, which the masses have complained about, all are related to the insufficient supply of the raw materials of cotton yarn, man-made silk and rubber fibers. A good housewife cannot cook without rice. The state already has established regulations and policies actively to help the production of small daily commercial commodities. Units producing small commercial commodities should receive reasonable economic treatment, raw materials should have normal supply channels.

Comrades of related industrial and commercial departments finally said, there are many problems in the supply, production and marketing of small commercial products that urgently need to be solved. The production of small commercial products also involves light industry, handicrafts, the textile industry, chemical engineering, and the electrical machinery industry. Therefore, it is hoped that this city can have a unified agency to coordinate the work in this respect to facilitate the development of and enliven the production of small everyday commercial products.

SCIENTIFIC EXHIBIT HIGHLIGHTS COMMERCIAL ACHIEVEMENTS

Shanghai JIEFANG RIBAO in Chinese 8 Aug 81 p 1

[Article: "Commercialization of Scientific Research Achievements, the City Holds Its First Chemical Engineering Technology Exchange Show, 130 Achievements Will Be Sold at the Show"]

[Text] A unique exchange exhibit of commercialized scientific research achievements--the Shanghai Chemical and Industrial Sciences Research Achievement Transfer and Exchange Exhibit will be held today at the Hongguang Middle School near the bund at Hankou Road.

In Shanghai, massive amounts of daily commodities and foods necessary to people's lives are being traded. In recent years, trade shows of production materials and equipment have emerged, but marketing of scientific and technological achievements is still in the first stages. To present this technological trade show well, the Municipal Chemical Industry Bureau yesterday afternoon held a preopening scientific research achievement transfer and exchange show. The research institutes of organic fluorine materials, petrochemicals, dyes and farm chemicals exchanged views on how to sell scientific research achievements. The Dafeng Chemical Plant introduced the benefits of purchasing scientific and technological products to facilitate each unit to do the preparatory work well and to participate in trading.

According to the responsible persons of the Scientific Research Department of the Chemical Industry Bureau, from the second half of the year before last to the end of last year, the Chemical Industry Bureau system's units have tried the transfer of 50 scientific and research achievements and obtained 740,000 yuan in transfer fees. There are about 130 scientific and technological items ready for transfer at this trade show. Among them, the "wave filler tower" developed by the Shanghai Chemical Engineering Research Academy was originally a kind of production equipment used in military and engineering production. Now it is ready for sale and its application popularized in the chemical industry. The new type of "ethylene acetate catalyst" developed by the Shanghai Petrochemical Research Institute is an indispensable catalyst in manufacturing polyvinyl alcohol fiber. Its international market price rises 50 percent every year. But its transfer fee is very cheap and the quality is as high as the imported product. The "burner" technology ready for sale by the Organic Fluorine Materials Research Institute can burn all kinds of toxic gases and will be greatly beneficial in improving environmental protection in Shanghai. In addition, the "X-ray blue film base resin" developed by the Shanghai Synthetic Resin Research Institute, the colored rubber shoe technology developed by the Shanghai Rubber Shoe Plant No 9, the "chrysanthemic ester insecticide" developed by the Shanghai Farm Chemical Research Institute are all domestically advanced scientific research achievements and are also ready for sale at the trade show.

Yesterday afternoon, the reporter joined the comrades participating in the trade show and visited its exhibition hall. The entire trade show is set up in 11 classrooms, each classroom is decorated and filled. According to statistics, those participating in this trade show total 30 units including companies of the chemical industry bureau system, research (academies) institutes, factories and universities and schools. They have used graphs, numbers and real objects and exhibited the scientific research achievements of their units, marked out the subjects they are willing to accept and at the same time they also are prepared to conduct technical consultation and technical services activities.

ZHAO WORD USAGE QUERIED--Beijing, 9 Dec--The well-known mathematician Gu Chaohao, a CPPCC member, has pointed out Premier Zhao Ziyang said in his government work report that China should strive to treble [fan liang fan: 5064 0357 3972] the total value of its industrial and agricultural output in 20 years; does this "trebling" mean increasing by 300 or by 400 percent? If 400 percent is meant, the figure will have to rise by an average 6.7 percent per year in the first 10 years and by 8 percent during the second 10. There are three different ways of interpreting this "trebling." Some hold that it means increasing by 100 percent, some by 200 percent, and others by 300 or 400 percent. It is necessary to wait for a clear answer from the quarters concerned. [Text] [HK100614 Hong Kong HSIAN WAN PAO in Chinese 9 Dec 81 p 4]

HENAN IMPROVES POSTAL SERVICE--(Gao Zhiming), director of the Henan Provincial Posts and Telecommunications Administrative Bureau, recently went to Weishi County and other counties to conduct investigation and study. He put forth specific suggestions on improving the distribution of newspapers and journals and postal service in rural areas. He demanded that all staff and workers on the posts and telecommunications front wholeheartedly serve the peasants. [HK101227 Zhengzhou Henan Provincial Service in Mandarin 1100 GMT 5 Dec 81]

HONG KONG BUSINESSMAN ANNOUNCES HIGHWAY PROJECT

HK150140 Hong Kong STANDARD in English 15 Dec 81 p 1

[Article by Chris Cheung]

[Excerpt] Beijing authorities have officially approved a Hong Kong-China super highway joint venture project linking Hong Kong, Guangzhou and Gongbei, which includes Macao, Hopewell Holdings Managing Director Gordon Wu announced yesterday.

Contracts to build the project are expected to be signed by two parties very shortly.

Construction of the 6-lane 240-kilometer highway, estimated to cost about HK$2.4 billion, is scheduled to commence early next year and be operational by the end of 1985.

Answering reporters' questions after a banking symposium at the Hong Kong Polytechnic, Mr Wu said the massive project secured the official nod from Chinese Premier Zhao Ziyang during the managing director's recent visit to China.

He said the highway will facilitate both passenger and cargo traffic when fully operational by 1986. Detailed road toll structure has yet to be worked out.

But according to preliminary rate structure, a single trip for an automobile will cost HK$80, and a 40-foot standard container cargo truck HK$400.

The highway will start in Lokmachau in the new territories, and go via Shenzhen, Taiping, Humen and Panyu where it will branch out into Guangzhou and Macao.

It will be linked by more than 200 bridges of various lengths.

Mr Wu said the company had talked with Chinese authorities on ways to simplify border checks and improve road conditions enabling the movement of massive cargo trucks.

He hoped both the Chinese and Hong Kong Governments could come to agreement on these matters soon.

Mr Wu said traveling time from Hong Kong to Guangzhou will be shortened to about 1 hour, and to Macao will take 1 and 1/2 hours.

All along the highway, there will be hotel accommodations, fuel stations, retail shops as well as first aid stands.

Mr Wu said it would be too early to estimate the capacity of the highway, but it will certainly be greater than the current 140-kilometer Hong Kong-China road network's 3,000 vehicle trips per day.

According to initial agreements, Hopewell is to shoulder the entire cost and China provide the land involved in the project.

Construction personnel and workers will be recruited in China but paid by Hopewell.

Mr Wu disclosed that the contract will include a 3-year term for highway operation starting from the year when it becomes fully operational.

During the first 10 years, income from road tolls will go to Hopewell.

And for the next 20 years, 75 percent of the income will go to China and the rest to Hopewell.

Mr Wu estimated that they would be able to recover the HK$2.4 billion cost plus interest in the first 10 years of operation.

Hopewell's idea for this project was initiated in 1978. But initial proposals met objections from the Chinese side in view of the vast use of agricultural land and the massive cost involved.

Hopewell's top management managed to jump over the hurdles through frequent contacts with Chinese authorities in the subsequent 2 years.

Mr Wu stressed there has been the need for a complete network in view of growing traffic and human movement between Hong Kong and China.

TITLE: "Seriously Reorganize and Reform Construction Industries"

SOURCE: Beijing JIANZHU [BUILDING CONSTRUCTION] in Chinese No 9, 30 Sep 81 pp 1-3

ABSTRACT: For a long time, under the influence of leftist ideology of economic work, basic construction plans vacillated constantly to impose upon the construction industries of Heilongjiang Province the following difficult problems: (1) Specialization and lack of balance among specialties; (2) Unreasonable distribution of projects to cause workers' livelihood to be insecure and the production technology weak; (3) Unreasonable system of materials supply; (4) Unreasonable accounting system; (5) Unreasonable business management. With these problems, each project took longer and longer, the cost was higher and higher, and the labor productivity lower and lower. The author proposes as solutions to these problems: (1) Organize a system of quality inspection for every aspect of a construction project; (2)Guaranteeing cost and quality through strict execution of contract; (3) Rectifying the business managing ideas of leaders, staff, and workers; (4) Reforming and reorganizing the structure of the construction industries. Detailed procedures and practices of these reform measures are illuminated.

TITLE: "Exert Efforts to Raise Comprehensive Economic Efficiency"

SOURCE: Beijing JIANZHU [BUILDING CONSTRUCTION] in Chinese No 9, 30 Sep 81 pp 4-6

ABSTRACT: In order to proceed with socialist construction, objective economic principles and laws of nature must be respected to use the least amount of labor to achieve the greatest economic result. This is the important experience gained from many years of practices and for it a very heavy price has been paid. Of the total basic construction investment of the nation, 60 percent is for building construction and every year the cost runs into billions of yuan. Projects of millions of m^2 of buildings of all types are finished every year. The economic efficiency of the building industries has, therefore, a very great effect on the entire national economy. In the 2 years of 1974 and 1976, the losses amounted to 50 percent and the state had to subsidize more than 440 million yuan. This is to say the building industries not only did not provide any accumulation for the state, they really lived off the state. Their profit has increased in recent years, however. In 1980, the profit per 100 yuan of investment had grown from 2.61 yuan of 1977 to 14.8 yuan. Projects are being completed faster and the quality of construction improved. Various means of further tightening the ideology and the system of economic responsibility to raise the economic efficiency of the building industries still higher are proposed by the author.

TITLE: "Several Problems in Raising Economic Efficiency of Building Construction"

SOURCE: Beijing JIANZHU [BUILDING CONSTRUCTION] in Chinese No 10,30 Oct 81, pp 3-7

ABSTRACT: In recent years, as the emphasis on quality is being popularized, various forms of the system of economic responsibility have also appeared. Liaoning Provincial Bureau of Construction and Handan Municipal Company No 2 have produced better results than most. Their experience proved that in implementing the system of economic responsibility, the interests of the state, the industry, and the individuals must be closely united. The aim must be to produce bigger gains for the state, bigger retained profits for the industry, and bigger income for the individuals. With the new situation, some new problems have also surfaced, involving the following: (1) There is a need to emphasize scientific management to handle the relationship between speed of work, quality, and cost correctly. (2) Suitable work arrangement for the old, the weak, and the women workers is of paramount importance. (3) There should be continuous efforts to overcome equalizationism. The system of economic responsibility means distribution according to labor. More work more pay and no work no pay with awards and penalties is the system to be resolutely and fearlessly executed. (4) Policies should be stable. For example, in some areas, the cost of construction had been set at a certain amount per m^2, but as the workers' income increased in a large scale, the industry hastily changed the policy

[continuation of JIANZHU No 10, 1981 pp 3-7]

to reduce the unit contract price. The aim of the industry was to increase its profit but the result was a loss of confidence among the workers. The author maintains that (1) The quality of a building is a many faceted thing. It includes the quality of design, the quality of structural members, and the quality of every aspect of the construction project. The key is the determination of the leaders to carry out a system of economic responsibility in every step and every aspect of the project to insure its overall quality. (2) Greedy for fat projects, unwilling to take on small ones, endless annoyance for customers due to poor building quality, endless postponement of completion date, demanding hard to obtain things under the threat of causing trouble, and accepting food, drinks, and other little favors are some among current problems to be dealt with so as to improve the reputation of the entire construction industry. (3) Work of political ideology should be carried in close connection with the economic work.

TITLE: "On the Seismic Stratigraphic Sequence, Lake Level Fluctuation and Oil Prospecting in the Qianjiang Depression"

SOURCE: Jiangling SHIYOU YU TIANRANQI DIZHI [OIL AND GAS GEOLOGY] in Chinese Vol 2 No 3, Sep 81 pp 276-283

TEXT OF ENGLISH ABSTRACT: This paper applies the method of seismic stratigraphy to divide the stratigraphic sequency of the Qianjiang depression and to map the periodic fluctuating curves of the old lake level. The following results have been obtained:

1. Two erosional surfaces have been discovered recently, one at the top of the Jingsha formation of Lower Tertiary, and the other at the top of the Yuyang formation of Cretaceous. The authors suggest that the exploration of oil and gas pools should be associated with these uncomformity planes.
2. Among the horizons of Lower Tertiary (the lower and upper parts of the fourth member, the third, second and first members in the Qianjiang formation; the fourth, first to third members in the Jinghezheng formation), we have found the relationship of onlap contacts. A new point has been suggested that some overlap unconformable stratigraphic oil and gas pools should be found in the northern part of

[Continuation of SHIYOU YU TIANRANQI DIZHI Vol 2 No 3, Sep 81 pp 276-283]

the Qianjiang depression.
3. With the correlation of periodic fluctuating curves of the lake level and the global Tertiary sea level, the Lower Tertiary in the Qianjiang depression has been further divided in age.

TITLE: "The Maturity of Organic Matter and Oil and Gas Potential of Taiyuan Formation in Northern Ordos Basin According to Their Vitrite Reflectivity"

SOURCE: Jiangling SHIYOU YU TIANRANQI DIZHI [OIL AND GAS GEOLOGY] in Chinese Vol 2 No 3, Sep 81 pp 284-291

TEXT OF ENGLISH ABSTRACT: This paper briefly clarifies the basic geological theories of vitrite reflectivity (R° max) and gives a preliminary discussion with R° max on the conditions of oil and gas origin in the Taiyuan formation of the Carboniferous System in the northern Ordos Basin. It is suggested that R° max ranging from 0.5 to 1.3 percent is confirmed as the main stage of oil formation; <0.5 percent as the immature stage; >1.3 percent as the overmature stage, that is, the gas formation stage. The results show that the organic matter of Otoc County and its southern region have reached the overmature stage; in its northern region, the Taiyuan formation is just at the main mature stage, but the conditions of conservation on both sides, east and west, are rather defective, with the available

[Continuation of SHIYOU YU TIANRANQI DIZHI Vol 2 No 3, Sep 81 pp 284-291]

region restricted to only a narrow zone in the southern part of the west. Finally, in combination with the geotectonic evolution, sedimentary characteristics and lithofacies of the basin, the districts of oil and gas potential of the Taiyuan formation have been divided.

ECONOMIC RESPONSIBILITY SYSTEM HELPS IMPROVE SERVICE TRADE

Jinan DAZHONG RIBAO in Chinese 21 Oct 81 p 1

[Article by Yang Shiyu [2254 0013 3768]: "Insure Service Quality by Two Link-ups and Four Considerations--Finance and Trade Enterprises in Jinan Continue To Improve the System of Economic Responsibility as an Impetus to Various Tasks"]

[Text] The finance and trade departments in Jinan Municipality have carefully summed up their experiences and continued to improve the system of economic responsibility by upholding the "Two Link-ups" and "Four Considerations" as a strong impetus to various tasks.

By the end of last year, the finance and trade departments in Jinan Municipality first experimented with the system of "responsibility for profit quota and sharing above-quota profits" as a system of economic responsibility in Meicun Restaurant which has sustained losses for years. The system produced good results, and soon changed losses into profits. At the beginning of this year, the same experiment was expanded to include five other similar restaurants, also with good economic results. Then the municipal financial commission summed up the experiences in the experiments and adopted the system of economic responsibility in various forms among the food, vegetables, nonstaple food and fruit trades and some change can now be notices among the enterprises which hitherto incurred losses or earned only meager profits. Some have turned losses into profits and others have increased their meager profits. Because of the one-sided stress on solutions to the problems of losses or meager profits at that time, and on the importance of economic indices, ideological and political work was neglected. Thus among some enterprises, the problems of reducing the varieties of commodities, selling the major portion to the peddlers [for higher profits], cheating on the weight, chiseling on the masses, a bias toward higher, but not lower prices, deteriorating quality of food, overcharging and other practices detrimental to the customers, appeared. On discovering this situation, the municipal financial commission immediately conducted its investigations and demanded the enforcement of "two link-ups" and "four considerations," meaning that the business operation should be linked up with economic results and service quality, and based on considerations of the interests of the state, the enterprise, the workers and the customers. In accordance with this demand, the enterprises once again readjusted the various indices used in their responsibility system, and treated the quality of service (including the implementation of the policies on prices and supplies, the appearance and sanitary conditions of the shops, the varieties of products and other forms of services) as an important criterion of evaluation in the responsibility system, and the quality of service generally should account for 50 percent of the total points. To insure the enforcement of "two link-ups" and "four considerations," the enterprises generally used three different methods: first, strengthening ideological and political education so that the broad masses of cadres and workers will be further convinced of the need to serve the people wholeheartedly, and to be responsible to the people. They should also be aware that this is the guiding principle for socialist finance and trade enterprises as well as the end-result of the economic responsibility system, and that pure pursuit of economic indices without regard for production and services to the people would be a deviation from the orientation of socialist business management. Second, supervision by customers. All shops should publicly display the commodity prices, the quality, standards, sanitary requirements, disciplines for people behind the counters, and their pledges of services; and accept mass supervision. Third, there should be strengthened control and inspection and a sound system of reward and punishment, so as to insure the fulfillment of various indices required for the responsibility system.

At present, more than 400 enterprises under the municipal finance and trade sector in Jinan have adopted the system of economic responsibility in various forms. All these units have shown improvement in their attitude toward work, and their business hours have been lengthened by 1 or 2 hours. The number of mobile service carts has been more than quadrupled, and they have succeeded in increasing the incomes of the state, the enterprises and the workers besides providing greater convenience to the broad masses.

PROBLEMS IN ADOPTING ECONOMIC RESPONSIBILITY SYSTEM IN ENTERPRISES REPORTED

Beijing CAIWU YU KUAIJI [FINANCE AND ACCOUNTING] in Chinese No 10, 20 Oct 81
pp 12-13

[Article by Li Youde [2621 2589 1795] of Tianshui Municipal Economic Commission, Gansu Province: "Several Problems in the Adoption of Internal Economic Responsibility System Among Enterprises"]

[Text] Adoption of the internal economic system among enterprises is a powerful measure for improving economic results and an effective way to arouse the enthusiasm of the broad masses of workers and staff members through the use of economic levers. It also paves the way for democratic management through a closer integration of rights, responsibilities, and interests.

I. Several Forms

At present, many industrial enterprises have tried out the economic responsibility system in their own workshops, work teams and work groups, as clearly shown in the changed forms of distribution. According to a preliminary investigation conducted by Tianshui Municipality, the internal responsibility system takes the following forms:

1) Piecework wages. The enterprises using this form are generally able to pay piecework wages to the work teams, work groups, or individual workers according to the nature of the products or the production order. The amount of piecework is calculated on either an individual or a collective basis, mainly for the purpose of linking remuneration with the fruits of labor according to the principle of more pay for more work. All work teams, work groups, and individual workers will share a common economic responsiblity. A rug plant, for example, pays for every square foot of rug at the second-level wage rate. This includes a certain subsidy for workers earning third- or fourth-level wages. The Brick and Tile Plant uses a collective piecwork wage system whereby each work team or work group is given a fixed number of workers together with fixed production quotas, fixed tasks, fixed quality, and fixed production costs. Internal circulation coupons are used for paying expenses. These coupons are issued at the beginning of each month, according to the production plan. When a settlement of accounts takes place at the end of the month, excess expenses will have to be covered by the coupons of the following month, but 40 percent of the savings [as shown by the unused coupons] will be given to the work teams or work groups as a bonus. The system of piecework wages directly

reflects the principle of "to each according to his work," and as long as the per unit wage is reasonable, theis system should produce good results.

2) Output quota and above-qouta piecework wages. The main idea behind this method is that after fulfilling the output quota at the basic wage rates, above-quota production will be paid for on a piecework basis, while failure to fulfill the quota will be punished by the deduction of a certain percentage of the basic wages. This method is being used by the leather shoe plants, hat factories, and garment factories. By increasing the responsibility of the workshops, it ensures the fulfillment of output and production cost plans, besides inducing the workshops, work teams, and work groups to be more concerned with production quotas and economic accounting.

3) Wages from the sharing of above-quota profits. This means setting profit quotas for workshops on the understanding that a portion of the above-quota profits will be shared by these workshops, and that failure to fulfill the quota will be punished through certain wage deductions. This is also a means of linking wages with economic results. Cutting tool plants and light industrial machinery plants, for example, are using the workshops as accounting units with their own income, expenditures, and profit quotas. These workshops will be given bonuses according to the profit rates. In adopting this method, we must note whether the set quotas are of an advanced nature, whether the shares are reasonable, and whether there is a basis for economic accounting; otherwise control will be difficult.

4) Piecework based on joint production, collective responsibility, and flexible value for workpoints. Some enterprises such as cement factories produce a single product, with various workshops working closely in a single production line resembling "a dragon." If accounting is carried out for the workshops separately according to their production of seminfinished products or the sequences of operation, each workshop may "go its own way" and create many contradictions which will make accounting difficult. Therefore, all the workshops and sections concerned are joined to form a single economic accounting unit, and the finished products of the plant are used as the criteria for the calculations. This joint production unit will be responsible for fulfilling the quotas according to the indices of production costs, quality, and consumption of raw materials and energy. This is called "joint production piecework and collective responsibility." Within the workshops, each job responsiblity carries a certain number of workpoints, and the value of each workpoint is flexible. A marked improvement has been noted since the experiment began in May.

5) Wages based on income-sharing. This method is suitable for the service trades, such as clock and watch repairs, bicycle repairs, processing garments and so forth, in which labor is directly related to income. One portion of the net income earned through labor is shared by the workers, while the other portion is used for management expenses and payment of tax, or is turned in as profit for the state. The ratio for dividing the income differs in different trades. The calculation can be based on the proceeds of the retail department or on the individual earnings. According to this method, individual income will be less if business is poor; the collective may also face deficits. When business is brisk and individual income is greatly increased, the situation may get out of hand, and there may be unequal advantages in certain trades. In some trades, for example, the average individual monthly income may be 170 yuan, but some individuals may get as much as 290 yuan while others may get only 30 yuan. The difference is too great.

II. Their Suitability

Each of the above methods has its special features and its suitability to a certain extent. Piecework wages and output quotas with above-quota piecework wages are suitable for enterprises in which the quantitites of products for each work team, work group, or individual can easily be calculated according to the production order. In other words, the output and quality can easily be determined, and the various indices can easily be controlled and verified. Wages from the sharing of above-quota profits are suitable for enterprises whose workshops can independently produce certain products or earn their income by offering labor services. After setting up production targets for the workshops, these workshops will be able to carry out their own accounting without involving one another. Joint-production piecework with flexible value for workpoints is suitable for enterprises producing a single product with a production line resembling "a dragon." Finally, wages based on income-sharing are suitable for the service trades.

Besides their special features, they all have one common feature because, despite their different forms, they require the same foundation characterized mainly by rational quotas, advanced management system, organized economic accounting, and basically regular production, supply, and marketing. If these methods are adopted mechanically without this foundation, the result will be the opposite, and there may be chaos in serious cases.

In adopting the system of economic responsibility, whatever form it takes, we must pay attention to its economic results and carefully handle the rational distribution of benefits to the state, the enterprise, and the workers. We must guard against overusing equipment, reducing quotas, resorting to fraudulent means, overlooking the need for good quality, and other unhealthy tendencies. We should also carefully carry out ideological work, strengthen the education of workers, and enforce a strict inspection system.

III. Result Analysis

All these forms stress responsibility for economic results, guarantees for the completion of the plants' tasks, and the strengthening of management--all in accordance with the principle of more pay for more work and distribution according to work, instead of "eating out of the common pot." Even an initial analysis can show the following advantages:

1) Integration of rights, responsibilities, and interests. For the workshops, work teams, and work groups of an enterprise, rights are the means, responsibilities are the tasks, and interests are the results. When there is a good result overall, individual interests will be assured. With the adoption of the internal system of economic responsibility, rights will be provided and responsibilities will be increased. However, interests must be obtained through subjective efforts in completing tasks and fulfilling duties. This means that everyone has a share in the burden, and a close relationship between the enterprise's economic results and the individual benefits will arouse the enthusiasm of the broad masses. In the first half of this year, 34 enterprises in the municipality fulfilled more than half their annual production plans; 70 percent of these enterprises had adopted the system of economic responsibility in various forms.

2. Good economic results. Among the enterprises that have adopted the internal system of economic responsibility, there has been a general improvement of economic results. In the case of the Brick and Tile Plant, the number of its personnel was reduced by more than 100 after the collective piecework system was adopted, and yet its output value and profits exceeded the planned figures by 16 percent and 70 percent, respectively. Its profits have doubled since the adoption of the piecework wage system. The rug plant also increased its productivity by 52.5 percent and raised its profits 1.6-fold.

3. Close integration of output, production costs and profit. Since fixed expenses amount to quite a large portion of the production costs of an enterprise, efforts must be made to increase output and reduce expenses in order to attain good economic results. From the way their payroll is worked out, workers will basically understand the relationships between output, production costs, and profits and the laws of economic results. They can then make their own calculations and endeavor to fulfill their tasks.

4) The integration of state, collective, and individual interests. The system of economic responsibility has brought about a close relationship between individual income, output, and profit. Since the amount of individual income is determined by the value created by labor, the interests of all three parties should become organically integrated. A hat factory, for example, produced 207,000 hats above its production quota in 1980, and above-quota piecework wages were increased by 15 percent, and the increased portion of wages amounted to 32 percent of the increased portion of taxes. Thus the state received more revenue, the enterprise retained more profits, and the individuals made more income.

IV. Problems To Be Studied

The system of economic responsibility, which aptly embodies the principle of "to each according to his work," helps arouse individual enthusiasm. In some units, however, the backwardness of ideological and political work, the low level of enterprise management, and irrational quotas usually leave certain loopholes and create adverse effects.

1) When the workshops, work teams, and work groups have earned above-quota profits and individual income is raised, profits for the enterprise are as a rule not realized. The enterprise has to sell its products in order to make a profit, while the workshops, work teams, work groups, and individuals can obtain above-quota wages provided they overfulfill the output quotas and the targets of production costs and profits every month. Should there be stagnation in the circulation of goods as a result of changes in market conditions, a situation may result whereby the individuals get increased benefits while the enterprise gets no benefits or even suffers a loss. A way to solve this problem should be carefully studied.

2) Excessive use of the equipment in striving for increased output. For example, the overloading of vehicles and equipment and the disrepair of equipment in some plants have caused great concern. Therefore, it is imperative that the indices of equipment maintenance and wear and tear be included in the responsibility system. There should be meticulous inspections together with a system of rewards and punishments.

3) Need for ideological and political work to direct the workers' enthusiasm onto the right path and to guard against "looking toward money." This is an urgent problem. On hearing about the practice of an economic responsibility system, some workers of a unit may say: "Let me undertake the responsibility for trucks so that all the above-quota profits will belong to me." Workers or small collectives may try every way, even crooked ways, to increase their gains. That is why ideological and political work along with the perfecting of various systems, and particularly the strengthening of quota management, are the basic guarantees for the healthy development of the system of economic responsibility.

INSTITUTIONALIZATION OF AUDITING SYSTEM PROPOSED

Beijing CAIWU YU KUAIJI [FINANCE AND ACCOUNTING] in Chinese No 8, 20 Aug 81 pp 28-29

[Article by Yao Meiyan [1202 2734 3508]: "Proposal for the Establishment of Auditing Organs"]

[Text] In the work of accounting, one of the urgent problems at present is that of supervision. Supervision over accounting can be exercised either beforehand or afterward. Auditing, based on accounting data, is a form of supervision exercised afterward over economic activities as well as revenues and expenditures. To strengthen auditing, it is necessary to set up corresponding organs. This article will attempt to present some views on the question of establishing auditing organs.

I. Historical Review

We have experienced setbacks in the matter of auditing. During the First Five-Year Plan, auditing was fairly highly regarded, and auditing groups (or inspection groups) were formed in many enterprises and in the financial departments of many units. These groups were especially engaged in the work of auditing, including making regular checks on vouchers, statements of accounts, and other accounting materials, and they played an important supervisory role in enforcing financial and economic regulations and discipline, in practicing economy, and in opposing extravagance, waste, corruption, and embezzlement. Departments in charge and financial and banking departments could generally audit the accounts of the basic-levels units. Therefore, the data provided by accounting was fairly realistic and complete, and the work of accounting was good and orderly.

In 1958, there was a tendency to discard auditing, and some auditing groups which had functioned effectively for many years were abolished. Three mistaken ideas then gained currency: One of them was that under the socialist system, people with a high political consciousness should willingly protect the state's financial instituions and observe financial and economic laws; that extravagance and misappropriation of state property could only be isolated cases; and, therefore, that no auditing was necessary. Another mistaken idea was that socialist accounting is better than capitalist accounting because it supplies only reliable accounting data and does not permit, nor is there any need to supply, incorrect data; therefore, there was no need for regular auditing. Still another mistaken idea was that auditing was learned from foreign countries, that it was capitalist, and that it should be repudiated, and so forth. Because of these mistaken ideas, many units abolished their auditing organs, and even the Finance and Economics College deleted "auditing" from its curriculum. Since there was no regular auditing, people had to wait until problems piled up and then shart a checkup in the form of a violent class struggle. The accountants who were in charge of money and supplies had to bear the brunt. Because of the great risks involved, nobody was willing to work as an accountant.

The mistake of rejecting the need for audits was later pushed to extremes by Lin Biao and the "gang of four." In units where they had usurped leadership, only "service" was permitted, and there was actually no auditing to speak of. The so-called "service" was no more than a green light for these people to indulge in extravagance, waste, corruption, and embezzlement. Practice is the sole criterion for testing truth, and a host of facts have shown that it would be impossible to do without auditing. We are of the opinion that as long as feudal and capitalist concepts remain, as long as conflicts of material interest exist among people, and as long as class struggle has not finally ended, the work of auditing is indispensable in all spheres of economic life. To accelerate the four modernizations, we must greatly strengthen the work of auditing and bring it into full play.

II. How To Strengthen the Work of Auditing

Auditing now takes three forms: 1) Auditing by accounting personnel in basic-level units; 2) auditing of affiliated units by departments in charge; and 3) auditing by financial departments, banks, and taxation departments among their affiliated units. All these forms have played a certain positive role. However, in the absence of auditing organs in basic-level units, no one is held particularly responsible for the checking of vouchers and statements of account, and the work of auditing is being carried out in a haphazard manner. Without special auditing organs and personnel, financial and banking departments similarly have difficulty conducting comprehensive audits into the accounts of basic-level units. Thus it is hard to give full play to the role of auditing. We believe that it now is necessary to restore the system of the 1950's by forming auditing groups in the basic-level units, to be staffed with adequate personnel, for audit work. Corresponding auditing sections in the departments in charge should also be set up to be responsible for auditing the accounts of their affiliated units. To strengthen the work of auditing, the departments in charge can organize their affiliated units for "mutual auditing" as a supplement for "self-auditing."

Besides setting up auditing organs in basic-level units or departments in charge, there is still another question to be considered. If the auditing organs in basic-level units or departments in charge should discover any fraud, corruption, or deception committed against the state, and know that such acts are condoned by the leadership of the units concerned or even by higher authorities, it would be a difficult problem for them to solve. Furthermore, there is also the question of who is qualified to investigate violations of financial and economic law that are committed by the provincial, municipal, or even central level. The present method is for serious cases--such as the illegal building of mansions in Luda Municipality and the violation of financial and economic laws in Zhumadian--to be dealt with by the Central Commission for Inspection of Discipline, or by people especially organized for the purpose by the departments in charge under the State Council. There is nothing wrong with such forms of action, but from a legal point of view it would be better to have permanent and authoritative auditing organs doing such work. Furthermore, because of the special positions occupied by the units at the provincial, municipal, or central levels, any mishandling may bring serious damage to the state. Therefore, the establishment of an independent and powerful auditing organ to supervise all national economic activity is a necessity. In my opinion, a good way is to set up a state auditing bureau under the Standing Committee of the National People's Congress. As everyone knows, the NPC is the supreme organ in our country, and when it is not in session, its Standing Committee performs the NPC functions. Therefore, a state auditing bureau, established under the NPC Standing Committee, would have the authority to supervise the economic activities and accounts of all units. The state auditing bureau would be the supreme auditing organ, and provincial, municipal, and autonomous regional auditing bureaus could be set under the standing committees of the provincial, municipal, and regional people's congresses to be responsible for the work of auditing in the affiliated departments in charge and in the basic-level units.

Way back in 1954, Premier Zhou Enlai said in his Report on the Work of the Government, delivered at the First National People's Congress: "Both the National People's Congress and people's congresses at the various local levels have the right and responsibility to supervise our national revenues and expenditures. We hope the representatives of those supervising the government's work will cooperate with the government personnel concerned in opposing waste, unwieldy organizations, disregard for financial institutions, lack of concern for state property, and lack of efforts in practicing economy and increasing the accumulation of funds; and in opposing tax evasion and embezzlement of government funds." Here, Premier Zhou clearly pointed out the rights and responsibilities of the NPC for supervision, and gave us a detailed blueprint of the way to enforce this supervision. Now is the time to carry out Premier Zhou's behest.

Many foreign countries have established permanent auditing organs, such as the social accounting organ of Yugoslavia, the accounting tribunal of France, and the audit bureau of West Germany. They are all independent organs with enormous power, and their officials and workers, once assigned by the government, cannot be dismissed or transferred at will. These are favorable conditions for the work of auditing and can be used by us as reference.

There are five basic tasks for the state auditing bureau as initially envisaged:

1) To check vouchers, accounts, and reports and see whether they are genuine, complete, and consistent with realities, and whether there is any fraud or cheating on the government.

2) To check various economic transactions and see whether they correspond to the principles, policies, rules and regulations, plans, and budget stipulations of the party and the state; and to see whether there is any violation of financial and economic laws.

3) To check and see if there are acts of extravagance, waste, corruption, or embezzlement.

4) To check on the finance and accounting departments and see if they are functioning in accordance with the finance and accounting system, and to see if the accountants are performing their duties and exercising their rights properly.

5) To take action against those units and individuals that violate financial and economic laws, to the detriment of the interests of the state. Such action should be decided on after due inspection and verification.

The state auditing bureau's task is an important one, and the strengthening of accounting supervision and economic management is of great significance. Therefore, the establishment of a state auditing bureau is an urgent task.

III. Advantages of Establishing an Auditing Bureau, and Its Relationship With Other Froms of Auditing

There are many advantages in establishing an audit bureau. Free from the control of any administrative department, it can conscientiously proceed with the performance of its duties without further worry. It will be free to act according to rules and regulations, enforce the law vigorously, and do anything that should be done without fear or worry. This will help prevent retaliatory acts against accountants who uphold principles and perform their duties faithfully. With the establishment of a permanent organ, it will be possible to carry out regular inspections of the accounting data of various units and to help accountants improve their work and raise their professional level. It will also help supply more realistic and complete accounting data. Regular aduiting will keep us well informed of the way in which various units are implementing state principles and policies and observing the financial and economic laws, and will help us detect problems and solve them promptly in order to protect socialist property. At the same time, it can prevent a repitition of the old practice of mass auditing movements instead of regular inspections. This will help raise the morale of the accountants.

After a state auditing bureau is established, will auditing by basic-level units, departments in charge, and financial and banking departments still be necessary? From what has been said, the answer is definitely "yes." It is only because of the inadequacy of auditing by basic-level units, departments in charge, and financial and banking departments that the establishment of a state auditing bureau is required. Instead of replacing the other forms of auditing, the state auditing bureau's function will be to guide and assist them so that they can work more efficiently. They are all linked together, but each has his own job according to the division of work. The state auditing bureau will be responsible mainly for auditing in units at or above the provincial, municipal, and autonomous regional levels, in addition to certain basic-level units; while local departments in charge and financial and banking departments should carry out all-round auditing and be solely responsible for those accounts audited by them.

Furthermore, in order to ensure the smooth operation of the auditing bureau, the state should formulate "auditing laws" (or "laws of accounting superivision") clearly specifying the forms of organizations and the tasks, features, and methods of auditing. To meet the requirements of the auditing organs that are to be set up, the Finance and Economics College should add "auditing" to its curriculum in order to train students in auditing knowledge.

Since the establishment of an auditing bureau will be an innovation, the views here presented are still immature. I hope everyone will further study and discuss this matter and pool all resources so as to contribute to the strengthening of the work of auditing.

FINANCE AND BANKING

STATE-RUN ENTERPRISES INCOME DISTRIBUTION SYSTEM DISCUSSED

Beijing ZHONGGUO CAIMAO BAO in Chinese 20 Oct 81 p 3

[Article by Wang Chengyao [3769 6134 1031]: "Question of Two Forms of Payment—Taxes and Turned-in Profits--by State-run Enterprises Discussed"]

[Text] For the distribtuion of net profits of state-run enterprises, should both forms--taxes and turned-in profits--or only one of them be used? There have always been different views on this question. For a very long time, many comrades have held that only one of them should be sufficient. In recent years, stress was laid on the need to observe economic laws and to manage the economy through the use of economic levers and other economic means. For this reason, taxation as an important economic lever in regulating production, distribution, circulation and consumption, is now receiving increasing attention. To give full play to the role of taxation as an economic lever, the question of whether taxes should be used as the only form of payment in the manner of "changing profits [to be turned-in] into taxes" or "substituting taxes for profits: and whether both taxes and profits should be used for the same purpose has become the focus of attention in restructuring the system of income distribution among state-run enterprises. Recently, the China Finance Academy and the departments concerned jointly held a meeting to study the reform of the taxation system and the financial system of enterprises, and a special discussion was conducted on this question.

The comrades attending the meeting generally held that in view of the present economic situation, the use of both taxes and turned-in profits by state-run enterprises should be continued for some time as a means of state revenues. Yet these comrades stressed different factors in support of their views. Some of them stressed the important role of turned-in profits and profit retention as economic levers, and held that at any time, the use of taxes and turned-in profits should be well coordinated.. Others stressed "substitution of taxes for profits, independent accounting, and responsibility for profits and losses" as an important reform in the distribution of the incomes of state-run enterprises; and held that since conditions are not yet ready for all-out efforts to be made in this direction, we can only conduct experiments in small state-run enterprises and a small number of large or medium-size enterprises, and then gradually popularize the method after gaining experience.

As an orientation of restructuring in the system of distributing enterprise incomes from a long-range view, should we use taxes as the only form of distribution or continue to use both taxes and turned-in profits? There were three different points of view on this question during the discussion.

First, let us look at taxes as the only form of distribution. It was held that "substituting taxes for turned-in profits" or "changing profits into taxes" (including charges for the possession and use of state funds) was far superior to profit-sharing, and should be the orientation of restructuring, for the following reasons: (1) In view of the complex social economic conditions, there should be adjustments in various aspects, including the vertical adjustments in the national economy (meaning the adjustments within the system of ownership by the whole people) and the horizontal adjustments (meaning the adjustments among different departments, enterprises and various products). Only thus can there be a rational economic structure, a rational product mix and a rational pattern of organization for the enterprises; only thus can the relationship of interests among the state, the enterprise and the workers be properly handled. Through taxation in various forms and repeated adjustments and modifications, it will be possible to adapt measures to the complex economic conditions in various aspects; to provide guidance in production and consumption; and properly to streamline various relationships. Profit, however, is a comprehensive economic index, and the turning in and retention of profits as a single form cannot solve the problem of complex economic activities. (2) To arouse the enthusiasm of state-run enterprises, it is necessary to provide the enterprises with certain decision-making power along with the guidance of state planning and state leadership, so that the enterprises can within certain limits assume responsibility for profits and losses; and so that their rights, responsibilities and interests can be closely integrated. If the way of distributing incomes is established through taxation and tax legislation, it will help serve this purpose by carrying out effectively the two "three-in-one combinations," namely, the combination of the interests of the state, the enterprise and the workers, and the combination of the enterprise's rights, responsibilities and interests. The use of taxation as a means of adjustment will not only solve the problem of unequal advantages caused by objective factors among different enterprises, but also preserve rational interest differentials among the enterprises. The method of profit-sharing cannot be free from departmental and regional restrictions. Furthermore, there must be profits before any sharing is possible. If there are no profits to be shared and the state has to subsidize the loss, then close coordination among rights, responsibilities and interests will be impossible. (3) If taxes are levied according to law and the amounts to be levied are calculated at given rates, there will be a distinct relationship between the state and the enterprise in the distribution of income, and the adjustment of rights and interests will be protected by law. This will insure timely, steady and reliable state revenues. (4) If taxes are levied in various forms along with various adjustments, the effects of taxation can be felt in production and marketing activities, in cost accounting, in the distribution and use of profits and other aspects of the enterprise's operation. Therefore, compared with profit-sharing, this can play a more effective supervisory role. (5) We have not yet seen enough of the experiment of "substituting taxes for profits" or "changing profits into taxes." However, as long as we proceed with the restructuring by breaking down the old conventions, the problems can be basically solved.

Second, a look at the use of both taxes and profit-sharing. It was held that since, from the long-range view, turning in profits and paying taxes play basically equal roles in state revenue, profits cannot be replaced by taxes for the following reasons: (1) Profits belong to the owner of the means of production, and the state is the owner of the means of production in the state-run enterprises. Abolition of the profits to be turned in will actually mean that the state has abandoned its rights of ownership of the means of production in state-run enterprises. (2) State-run enterprises are built on the foundation of the system of socialist public ownership, and stand for planned commodity economy; and the issuance of funds, the layout and orientation of production, the product mix, the material structure, labor management and so forth are mostly regulated by state planning. The responsibility for profits and losses resulting from labor consumption--either higher or lower than average socially necessary labor time--should not be entirely borne by the enterprise. Some enterprises are only making meager profits or even suffering losses because of certain government restrictions or objective factors; in this case, the loss should be borne by the state and the enterprise should no longer assume responsibility for its own profits and losses. Therefore, the method of "substituting taxes for profits and assuming responsibility for profits and losses" is not entirely appropriate. (3) In levying income tax, the rax rates should be established so that higher taxes will be levied on higher profits; lower taxes for lower profits; and no tax for loss. This method lacks flexibility. On the other hand, profit-sharing can be based on changing conditions and adapted to the enterprise's plan for readjustment. Thus it can help regulate the enterprise's retained profits and induce those enterprises incurring losses to reduce their losses and thus share the savings. This method is more flexible in handling various relationships. (4) The levy of income tax is based on the profits realized by the enterprise regardless of the actual conditions for fulfilling various planned quotas. Profit-sharing, however, is closely related to these conditions. An enterprise can share the profits only when it has fulfilled the various planned quotas, and the size of its share is not determined by any single quota of profit. Therefore, profit-sharing is an important lever serving to encourage state-run enterprises to fulfill all the planned quotas and to insure the realization of planned economy. (5) As long as the present method of profit-sharing is improved--by such methods as the replacement of basic-level enterprises by trades or companies, as units for profit-sharing and profit-retention, so that these trades and companies can work out suitable overall arrangements for profit-retention by their affiliated basic-level enterprises--the present problems of duplicated construction projects and unequal advantages among the enterprises will be solved. (6) In view of the present difficulties for drastic price changes and before the tax rate for products is readjusted, it is impossible to adopt the system of progressive taxation. The method of "changing profits into taxes" is thus essentially a form of profit-sharing without much newly added substance or any special significance.

Third, taxation as the main form of distribution is to be supplemented under certain conditions by profit-sharing. It was held that the ratio of taxes in state revenues should be raised a great deal, say, as high as about 80 percent. Under ordinary conditions, only taxation will plan the regulative role; but under certain extraordinary conditions, profit-sharing should still be used and there should be no "arbitrary uniformity." Apart from the five reasons for the use of taxation as the form of distribution, according to the first point of view, there are the following three supplementary reasons: (1) Because of the complex economic conditions and the numerous differences in the levels of technology, material resources, and equipment in different enterprises; the deviation of prices from value over a long period of time; and many other reasons, differences in the profit levels of different enterprises are inevitable. Therefore, taxation can play its regulative role under only ordinary, and not all, conditions. Under a unified taxation system, there are always some enterprises whose after-tax profits are more than what they actually need; and it is impossible to work out a tax rate for each enterprise for the purpose of absorbing their excess profits. (2) Taxation and profit-sharing are both economic levers but playing different roles. Since we advocate the full use of all kinds of economic levers, we cannot discard profit-sharing which is still effective as an economic lever and is readily available. In the past, there were requests for "substituting profits for taxes" and the "combination of taxes and profits"; now there is the request for the complete substitution of taxes for profits and the abolition of profit-sharing. The view that taxes and profits are two irreconcilable forms of payment is not a scientific one. (3) The regulatory income tax, as an important aspect of "substituting taxes for profits" can only exist as a temporary expedient in the experiment of restructuring during the readjustment of the national economy, but should not be adopted as a permanent measure. Since its source is not clear, and in the absence of any clear indication of its nature as either tax or profit, the regulatory income tax lacks a theoretical basis; and in levying this tax, it is very difficult to determine the subjective or objective causes of higher profits. Therefore, it offers no encouragement to the advanced units. Furthermore, because of the different levels of profits among the enterprises, it will be difficult to introduce a unified legislation.

SHANGHAI'S CONSTRUCTION BANK INVESTMENTS PRODUCE GOOD RESULTS

Shanghai WENHUI BAO in Chinese 27 Oct 81 p 1

[Article by correspondents Shen Jiqing [3088 0679 1987]: "Every Yuan of Bank Loan Helped Produce 3 Yuan Profit for Industrial Plants--Shanghai's Construction Bank Stresses Economic Results in Handling Finance"]

[Text] In 1 year, the investment of each yuan has brought 3.6 yuan of tax or profits for the state. Such has been the result of investment by Shanghai's construction bank in 25 medium-size projects.

These 25 projects were mostly related to equipment renovation and technical transformation in the light, textile and chemical industrial sectors. The average investment in each project was less than 500,000 yuan, and the smallest one costed only a few tens of thousands of yuan. Before granting the loans, the bank conducted intensive feasibility studies and paid attention to the role of the productive capacity in filling certain gaps and in comprehensive utilization. Therefore, these projects required fairly short construction periods--generally 10 months--and yielded remarkable economic results. Each year, they are able to increase state taxes and profits by 38 million yuan and earn 6.64 million yuan in foreign exchange. The total profits were 3.06 times the amount of bank loans.

The Shanghai Flour Mill is an old enterprise, using out-dated equipment with low efficiency. In the past several years, the flour processing task of this mill became increasingly heavy, and equipment replacement was necessary for raising its productivity. Before granting a loan, the municipal construction bank conducted many feasibility studies in collaboration with the financial departments and found no need for the additional mills to be built with indigenous methods, since such equipment could be bought and the technical force was available. The bank quickly approved a loan of 600,000 yuan for this mill, and this amount, together with an allocation by the bureau in charge, enabled the mill to replace 37 mills. This project began last May and was ready for operation by August. The productive capacity was doubled and the annual profits increased by more than 2 million yuan.

The dacron cord produced by the China Feilun Cord Factory is selling well at home and abroad. Last year, this factory wanted to renovate a dryer in order to increase its drying capacity in the production line. However, the cone winder was not fast enough for the dryer which had acquired increased drying strength, and the productive capacity could not be balanced. In view of this, the municipal construction bank granted a loan of 48,000 yuan for the factory to buy 8 additional sets of cone winders to even up the productive capacity. By this means, the factory increased the output of cord by 6,500 dozen spools each month; increased its profits by 936,000 yuan each year; and earned $480,000 in foreign exchange. The loan was totally redeemed in 1 month.

The municipal construction bank is keenly interested in comprehensive utilization. In the past, the residual gas from the sulphuric acid workshop of Wujing Chemical-Industrial Plant was recovered to be made into liquid ammonium sulphate to be used as fertilizers. Sales of this type of fertilizer were poor in recent years because of its low efficiency. Besides incurring a loss of 600,000 yuan each year, the plant also created serious problems of pollution. Last March, the municipal construction bank conducted investigations and then loaned this plant 280,000 yuan for technical transformation. The residual gas was then made into ammonium bisulfite to be used by the Shanghai Sulphuric Acid Plant. Because the work was carried out according to plan, the project was completed for operation in 2 months, and the loss was turned into profit. The loan was repaid, and with interest, in 5 months. The Wujing Chemical-Industrial Plant now can increase its profits by 360,000 yuan each year, and the Shanghai Sulphuric Acid Plant also can increase its output value by 1.35 million yuan each year.

'JINGJI GUANLI' ON ZHEJIANG INDUSTRIAL GROWTH

HK190612 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 11, 15 Nov 81 pp 3-6

[Article by Jin Ji [6855 4764] and Tong Tai [4547 3141]: "How Did Zhejiang Province Maintain a Fixed Industrial Growth Rate During Readjustment?"--passages within slantlines denote boldface]

[Text] Since the implementation of the policy of readjusting the national economy our province's industry has continued to grow. The total industrial output value of the province in 1979 was 17.9 percent more than that in the previous year, that in 1980 was 27.5 higher than in the preceding year and that in the January-August period this year saw an increase of 14.5 percent over the same period last year.

The Major Characteristics of Industrial Development Over the Past 3 Years

1. Top priority has been given to light industry and heavy industry has also grown to some extent.

The output value of the province's light industry constituted 60 percent of the total value of all industrial output of the province during the readjustment period. The total value of light industrial output in 1979 increased by 17.1 percent over the previous year, that in 1980 was 30.4 percent more than that of the preceding year and that in the January-August period this year was 21.2 percent higher than in the corresponding period last year. Heavy industry has also grown to some extent during the period of readjustment. The total value of heavy industrial output in 1979 increased by 19.1 percent over the previous year, that in 1980 was 30.4 percent more than that of the preceding year and that in the January-August period this year was 4.5 percent higher than in the corresponding period last year. The development of light and heavy industries has been coordinated and the industrial structure has become increasingly rational.

2. The industry under the system of collective ownership has developed at a relatively fast pace.

The output value of industry under the system of collective ownership (including the enterprises run by the Provincial Second Light Industrial Department, the neighborhoods of towns and communes) accounts for 40 percent of the total industrial output value of the whole province. During the period of readjustment, the speed of development in collective industry continues to increase. The total output value of collective industry in 1979 was 19.9 percent more than that of the previous year. The collective industry of small cities and towns increased by 17.6 percent and collective industry run by communes saw an increase of 26.3 percent. The total output value of collective industry in 1980 was 39.3 percent more than that of the preceding year. The collective industry of the small cities and towns increased by 34.5 percent and collective industry run by communes saw an increase of 51.8 percent. The total output value of collective industry in the January-August period this year was 25.5 percent higher than in the same period last year. The collective industry of the small cities and towns increased by 17.6 percent and collective industry run by communes saw an increase of 46 percent.

3. The economic effect has been raised to some extent.

Over the past 3 years the technical and economic targets of industrial production have been fulfilled in a relatively satisfactory way, and marked achievements have been made in economizing on energy. The overall consumption of energy for every 10,000 yuan's worth of output value in 1980 was 57,300 tons [as published], a decrease of 8 percent compared with that in 1979. The industrial production in the January-August period this year continued to rise and the amount of energy consumed throughout the province has by and large not increased. The profit achieved in 1979 by those industrial enterprises under the system of ownership by the whole people, which practiced independent business accounting increased by 20 percent over the previous year. That in 1980 showed a 24.5 increase over the preceding year and that in the January-August period this year was 1.5 percent more than that in the corresponding period last year, calculated according to comparable prices in that year.

During the Readjustment Period, Accelerate the Development of Industry

The reasons we could maintain a certain speed of development in the province's industry were mainly that the CCP Provincial Committee and people's government strengthened leadership over the economic work; proceeded from the reality of the province; defined the policies for developing industry; had a relatively firm hold of economic organizational work; adjusted and coordinated the work of various departments; readjusted and rectified the leading bodies of a great number of key enterprises; adopted a series of policies and measures advantageous to the development of industrial production within the limits permitted by the relevant state regulations to revitalize the economy and began to reform the industrial structure and product mix. Concrete examples are listed below:

1. In accordance with the "provincial condition," change the guidelines for industrial development and bring into play the strong points of light and textile industries.

In 1978 the leadership of the CCP Provincial Committee and people's government put forward the matter of it being imperative to earnestly sum up the experiences and lessons of economic construction and pay attention to giving full scope to the economic strong points of the province. It was regarded at that time that Zhejiang Province's economic strong points were the diversified rural economy and light, textile and silk industries and its weak points were serious shortages of coal and iron deposits and it was stressed that it was necessary to develop advantages and make the best use of advantages to overcome shortcomings. After the 3d plenary session of the 11th CCP Central Committee, in the process of studying economic readjustment and long-term planning, we further summed up the experiences and lessons of the province's economic construction and analyzed the "provincial condition" of Zhejiang Province. On this basis we hold that the main economic characteristics of the province are shown by the fact that the province has always been called "a land of fish and rice, home of silk, a place with advantageous resources of mountains and seas (there is enormous potential in mountain areas and fishing zones), a land of tourism and a place of cultural relics (the former scientific and technological as well as education foundation was relatively sound)." Other major characteristics are that agriculture and light industry occupy a large proportion in the national economy of the province; the output value of heavy industry constitutes 27 percent in the total value of agricultural and industrial output and most of the products of heavy industry serve agriculture and light industry; medium and small-scale factories are numerous among the industrial enterprises, the collectively-run enterprises form a large proportion of all enterprises and labor-intensive enterprises form the main part of these; in circulation, most of the agricultural and sideline products and light and textile industrial products (which use agricultural and sideline products as raw materials) are for export and allocation to other provinces and we depend on importing most of the fuel and much of the raw materials for heavy industry and the chemical industry from other provinces. We have come to see that one of the important problems in our past industrial production was that we marked time by building an independent industrial system and adopting the principle of "taking steel as the key link," spent large quantities of financial and material resources to obstinately remedy weaknesses, preserved disadvantages by discarding advantages and squeezed out agriculture and light industry, thus affecting the growth rate of the national economy. Through analyzing the "provincial condition" and summing up experience in this way, we have realized that we must no longer waver in regard to the relationship between heavy industry, agriculture and light industry and still less can we disregard the expenses in solving the problem of "goods whose supply has fallen short of demand" because of the lack of resources. We have clearly understood that it is necessary to put light and textile industries in a priority position, go all out to develop a diversified economy in agriculture, provide light and textile industries with raw materials and at the same time, in the light of the raw material needs of the industrial branches which support agriculture and light industry and the availability of resources, actively develop heavy and chemical industries.

/2. Open up new resources of raw materials, strengthen technical transformation, change the product mix and speed up the development of the production of consumer goods./

The province has taken the following measures for giving priority to the production of consumer goods and promoting the rationalization of industrial structure:

First, we have vigorously developed a diversified economy in agriculture and readjusted the policy for purchasing the agricultural and sideline products so as to provide light and textile industries with more raw materials. Seventy-three percent of the province's light and textile industries use agricultural products as raw materials. In order to boost production of raw materials for light and textile industries, with the precondition of ensuring an increase in food production, we have readjusted the areas sown with grain crops and industrial crops. Over the past 3 years, the province has gained an additional 250,000 mu of cotton-growing areas; 20,000 mu of areas sown with luo ma [4820 7802] and 68,000 mu of areas sown with oranges and tangerines. To enthusiastically support the economic development of the mountain areas, we have, in succession, increased the sales to, and reduced the purchase quotas of 270 million jin of grain from the mountain areas, reduced or waived 200 million jin in agricultural tax and supported the mountain areas in stopping the opening up of wasteland and returning the reclaimed land to forestry, carrying out afforestation and raising trees, and developed such special local mountain products as tea, Chinese tallow tree, tung oil and rosin. At the same time, linking up with the communes and their subdivisions, the industrial branches of the Provincial Light Industrial Department and enterprises have established a large number of sources of raw materials. A total sum of 10 million yuan was allocated from the provincial reserve fund as loans for the source areas of raw materials to use as working funds. In order to arouse the enthusiasm of the peasants for increasing the production of raw materials for light industry, the province worked out the base price for 13 items of agricultural and sideline products one after another, guaranteed the required quotas, purchased the surplus above the purchase quotas at a higher price or appropriately shared the earnings from the excess production. This has both increased the supply of raw materials for state-run industry and appropriately developed commune and brigade-run industry.

Second, uphold the implementation of the principle of the "six priorities," strive to guarantee the supply of coal, electricity, oil and industrial raw and semi-processed materials which are needed to carry out light and textile industrial production. In terms of distribution of energy, top priority has been given to light and textile industries. Last year the province exchanged 100 million jin of rice and 10 million jin of rapeseed oil with Shanxi Province for 1 million tons of coal, thus making good the shortage of fuel. Of this 100,000 tons were directly utilized and sent to the key light and textile industrial factories by the Provincial First Light Industrial Department. This year we will continue the cooperation with Shanxi Province and import more than 1 million tons of coal to strongly support light and textile industrial production. We curtailed the consumption of the "coal tigers" and "electricity tigers" [enterprises which consume large amounts of energy] in order to save more raw coal and electricity to support light and textile industries and thus to boost production. Several years ago, the light and textile industrial products which had their production disrupted due to the lack of raw and semi-processed materials accounted for 1/3 of the total light and textile industrial products of the province. In the last 2 years, we have enthusiastically worked at the processing of imported and locally supplied materials, thus increasing production tasks. For instance, we annually produced about 50,000 pieces of cotton yarn by processing the imported and locally supplied materials, and this constituted more than 10 percent of the cotton yarn output of the province. We cooperated economically with different provinces and exchanged some goods in great demand which were produced in excess of the output quotas, such as bicycles, sewing machines, cigarette paper and silk quilt covers for light and textile industrial raw materials, such as timber, chemical fibers, rosin, tobacco, soda ash and so forth. We still imported raw materials from abroad for light and textile industries, paying for these with various foreign currency funds.

Third, use funds obtained through various channels to strengthen the technical transformation of light and textile industries and expand production capability in order to produce goods which are in short supply. To expedite the development of light and textile industries, over the last 3 years, we have readjusted the orientation of investment. The ratio of investment poured into light and textile industries to the investment in local capital construction increased from 8.8 percent in 1978 to 15 percent in 1980 and will be 19.1 percent according to this year's plans. At the same time, through various financial channels, we strengthened the technical transformation of existing enterprises and adopted the method of using every means available to center various funds in a certain direction for a period of time and strengthened the weak links in production capability. From 1979 to 1981, the various construction funds used by the provincial first and second light industrial departments and their affiliated organizations totalled 580 million yuan, of which the tapping-renovating-transforming funds and special bank loans accounted for 60 percent. We allocated 70 million yuan from the province's reserve fund to be used as construction loans to light and textile industries which would use them as working funds.

Fourth, vigorously grasp quality, increase product varieties and change the product mix. In the past 3 years, while adhering to the principle of quality coming first and maintaining the strong points of traditional products, we have actively developed new products, new varieties in product design, size and color and in packaging, and have reformed the product mix, raised the precision and depth [shen du 3234 1653] of processing made every effort to achieve a greater economic result while consuming the same amount of raw and semiprocessed materials. According to the calculations of the Provincial First Light Industrial Department, in the total output value of the Provincial Light Industrial Department and its affiliated organizations in 1980, the increase in amount of the output value attributable to changing the product mix and economizing on raw and semiprocessed materials constituted over 1/3 and the increased profit attributable to raising product quality and changing the product mix was 42.3 percent of the total profit increase for the year.

/3. Strengthen market sense, change the product orientation, improve technical service, revitalize heavy industry and strive to maintain a certain growth rate in heavy industry./

During the industrial readjustment, do we simply go all out to promote light industry and discontinue heavy industry? Having made a serious analysis of the situation in which the province's heavy industry has a weak foundation and a relatively great proportion of it serves agriculture, light industry and the market, we maintain that it is necessary to put an end to the former state of affairs in which the speed of development in light industry was excessively low compared with that of heavy industry and it is also necessary to allow heavy industry to maintain a certain growth rate and develop in coordination with light industry.

Over the past 3 years, to maintain a certain speed of development in heavy industry during the period of readjustment, we have done work in the following areas: First, adapting ourselves to the social needs and in accordance with market conditions, we switched in good time to produce other products, thus taking from the long to add to the short. The production targets for capital construction equipment were reduced but this was compensated for by increasing production of the products to be used in the renewal, transformation, forming of complete sets and maintenance of equipment. Second, the enterprises which formerly served agriculture, light industry and the market tried their best to improve their technical service, further open up new markets and increase production. Third, enterprises which produced goods which were in abundant supply, decided on, and produced products which were in short supply and while maintaining production of one major product, produced others as supplementary ones. While grasping well the production of the main products, they practiced comprehensive management, thus boosting production and increasing income. Take the major heavy industrial branches, such as metallurgical, engineering and chemical industries for example:

The metallurgical industry: It formerly had insufficient production capability and its products were mainly small products. During the readjustment period, in the light of market demands, it enthusiastically increased production. The Hangzhou steelworks has doubled its output of small steel products and wire rods in the last 2 years. In specified steel products, it increased the production of leaded steel of types 10, 14, 22 and 25 which were needed in the building industry in the small cities and towns and trial-produced new products, such as a new type of steel which resists corrosion by seawater. Its wire workshop produced newly added umbrella frame wire, spring steel wire and bicycle spoke wire.

The engineering industry: We changed its service orientation and grasped both the production of marketable light products and key enterprises and products. The First Department of Machine-Building and its affiliated organizations stressed the grasping of the production of 38 marketable brand-name products of 48 enterprises and particularly the following four big factories: the Hangzhou oxygen production machinery factory, the heavy-duty machine tool factory, the steam turbine factory and the boiler factory. Of the total output of the Provincial First Department of Machine-Building and its affiliated organizations, the output value of these four factories constituted around 12 percent and accounted for about 20 percent of the department's total profit. During the period of readjustment, these four factories encountered a serious situation in which tyey were being operated below capacity, their equipment was left idle and there were holdups in the work because of poor management of their workers. During the readjustment period, the production targets of the Hangzhou oxygen production machinery factory were sharply reduced. At the beginning of 1980, only 30 million yuan of planned targets were fixed, a decrease of over 1/3 compared with those in the past. At the beginning of this year, it had only 13 million yuan of planned targets and the units which had formerly placed order for goods one after another returned the goods they had received. Under these circumstances, this factory discarded its haughty airs of being a big factory and put an end to the old practice of waiting for customers to come to the door-step, organized leading core cadres and technical personnel to go to more than 10 provinces and municipalities to interview the customers and conduct on-the-spot investigations of the large-sized oxygen production machinery which their factory had produced in the past, and signed a number of contracts with the customers for overhauling and remaking the machines. At the same time, it made good use of the idle equipment and personnel to provide the light industrial trades and professions with compressors of various specifications and other equipment, contracted out quite a number of production targets and thus maintained the historically relatively good levels in production and profits.

The chemical industry: Most of the province's major industrial products, such as chemical fertilizers, acid and soda, plastics, paint and rubber products were needed by the market but the supply of raw and semi-processed materials and fuel were strained. We increased production mainly by practicing economy. For instance, the otuput of synthetic ammonia in 1978 was 390,000 tons and 580,000 tons in 1980, and in the January-August period this year, 400,000 tons of synthetic ammonia has been produced, of which the output of small synthetic ammonia factories accounted for 75 percent. The consumption of anthracite and soft coal by these small synthetic ammonia factories decreased by 1,708 jin in the first half of this year, a decline of 22.1 percent compared with 1978.

/4. Bring the supplementary role of regulation by market mechanism into play under the guidance of state planning./

Under the guidance of state planning, one important condition of the continued growth of the province's industry over the past 3 years was that we paid attention to giving play to the supplementary role of regulation by market mechanism. Over the past 3 years, the major measures we have taken to bring the supplementary role of regulation by market mechanism into play are as follows: First, we vigorously organized coordination of materials. For this purpose, the province set up a cooperating leading group and cooperating office of which a vice-governor was in charge, transferred a number of cadres to strengthen this work. Various localities also generally strengthened the work of the coordination of materials and at the same time, they increased the sources of raw and semiprocessed materials by relying on the strength of various departments and enterprises and by readjusting deficiencies and surpluses of raw materials in the production materials market. Second, we carried out the processing of locally supplied and imported materials or let the enterprises contract out production tasks on their own accord and "look for new sources of materials to feed their machines." Third, we strengthened marketing work, adjusted ourselves to the needs of the market and promoted production through marketing. A lot of companies and factories and mines set up their own individual marketing sections and enhanced their ability to promote sales of their goods. At the same time, to allow the normal regulation by market mechanism and to meet the requirement of enlivening the economy, we appropriately relaxed policies and made some necessary changes within the scope permitted by the state policies on prices, taxes and market management.

We grasped circulation and promoted production. To do a good job of marketing, we organized the supply and marketing organs at the provincial, prefectural and county levels into an interconnected network of supply and marketing, keeping all organs informed and integrating purchase with marketing. Haining County established cooperative relations with 219 units from 20 provinces and municipalities and as a result, the raw materials needed for production in the 28 cooperative factories all over the county this year were by and large arranged and their products have found a market.

In order to bring into play the supplementary role of regulation by market mechanism and promote production, we made some necessary changes in the economic policies. The province practiced, with a little flexibility, the principle of "being lively within stability" in regard to price for the means of production used in carrying out the cooperative activities. Some flexible measures for the prices of the products of the commune and brigade-run enterprises and some collectively run enterprises were also stipulated. For instance, for the major products which are subject to unified purchase and marketing by the state and are produced by self-supplied materials appropriate price rises of up to 10 percent are allowed. For the products which are not subject to unified purchase and marketing by the state and products processed from materials supplied from outside, negotiated prices are also allowed.

/5. Appropriately expand production capability and raise the levels of production and technology through the technical transformation, expansion and reconstruction of existing enterprises./

In capital construction, owing to the curtailment of investment and the readjustment of its structure, the proportion of investment in industry in the total amount of local investment decreased from about 60 percent in the past to below 30 percent. With limited investment, we were resolved to discontinue the projects which required heavy investment and yielded poor results and whose techniques were not up to standard, readjust the orientation of investment and put the stress on the continuation, forming complete sets of, expansion and transformation of the existing enterprises which required less investment and promised quicker results. At the same time, we granted loans to the projects which had the ability to repay, thus raising the investment results. For instance, we arranged loans this year for 38 capital construction projects of which 20 were anticipated to be completed and put into production this year. In addition, the construction bank arranged credits for 129 small-scale projects of which half were expected to be completed and put into production this year. The economic effect of these projects is relatively good.

The projects which used tapping-renovating-transforming funds, including some projects of a capital construction nature which are to be expanded and restructured, have enhanced the production capability for goods whose supply falls short of demand. The funds for tapping-renovating-transforming throughout the province were 10 or 20 million yuan annually before 1978 but they reached more than 200 million yuan annually both in 1980 and 1981 after the practice of assigning the local financial authorities responsibility for task completion was introduced, the experiments of expanding decision-making power of enterprises was carried out and the method of banks granting special loans was practiced. Three hundred and seventy technical-measure projects were completed and put into production last year and 109 projects were completed and put into production in the first half of this year. The newly added industrial output value created by these projects which used the tapping-renovating-transforming funds was more than 700 million yuan in 1980 and is estimated to reach 800 million yuan this year, constituting about 1/3 of the amount added to the total output value of the province this year.

Apart from the budgeted financial allocation and various bank loans, to raise funds, the province set up a capital construction investment company. One hundred million yuan of funds were raised from the province's reserve fund to be used as loans for capital construction projects which would use them as working funds. The province also set up a provincial cooperative investment company and 46 companies of that kind at municipal and county levels in Hangzhou, Shaoxing, Huzhou, Quzhou and so on. The Hangzhou Investment Company extended 24.17 million yuan of credit in the January-June period this year to support 101 tapping-renovating-transforming projects of which 58 were light and textile projects.

/6. Industrial departments have begun to pay attention to the popularization and application of science and technology in production and strengthened the training of the technical force and factory-run scientific research has begun to develop to some extent./

Along with the initial reform of the economic structure and the step-by-step expansion of decision-making power of enterprises in production management, the socialist competition is being carried out within certain limits and the industrial departments and enterprises have begun to attach importance to raising the level of production techniques and the ability of their products to compete. This has promoted the transfer of knowhow; the factory-schools combined manufacturing and technical cooperation between different factories, thus enabling science and technology to become actual productive forces as quickly as possible. For instance, the Shaoxing porcelain factory has achieved 20 findings, such as economizing on energy by mixing coal and oil and the making of clothes hooks by direct heating. The 1980 output totalled 25.23 million pieces, an increase of 67.5 percent over 1979 and the 1980 profit was 1.35 million yuan, 90.8 percent more than that in 1979.

Although the growth rate of the province's industrial production has been relatively fact over the last few years, there are still quite a number of problems facing us. First, the products of some enterprises have failed to be adjusted to the needs of the market and they have become unmarketable and overstocked as a result. Second, the economic and technical targets of enterprises are relatively backward and the output value created by every 10,000 yuan of expenditure is 30 percent lower than that of Shanghai and the profit created by every 10,000 yuan expenditure is 56 percent less than that of Shanghai. Third, there has been an obvious reduction in speed of development this year compared with that of the preceding 2 years. This is mainly because the growth rate of the industry under the system of ownership by the whole people and especially heavy industry is relatively low. To continue to maintain a certain speed of development in industry and accumulate strength for further development, it is necessary for us to further conduct investigations and study and correctly assess the situation of the province's industry. With the powerful backing of the whole country and under unified state planning, we must develop our advantageous factors and overcome our disadvantageous ones, stress the grasping well of the production of raw and semiprocessed materials and the replacement and transformation of equipment, truly enhance the capability to intensively expand reproduction and at the same time pay attention to continuously raising the technical level and managerial and administrative skills.

DEVELOPMENT OF INDIVIDUAL ECONOMIES IN GUANGZHOU EXPLAINED

Beijing ZHONGGUO CAIMAO BAO in Chinese 8 Sep 81 p 2

[Article by He Jingpei [0149 4842 3099]: "How Has Guangzhou Developed Individual Economies?"]

[Text] Beginning in August, 1979, the municipality of Guangzhou began restoring and developing individual economies based on nonagricultural industries in the cities and towns. Some fairly obvious results have been achieved to date. By the end of July of this year, a total of more than 16,600 people have been returned to or added to nonagricultural individual economies; this is 53.7 percent of the 1957 figure. The municipal departments concerned plan for the next step to be a further hiring of 15,000 people, a restoration to the 1957 level.

Although it has only been 2 years since the restoration and expansion of nonagricultural individual economies, and the number of people involved has not attained the previous highest level, it already plays an inestimably positive role in economic life.

First of all, it has invigorated the market, been convenient for the masses, and made up for the inadequacies of the state and collective commercial networks. Historically, there have been a relatively large number of commercial networks and businessmen in the city of Guangzhou. In 1955, there was an average of 4.5 commercial networks and 10 commercial service personnel per 100 citizens, but by the latter half of 1979, these had decreased to an average of 0.4 commercial networks and 4.4 commercial service personnel per 100 citizens, which brought inconveniences to the lives of the masses. During this restoration and expansion of individual economies, more than 10,000 individually run stands have been quickly established and this has greatly made up for the inadequacies of the state and collective commercial networks. They have basically played a very positive part in solving the "eating," "clothing" and "repair" problems of Guangzhou. The small eating establishments especially have spread all through the streets and alleys operating night and day serving whoever comes to eat. It is extremely convenient for the masses. Some traditional Guangzhou foods, such as "green sweetened bean paste," "your lordship chicken," "roast goose," "fried vermicelli," and others have made a comeback and been welcomed by customers at home and abroad.

Secondly, it has expanded social connections for securing a job and promoted social stability and solidarity. By the end of June 1981, more than 5,300 youths in the whole city were formally registered as self-employed constituting 32 percent of the total self-employed people. In addition, there were many individually operated businesses which were registered by parents and run by the children. It is estimated that this number totals some 5,000 to 6,000 youths, which is equal to the formally registered number.

Thirdly, it has promoted improved management by state and collective enterprises as well as improving the quality of service. Take some of Guangzhou's past collective and state operated eating establishments as an example. Due to single family management and supply not meeting demand, variety in these establishments was monotonous, business hours short, and quality of service lacking. Time and again there was no improvement in the opinion of the masses. Now, since independent eating stands have begun operating, their variety is great, they have the latest products, they are economical and practical, they offer good service, and are soliciting large crowds of customers. Because of these circumstances, eating establishments where service was poor were not frequented and thus they were forced to improve management and service.

The restoration and expansion of nonagricultural individual economies in Guangzhou occurred fairly quickly. The enterprises employing youths are especially numerous. Isn't there much to be learned from these experiences?

1. The party and government should emphasize the restoration and expansion of individual economies as something to be grasped. The Guangzhou municipal party committees and the municipal government have already on two occasions organized the committee's general office's research office, the municipal finance office, and the industrial and commercial bureaus to do research. On the one hand they have used the facts to teach the cadre and masses to recognize the important significance of the development of individual economies and on the other hand they have focused on the problems which emerge in the process of work in order to make suggestions for improvement in a timely manner. The municipal government also issued special notifications requesting relevant departments to make efforts in coordination and positive support. All districts and streets also worked actively to make the state's policies and guidelines regarding youths seeking a profession and the development of individual economies known to all and to help them take root in the hearts of the people.

2. We should further liberalize ideas, broaden policies and adopt measures on all fronts to greatly support and foster the development of individual economies. For instance, in management styles, there can be single person management, whole family management, and "partnerships" can also be permitted. There must be compliance with the requirements and there will be no limits on the number of people involved. As for goods supply or raw materials, it must be clearly stipulated that individual businesses can go to state wholesale departments to lay in a stock of goods, selecting three types of goods for purchase with two types being appropriately allocated to the point of "controlling without restricting." This will also allow them to enjoy the difference between wholesale and retail prices the way the state and collective businesses do. As to prices, the freely purchased portion would be permitted to have the prices set by the market.

3. There are economic attractions. The departments concerned stipulate that only if the businesses are run legally will there be no limits on the amount of business done and the income. However, it is acceptable to earn quite a bit of money with

no fear of becoming "conspicuous." At present, the average income per person per month for individual businesses throughout the city is more than 100 yuan with the greatest being 300 yuan. For this reason, the majority of the young engaged in individual economies are relatively comfortable with their professions.

4. Effective measures should be adopted to assist those youths awaiting employment in solving the problem of whether to engage in an individual business or not. There are basically three methods for this: One is when the parents are managers of an individual business and have a definite skill and management enterprise, the youth awaiting employment is moved to learn the skills from the parents and engage in the business together with them; another is to mobilize and organize retired people with technical expertise and management experience to lead the youth to become apprentices or helpers and learn while doing; the third is for various special short classes to be operated by block or labor service companies attracting the youths to study voluntarily at their own expense to acquire the skill to engage in an independently operated business.

Although the city of Guangzhou has achieved gratifying results in the restoration and expansion of nonagricultural individual economies and giving impetus to the young seeking their own profession, some problems still exist. The most obvious one at present is that there is not a very good resolution to the problem of a system of control. At present, independent businesses are mostly controlled by neighborhood service centers and the neighborhood merely collects management fees and does very little managing. At the same time, the standard fees collected have also increased. In accordance with the stipulations of some areas, the management fees paid by different types of businesses is 1-5 percent of business. This is already very high but some neighborhoods collect 15-20 percent and others also add in "fees for occupying the street," "health fees," "garbage fees," and various other fees. There are a multitude of things which influence the activism of those independent businessmen.

JOURNAL ON AGRICULTURAL, TRADE MARKET

HK121026 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 81 pp 48-50

[Article by Yu Shamu [0060 3097 1606]: "How Did Shenyang Municipality's Agricultural and Trade Market Begin to Flourish?"]

[Text] In the well-known industrial city of Shenyang, the largest municipality in the northeastern part of our country, around 130 prosperous agricultural and trade markets are found all over the city, not only around the lively downtown area but also in the suburban parts of the city. Under the spacious plastic roofing of the markets and among their well-laid-out piles of goods, the customers bustling about select their purchases as they please not only from products of Liaoning Province, such as the principle food grains, miscellaneous grains, edible oil, livestock, aquatic products, eggs, vegetable, dried and fresh fruits, and other daily-use products, as well as other agricultural and sideline products, and special local products, but also from agricultural and sideline and other special local products from 20 other provinces and districts, such as yellow tobacco and sunflower seeds from Jilin Province, soybean, and edible fungus from Heilongjiang, soft-shelled turtle from Sichuan and Anhui Provinces, fresh fish from Zhejiang Province and related areas, and other products. There are about 200 commodities on sale in these agricultural and trade markets of varying sizes everyday. The total daily transactions amount to more than 300,000 yuan. Then how did these agricultural and trade markets begin to flourish? Recently, we visited the departments concerned of Shenyang with this question in mind and found out its secret.

A Regulatory But Flexible Policy

The agricultural and trade markets of Shenyang Municipality, which enliven the urban and rural economy, belong to one form of the traditional market of our country just as the rural fair trade markets all over the country do. Unfortunately, since 1962, especially during the 10 years of the "Cultural Revolution," these markets have been regarded as "soil for capitalist restoration" and have been restricted and eliminated. As a result, the channel of commodity circulation has become unitary. This impedes the exchange of commodity supplies between the urban and rural areas and causes the spread of unhealthy practices in the supply and sales of commodities and resentment among the broad masses of the people. The Shenyang Municipal Party Committee has studied the historical experiences and lessons and has noted the fact that the rural fair trade markets of the urban and rural areas are a necessary supplement to the socialist economy at the present stage, as such markets enliven the economy, make things convenient for the people, improve the supply of goods, and render services to the people. Consequently, they are a form of market which complies with the needs of the people. For this reason, in September 1978 they reopened the agricultural and sideline product markets within the city as well as in the suburban parts of the city.

For 3 years, the Municipal Party Committee, the municipal government and the departments concerned have done an immense amount of work to enliven the agricultural and trade markets of the municipality. Experimental points were first set up in Daxi, Beihang, and other parts of the city for the purpose of getting experience and then restoring one after the other the traditional rural fair trade markets of the various districts as well as opening up new trade markets so that the agricultural trade could be restored and developed in the whole city. From 1979 onward, planning and construction work for these markets was undertaken as an integral part of the general planning for construction for the city as a whole and in close connection with the improvement of the appearance of the city. In the drawing up of plans for the construction of these marketplaces, special attention was paid to simplicity and thrift, economy and practicality, convenience and good appearance, uniqueness of style, avoidance of the over-size and the seeking of western aspects. Generally speaking, in the case of the large markets, the commodities are classified according to the various trades. In this way, they can better meet the needs of specialized management, improve orderliness in the markets, provide service facilities and so on as well as varying designs. For the construction of the marketplaces alone, more than 120,000 yuan was spent in 1980, of which 28,000 yuan was government funds and the rest was either low-interest bank loans or contributions from the state and collective entities taking part in the markets. In order to stabilize the city market economy and the prices, the market management departments are taking the initiative to attract and admit various economic elements into the markets. They have also cleared up the various circulation channels, got into contact with the places of production, priority producers, specialized producers, self-marketing industrial units and commercial departments by providing them with market information, inviting them for visits, sending out people to contact them and other methods to open up new sources of supply and to market surplus products. There are some 990 purchasing agents working for these markets. Concerning the long and short-distance peddling trade undertaken by individuals, which had once been regarded as "repeddling" and banned, new regulations were promulgated before 1979, legalizing this trade and declaring it nonexploitative behavior as long as it was within the capability of an individual, requiring only a small amount of capital and netting small profits. Furthermore, for the convenience of inspecting the prices, price tags are required for all goods in the market, displaying not only the exact price, but also the price range of the previous day as a reference price. The state-run retial enterprises are advised to sell their products at lower prices to stabilize the price levels. To facilitate the livelihood and the business of the traders, integrated markets have been set up step-by-step with agricultural and sideline products as the staple commodities, along with light industry and textile products and secondhand goods as well as commercial and snack shop services. Specialized markets have also been set up in localities where the supply of a certain commodity converges. The municipality has decided to construct 19 large specialized and integrated markets and expand eight such markets. At present 10 new specialized markets are in operation. For the sake of safeguarding the prosperity and orderliness of the markets, the Municipal Industrial and Commercial Administrative Bureau, the Municipal Security Bureau, the Municipal Public Health Bureau, the Municipal Animal Husbandry Bureau, the Municipal Food Corporation and other organizations have formulated respectively the following "small legislative measures": "a number of rules concerning market control," public health regulations on food, measures for disease inspection for meat for sale, and so on. With the development of the agricultural and trade markets, the management of the market administrative departments has been constantly strengthened.

A Lively But Not Disorderly Administration

Only 2 or 3 years ago, at the mention of free markets, people had the following disorderly picture in their minds: mixed and disorderly vending stalls, noisy and boisterous hawking, bickering over giving a short measure, dirt and filth all over the place, and the chasing away of the "law violators" by the market administrative personnel. However, all these visions are totally changed when you visit the Shenyang agricultural and trade markets now. Instead, you will see orderliness everywhere, trading carried on without rush, plentiful goods for sale, neat and clean surroundings, and very pleasant market administrative personnel wearing dark-green woolen badges to help the traders. This new sight certainly makes people realize that the management system has changed.

The comrades of the Municipal Industrial and Commercial Administrative Bureau told us that the reason why their administrative method has been totally changed is that the administrative personnel's feelings for and their relationships with the traders have fundamentally changed. In the past, they regarded the peasants selling their own produce and the traders as targets for detention. Today they have finally come to an understanding of the real story. These people are the targets for services. Undoubtedly, a change from "detention" to "service" is indeed a change in substance. During our visit to the agricultural and trade markets, we found that the administrative personnel at all levels are generally imbued with the guiding ideology of "catering to the prosperity of the agricultural and trade markets." On the basis of the principle of regulation but not strangulation, and liveliness but not disorder, they closely link propaganda education, economic management and administrative control. While enlivening the market, they unrelentingly crack down on speculation, do their inspection work closely, and seriously deal with the misbehavior in connection with market administration, public health, security, orderliness and so on in order to ensure the prosperous and healthy development of the market operation. The specific measures they take in strengthening the overall administration of the markets can be grouped into the following three aspects:

(1) Gain good control over the traders and the commodities on sale. Give protection to lawful transactions and ban the unlawful activities. Make clear which people and which commodities are allowed to enter the market and take part in transactions, and the proper way to carry on the transactions. This is the foundation of the administration of the markets. For this purpose, "eight approvals" and "four disapprovals" are stipulated in explicit terms. The eight approvals are: lawful admittance to the market for commune members, production brigades,

livestock farms, farms, commercial, peddling and collective units and urban dwellers as well as the bringing into the market of lawful commodities to be sold in compliance with the regulations specified by the state policies. The four disapprovals are: teaming up to form a gang, colluding inside as well as outside the markets, deceiving the buyers and monopolizing the market, hoarding for resale, and engaging in speculation and profiteering; shipping on consignment by boat and land vehicles, reselling and repurchasing in large volumes on wholesale terms to reap huge profits; giving up one's profession to engage in the peddling trade the year round; and adulterating and giving short measures of goods with the aim of deceiving people. Speculation, profiteering, and related activities are to be strictly banned.

As for the industrial products, secondhand goods, livestock, meat, poultry and other products which are permitted in the market, several rules have been promulgated by the Municipal Industrial and Commercial Administrative Bureau in coordination with the Municipal Security Bureau, the Municipal Livestock and Foodstuffs Bureau and some other departments concerned. For example, the sale of dangerous products, superstitious articles, gold, silver, articles that are harmful to social morality and customs and licensed goods such as pharmaceuticals, tobacco, wine and so on is prohibited. It is stipulated that any collective entity or individual must produce the residence booklet and a certificate endorsed by the department concerned when various daily-use articles or means of production are brought to the market for sale. The sale of watches, bicycles, other durable consumer's goods, industrial implements, supplies as well as other products must be registered with the administrative department of the market and put on record. A letter of introduction from the authority higher than the production brigade level and a certificate issued by a veterinary station must be produced when cattle and cattle meat are put up for sale. All vendors' stands (stalls or both) as well as peddlers must possess a business license. All meat and poultry for sale must be examined by the disease inspection station and duly stamped. The sale of any rotten or deteriorating food or beverages that are harmful to health is prohibited.

(2) Ensure good work in the administration of the markets and in maintaining security, good order, services, public health standards and so on. In order to facilitate administration work, the market is classified in terms of trades, and business is transacted by categories. The personnel in charge of the markets are divided into two groups, the administration personnel and the service personnel, both under the Municipal Industrial and Commercial Administrative Bureau. They undertake specific duties in the administrative offices and work groups of the markets respectively. Responsibilities of personnel of the Municipal Industrial and Commercial Administrative Bureau, the security personnel on duty, the service and public health administrative personnel are divided by districts and sections.

In order to maintain security and good order in the markets, the police stations which have markets in their jurisdictions assign specific personnel to the medium- and small-sized markets respecitvely. Security and on-duty offices or substations are attached to the large markets to support administrative security work. In addition, appropriate members are selected from the administrative and service personnel of the markets to form security groups of a mass nature (also known as public security committees or groups) to assist the government security departments in ensuring security. There are five main tasks for the administrative security work of the markets: formulating security regulations, publicizing the legal system, carrying out routine inspections, solving the outstanding problems of the various market and ensuring good intelligence and control as well as other tasks.

Concerning the cleaning of the markets, three methods have been adopted respectively: to have specific members of the service personnel of the markets responsible for the cleaning; to delegate the responsibility to the environmental cleaning departments; and to give the job along with a reward to the neighborhood.

Besides, for the benefit of the administration of the markets as well as that of the broad masses, the market administrative offices usually either take as their own business or organize certain departments in setting up inns, restaurants, snack bars, vending trucks, drinking stands, check rooms, parking lots for bicycles, as well as providing standard scales, boxes for examining eggs, pots for keeping finish, cages for keeping hens and ducks, chopping blocks for cutting meat, funnels for draining oil, sewing kits, strings for gunnysacks, packing paper, first-aid-kits and so on, which number more than 20 services.

(3) Strengthen the training of the service and administrative personnel for the markets. Strengthening the administrative personnel of the markets and enhancing the quality of their work are keys to good administration of the markets. Last year, without making additions to the government-authorized personnel level, the Shenyang Municipality started to select nearly 200 youths awaiting employment and organized a service team for the markets. They have been assigned to the various markets to take part in the administrative and service work. The service team has the nature of a collective ownership organization, having its own independent accounting system and taking full responsibility for profits and losses. Its income comprises fees for market services, fees for market administration (only a part of it) as well as the income from acting as a purchase and sales agent for the customers. The wage standard and other benefits of the team members are based on those of the staff of the agricultural and trade markets as well as those of the collective entities. In order to enhance the understanding of policy and the professional ability, short training courses have been designed for the administrative and service staff to take on a rotational basis. They also exchange their experiences frequently.

For the purpose of giving full play to the enthusiasm of the administrative and service staff of the agricultural and trading markets, the Municipal Industrial and Commercial Administrative Bureau has formulated a tentative unified code for the system of personal responsibility, which stipulates the responsibility of the working staff, the criteria and methods for evaluating their performance, and means of giving bonuses and awards.

As shown by the experiences of Shenyang Municipality, the key to "regulation without suffocation and liveliness without disorder" lies in the presence of the proper policy and administrative work. Once the personnel can perform the administrative work properly, the agricultural and trade markets are bound to prosper healthily and duly fulfill their functions.

FOREIGN TRADE

FOREIGN CAPITAL UTILIZATION IN BEIJING'S ECONOMIC DEVELOPMENT

Beijing BEIJING RIBAO in Chinese 13 Oct 81 p 1

[Article by correspondents Feng Xiuying [7458 4423 5391] and Yan Xing [7051 2502]: "Full Utilization of Foreign Funds for Development of Economic Construction by Departments Under the Municipal Economic Commission--66 Production Lines Imported or Transformed through Use of Foreign Funds, and 41 of Them Are in Operation"]

[Text] Some production units under the Beijing Municipal Economic Commission have utilized through various channels foreign funds for the development of economic construction in the capital, with fairly great success.

Since the adoption of an open door economic policy at the 3D Plenary Session of the 11th Party Central Committee, some enterprises under the municipal economic commission, with the assistance of the foreign trade departments and the Beijing General Economic Construction Company, have adopted the methods of compensatory trade and processing materials and assembling parts supplied by foreign customers, and signed more than 300 economic contracts on the use of foreign funds to import advanced equipment and technology. The increase of productive capacity in these enterprises has rapidly increased their outputs. In the last 2 years, the units under the municipal economic commission have also used foreign funds to import or transform 66 production lines; 41 of them are now in operation. The annual assemblying capacity of TV sets is now increased to 450,000 for 12-inch black-and-white sets and 200,000 for color sets. The assembling capacity of tape recorders is now 590,000 sets a year. The production of eye glass lenses is increased to 10 million pieces; that of nylon zippers, 150,000 meters; and that of alkyd resin, 4,500 tons a year. Through the processing of materials supplied by foreign customers, the Municipal Garments Industry Company has used the proceeds from this source to purchase some high efficiency foreign industrial sewing machines and imported or transformed 12 garment production lines. Each year, this company is capable of producing more than 10 million additional garments.

The importation of advanced equipment, advanced technology, and advanced experiences of scientific management has promoted the improvement of enterprise management. The Dongfeng Television Plant of Beijing had 251 workers assembling 9-inch black-and-white TV sets, and this team's output was only 200 sets. After importing an assembly line for 12-inch black-and-white TV sets and adopting foreign scientific methods of management, the output of a team of 131 persons has been increased to 600 sets.

The use of foreign funds for importing advanced equipment and advanced technology has brought about large-scale increases in exported commodities. Because of the judicious use of foreign funds for the expansion of productive capacity, the output for export has increased. At present, the exported products of Beijing has reached 131 countries and regions.

Processing materials supplied by foreign customers and compensatory trade sometimes call for high labor intensity and can therefore provide more jobs to unemployed youths. In the last 2 years, more than 6,000 youths were given jobs in the garment trade; and 1,000 of them were accommodated in the production of envelopes to be used on special occasions by foreign traders.

SHANGHAI'S ANNUAL EXPORT PLAN FULFILLED AHEAD OF SCHEDULE

Shanghai WENHUI BAO in Chinese 17 Oct 81 p 1

[Article by unidentified correspondent: "Shanghai's Export Plan for Current Year Fulfilled Ahead of Schedule With Improved Product Quality, Increased Designs and Varieties and More Attractive Packing; Ratio of Industrial Goods Continues To Increase With Corresponding Decrease of Agricultural Sideline Products in Export Trade"]

[Text] Shanghai, the largest foreign trade port in China, fulfilled the state export plan for 1981 2 and 1/2 months ahead of schedule. By 15 October, according to the statistics of the Shanghai Municipal General Foreign Trade Company, 100.15 percent of the foreign exchange earning puota through exported goods was fulfilled.

Among the 13 import-export branch companies and two other branch companies acting mainly as agents for the import and export of industrial goods, all operating under the Municipal General Import-Export plan. The export of edible oil, mineral metals and chemical-industrial and handicraft products was more than 10 percent above the annual plan; the export plans for silk, textile products, garments, animal products by the branch companies were also overfulfilled. The export of native products, light industrial products, foodstuff and machinery by the branch companies also exceeded the average speeds as stipulated in the plans.

Since the beginning of this year, there have been improved quality, more designs and varieties, and more attractive packings for the main exported products in Shanghai. Along with the continued development of industrial exports, the product mix of exports from Shanghai has changed, as shown by the continued increase of industrial products and decrease of agricultural sideline products.

Shanghai's exports, according to the annual plan, have made fairly good progress. Besides relying on the efforts of the production and procurement departments for the availability of products for export, according to state plans, Shanghai has also imported urgently needed raw auxiliary materials to be processed into finished products for export outside the state plans It is anticipated that the value of exported goods will be increased by more than 1 billion yuan this year. The value of exported products to be supplied by the outlying counties to Shanghai is estimated to be more than 500 million yuan, an increase of 20 percent over last year. The products are of fairly solid quality and are produced in small batches. There are many varieties and their delivery is prompt. Therefore, these products are playing a large role in promoting the export trade. At the same time, great efforts are being made to promote compensatory trade, and the processing of materials and assembling of parts supplied by foreign customers, in addition to importing advanced technology and increasing the export of easily marketable goods. Its clientele has expanded from Hong Kong, Macao and Japan to 17 countries and regions, including Australia, and the product mix has also expanded from those of high labor intensity to light industrial, textile, electronic and chemical-industrial products and instruments and meters.

To stimulate foreign trade, the foreign trade departments of Shanghai have stepped up their investigations and study in the conditions of the world market and adopted the method of "inviting in and going out" in organizing transactions. In the first 9 months of this year, the Municipal General Company of Foreign Trade, in collaboration with the relevant special general companies in Beijing, have dispatched 197 foreign trade groups of more than 370 persons abroad to hold exhibition and sales fairs and international fairs. At the same time, more than 14,300 foreign traders from various countries and regions have been invited here to discuss business and to attend meetings held in Shanghai for the sale of downy products, leather shoes, leather goods and silk. Many large transactions were completed at these meetings.

The port administration and communication-transportation departments in the municipality have strongly supported the export trade by speeding up the transportation of exported goods. In so-doing, they have also made important contributions to the fulfillment of the export plan ahead of schedule.

VILLAGE TRADE FAIRS, RURAL ECONOMIES DISCUSSED

Beijing ZHONGGUO CAIMAO BAO in Chinese 22 Sep 81 p 3

[Article by Sun Deshan [1327 1795 1472]: "Active Village Trade Fairs and Flourishing Rural Economies"]

[Text] Since the Third Plenary Session of the party, all localities are implementing rural economic policies, developing agricultural production, and achieving great results. In areas of circulation, rural market trade is beginning to develop throughout the country. The rural economies are flourishing daily. However, in some areas a definite resistance to the development of rural markets still exists. They are not being allowed to play their full role. For this reason it is worth probing into the nature, use, and management problems of market trade.

I. The Nature of Rural Market Trade

Rural market trade is one channel for the circulation of commodities. The origin of our rural commodity trade markets is very old. In feudal societies and semifeudal semicolonial societies, the country trade fair was a vassal of feudal and capitalist economies. After the establishment of the People's Republic of China, revisions in the old country fairs were made and new, village trade fairs were established. In this way, the nature of the village fair underwent some basic changes. In a unified socialist market and with the leadership of state trade, it becomes a place where rural villages meet each others needs and surpluses and shortages are adjusted. It takes on a socialist nature and is basically different from the capitalist, free market. Furthermore, it "is a necessary supplementary sector of socialist trade."

In a unified socialist market, state businesses, as a means of circulation, hold a leading position and supply/marketing cooperatives, as a means of circulation, are powerful assistants to state business. Village trade fairs as a means of circulation is a necessary supplement to state businesses and supply/marketing cooperatives. Practical experience has shown that with only state businesses and the supply and marketing cooperatives, it is impossible to bring together all of the myriad agricultural and sideline productions. In the product circulation area, village trade fairs are an indispensable means of circulation.

II. Effects of Rural Village Fair Trade

Current phases of village trade fairs are being implemented under the unified leadership and control of the state. It plays a promotional role in the development of collective and individual economic diversification.

Since the founding of the PRC, particularly in the past few years, the role of brisk rural village trade fairs in the flourishing rural economy has been extremely obvious. According to statistics on over 200 village fairs held by the relevant departments, agricultural and sideline products sold by peasants at village fairs in 1980, topped more than 570 million yuan, an increase of 37 percent over 1979. The prices of rural village fair goods are generally stable and in goods where there is a balance between supply and demand there is a downward trend. In a comparison of 1980 with 1979, the difference between market price and list price decreased by 3 percent. There was a price decrease in 10 major commodities: millet, wheat, corn, edible vegetable oils, pork, cabbage, and piglets. This shows that as agricultural production develops, agricultural products increase and market prices can stabilize and decrease.

In 1980, traditional morning markets, night markets, mountain fairs, mule fairs, and village fairs in minority areas resumed in many regions. These markets supply each other's needs, satisfying the different desires of all the areas. They play an active part in promoting the gradually prospering rural economy. This illustrates that: aspects of state businesses (including the supply/marketing cooperatives) and single family operated businesses have changed; methods of operation have multiplied; and the means of circulating goods have also multiplied. Rural markets throughout the country have, in sweeping out the dull depressing atmosphere of the past several years, a refreshed atmosphere.

III. Opinons on Expanding Rural Village Trade Fairs

The following opinions are proposed to further enliven the rural village trade fairs and to promote prosperity of rural economies.

1. Increase Control. In expanding rural village trade fairs, first of all, the influence of "leftist" thought must be purged while grasping the basic points of a socialist society and persisting in following socialist paths and directions. Many regions have increased control of village trade fairs and have played a definite role in bringing prosperity to rural economies. However, other regions have let the village trade fairs drift and this has had a negative effect. For this reason, it is necessary to increase control of village trade fairs. (1) All categories of agricultural sideline production must be completed on time in the quantity and quality as set down by the state. (2) No persons or units will be allowed to illegally purchase agricultural sideline products from state stores of supply/marketing cooperative retail stores for resale at increased prices. Speculation or deception practiced to dominate the market will not be allowed. Hoarding to drive up prices will not be allowed. (3) Goods trafficking by communes and brigades should be ratified by the local industrial and commercial administrative control department. Surplus agricultural sideline products, except for one category, may be transported for sale to nearby communes and brigades after sales obligations to the state and contracts are fulfilled. (4) Cooperative shops, cooperative teams, and documented individual peddlers will be permitted, within a stipulated management scope, to engage in transporting agricultural sideline products for sale between city and rural areas. In summation, effort should be made to see that such trade is "controlled, but not stifled; enlivened, but not chaotic." Full play should be given to its positive effects while the negative effects should be limited allowing it to serve even better in enlivening agricultural trade markets and bringing prosperity to the rural economies.

2. Insure Competition. Practical experience has shown that the development of competition between enterprises, with the principle prerequisites of a persistence in the socialist way and a persistence in a planned economy, has played a motivating part in the improvement of product quality, and in conserving human, financial, and material resources. In order to support production, promote circulation of goods, and make things convenient for the people; allow some competition in rural markets. The advantages are numerous and the disadvantages few. Through competition, the revision of management control in commerce can be promoted, and an increase in commodities, moderate prices for fine goods, and stable prices can be promoted. In a socialist society, if there is competition protected by leadership then social progress can be propelled forward. Of course, breaking away from free competition led by state commerce is harmful.

3. Permit Long Distance Transport, Resolutely Ban Speculation, Profiteering and Activities Which Benefit Individuals at the Expense of the Public. According to government regulation, rural communes, brigades, and collectives may, after satisfying state purchase obligations and fulfilling negotiated purchase contracts, transport for sale two or three categories of surplus agricultural sideline products which the state has not purchased as long as the state purchase obligation is not affected. Commune members, with the agreement of the production brigade can, using, their own power (hand-carry, backpack, pull, or bicycle), engage in the transport of agricultural sideline products to permissible cities. The purchase of large-scale transportation tools such as automobiles, tractors, or motorboats by private individuals for use in moving goods for sale is not permitted. The sale of their own agricultural sideline products by individual brigades or commune members is not considered trafficking in goods. Goods trafficking is purchasing at point A, transporting those goods and selling them at point B. Transportation and sale is transporting one's own products to another place for sale. These three concepts must be made clear. Our policies treat them differently. The transportation and sale of self-producted goods should be protected. Goods trafficking, whether long or short distance, should be restricted. Exceeding permissible limits should be controlled and not allowed to drift along. In hard to reach rural villages and mountain areas, since the state businesses and supply/marketing cooperatives are not sufficiently strong, some items may be transported over long distances for sale in order to enliven the rural economies of these areas; some items however, are restricted from long distance transport. This is to say that there are no necessary limits, in the transportation and sale of goods, whether legitimate or illegitimate, based on long or short distances, but they should be in conformity with the transportation and sale of agricultural sideline goods within the scope of the standard policies and regulations. If these activities are beneficial to the state, the producers, and the consumers, then they can all be considered legitimate.

At present, rural economic conditions are good. However, there are still some lawless elements bent solely on profit-taking. These people must be treated in accordance with the State Council's instructions on cracking down on speculation, profiteering, and smuggling by tightening market controls and resolutely cracking down. Any unit or individual engaging in speculation or profiteering, in addition to forfeiting or not receiving their property as per government regulation, shall be turned over to judicial organs for punishment under the law.

4. In the Circulation Areas, Persist in Guidelines Which Funnel Goods to the Areas, and Not Adopt Methods Which Cut Them Off. Although current means of

circulation are more numerous than in the past, and marketplaces for village trade fairs have increased greatly, there are still a lot of places where there are obstructions, and there is still a great deal of work to do in clearing up misunderstandings. As for the portions which appear to be in disarray, great effort is required to disseminate policies, educate the masses, and adopt effective leading measures to bring things around to the correct way. It can be said that without working to open channels there can be no free flow of goods or letting things serve their proper purpose. In the future, in the realm of circulation and in the development of village trade fairs, our guiding ideology should be such that we open up channels, not stop them up or cut them off. We must further enliven village trade fairs and bring prosperity to the rural economies.

GENERAL

REORGANIZATION OF ENTERPRISES, TECHNICAL TRANSFORMATION DISCUSSED

Jinan DAZHONG RIBAO in Chinese 5 Nov 81 p 3

[Article by Liu Yaohua [0491 5069 5478]: "Effectively Reorganize the Enterprises and Transform the Technology"]

[Text] Along with the intensive and extensive implementation of the policy of readjustment, restructuring, consolidation and improvement of the national economy, now a very important task confronting us is how effectively to reorganize the enterprises and transform the technology in order to raise the organizational structure of industrial enterprises and the technology of production to a new level. These jobs will not only enable us to maintain a certain growth rate for industrial production, but also create the necessary conditions for the smooth progress of the four modernizations. We must recognize their importance in ideology and practice them well.

The so-called reorganization of enterprises means their reorganization and integration according to the principle of specialization and coordination as well as economic logic as a means of solving the problem of "large and all-inclusive" or "small and all-inclusive" enterprises, and the problem of enterprises being kept separate from one another; and to set up a rational organization structure consistent with the internal organization of industrial production and with the requirements of large-scale socialized production in order to promote productive forces. Marx held that socialism is built on a foundation of highly socialized production and a system of public ownership of the means of production. This system was established in our country long ago and has been constantly improved in practice. However, it must be admitted that the degree of socialized production is still insufficient, mainly because specialization and coordination through the division of work in production has not been well organized. Without specialized production, there will be no developed socialized production and the building of socialism will also be difficult. Therefore, effective industrial reorganization is an urgent task in implementing the policy of readjustment as well as a major issue of consolidation and development of the socialist system.

The so-called technical transformation means the gradual shifting of the existing enterprises to a modernized technical foundation through the constant renovation of production techniques and regular replacement of equipment, and the maximum effort to transform and arm the entire industry and various departments of the national economy with the fruits of scientific and technological achievements so as to generate more powerful productive forces. These are the basic requirements in developing industry's leading role and in accelerating socialist modernization. Industry produces not only consumer goods for people, but also the tools of labor. The level of technology and the quality of the tools of labor produced by industry for various sectors of the national economy have a direct bearing on the speed of their development. Therefore, technical transformation for industrial enterprises is a question of not only the amount of products supplied, but also, more important still, the grade of equipment used to equip the various sectors. We must set up and develop a modernized socialist industrial technological foundation before we can produce advanced tools of labor and use them to equip the various sectors of the national economy, to promote the speedy development of the entire national economy, and to meet the requirements of people's livelihood and the national construction. In other words, "only through the continued increase and improvement in socialist production on a highly technical foundation" can we "meet the constantly increasing material and cultural needs of the entire society to the maximum extent." Technical transformation is highly significant and must be carried out as determined by the basic socialist economic laws.

During the 32 years of socialist construction since the founding of the People's Republic, many plants have been set up in various localities. These plants are serving as strategic positions and reliable bases for our march toward and goal of the four modernizations. Because of the irrational organization structure of the industrial enterprises in the past, there have been many problems with duplicated constructions, dispersal of forces, "large and all-inclusive" and "small and all-inclusive" units, low-level management and poor economic results. As a result, the vast potential of enterprises cannot be fully tapped. If we want to readjust and reorganize our existing enterprises, we must act in accordance with the "eight-character" policy; concentrate our efforts on the production of urgently needed consumer goods and other brand-name and high-quality goods. We must use the key cities and trades as the bases regardless of the demarcations between different sectors and the systems of ownership; work out a unified plan for a rational division of work among the "over-fed" and the "under-fed" enterprises or the enterprises producing similar products or different products with similar technology, according to the nature of products, the accessory or spare parts used, or the work process and technology required. By this means, we will be able to change the orientation of production and the product mix among some enterprises, reduce the productive capacity for products already in excessive supply, and increase the production of goods in short supply. The organization can take the forms of specialized companies, general plants, or integrated economic units in various forms. It is also possible to set up comparatively stable relations of cooperation through economic contracts. By these means, we will be able to organize the productive capacity of the existing enterprises in a more scientific and rational way, and change the backward modes of production, such as those used in the "large and all-inclusive" and "small and all-inclusive" units, into that of socialized production through specialization and coordination.

At the same time, we should vigorously carry out technical innovation and transformation centering around the needs of production development. As we all know, the level of technology has a direct effect on the speed of production development, and the basic way to raise this level for production is to renovate the equipment and transform the technology in the existing enterprises, or to replace the old equipment--which is technically backward, physically unfit, and economically impracticable--with advanced and economical equipment. Marx pointed out: "The instruments of labor are largely modified all the time by the progress of industry. Hence they are not replaced in their original, but in their modified form." Again, he said: "The machinery must be cleaned from time to time. It is a question here of additional labor without which the machinery becomes useless." ("Collected Works of Marx and Engels" Vol 24, p 190, 194) These remarks made by the guru of revolution, on the one hand, showed that equipment replacement and technical transformation are required for the development of production and the continued progress of science and technology (or for the progress of society); and, on the other hand, served as an explicit reminder that we cannot overlook the maintenance and upkeep of the existing equipment. If we concentrate all or most of our resources on capital construction and try every possible way to start new projects instead of making use of the available foundation, we will not be able to bring into play the resources which we already possess, with reduced, instead of expanded, reproduction as the result. Even though the productive capacity may be increased, the old enterprises which use rundown plant buildings, out-dated equipment and backward technology, may eventually be eliminated so that finally, whatever we may gain cannot compensate our loss. While carrying out normal production, we must transform and renovate the old buildings and old equipment of the existing enterprises in a planned and systematic way and tap the potential of these enterprises to the maximum extent in order that our efforts will be doubly rewarded.

During the past 2 years, practical measures have been introduced in Jinan to deal with the problems left over from the past. First, some enterprises which were seriously operating under capacity and had little prospect of future development were merged or retooled to produce popular light and textile consumer goods. At the same time, attention was paid to the weak links in production, and necessary arrangements are being made for tapping potential and renovating and transforming the equipment so that the enterprises concerned will have the necessary support in making effective use of their industrial foundation for the development of their resources. In more than 2 years, 111 enterprises in the municipality were merged and retooled, while 253 others were integrated into 18 companies or general plants and 57 integrated economic units in various forms. This year, arrangements have been made for an investment of 91.38 million yuan in 151 projects for tapping the potential and renovating and transforming the equipment. By the end of August, 33 of these projects have been completed and commissioned, and it is anticipated that a total of 105 projects will be completed within this year. After 1 year's operation, these projects will help increase state revenues by 97.34 million yuan. Thus in the same year, the investment can be more than recovered. From this, we can see that while industry is being reorganized, equipment renovation and technical transformation among the existing enterprises is a practical step in "expanded reproduction through intensiveness." This type of expanded reproduction required less investment but actually yeilds quick results, and will help in saving time by accelerating the modernization of our country. It is entirely consistent with the way, proposed by the central government, which requires no heavy expenditures and high accumulations, but produces good economic results.

Practice has proved that enterprise reorganization and technical transformation are mutually supplementary and closely related. Their common goal is to resolve the sharp contradictions that may adversely affect the modernizations and high-level development of our production, or, in other words, to strengthen the weak links that may handicap the rational organization of production and the high-speed development of production by tapping the potential of the enterprises. If the enterprises are not reorganized in accordance with the principles of specialization and coordination or rational economics; and if the problem of having too many factories carrying out small-scale production, separating regions and departments from one another, and the existence of "large and all-inclusive" and "small and all-inclusive" units, are not solved, it will be impossible for us to organize and realize large-scale socialized production and extensively to popularize the use of advanced technology and equipment. On the contrary, if we are only concerned with the reorganization of enterprises and pay no attention to technical transformation, even the enterprises already engaged in specialized production according to the division of work cannot raise their productivity. Then the strong points of specialized production cannot be brought into play, and the fruits of enterprise reorganization cannot be consolidated. Specialization and coordination is the natural trend of development for modernized industry, as well as the objective requirement of the development of modern science and technology. New high-efficiency and high-level technology can be used to good advantage in mass production through specialization and coordination. The more highly developed are specialization and coordination, the more socialized will be production and the more modernized will be science and technology. This is the objective law of the development of productive forces. We must make every effort to study and master this law and use it to guide enterprise reorganization and technical transformation.
